Chromium, nickel and manganese alloys; Mn as an impurity. (To be continued.) (M27d; AY, *Cr, Ni, Mn*)

308-M.* Production of Dislocations During Growth From the Melt. W. A. Tiller. *Journal of Applied Physics,* v. 29, Apr. 1958, p. 611-618.

The segregation of solute on a microscopic scale during crystal growth leads to the introduction of dislocation lines into the crystal at the bounding surfaces of the segregate. A layer type of segregate resulting from platelet growth leads to dislocation densities of 10^0 to 10^8 lines per sq. cm. A cellular type of segregation resulting from cellular or dendritic growth leads to dislocation densities of 10^6 to 10^8 lines per sq. cm. in the crystal. 29 ref. (M26b, N12)

309-M.* Orientation Study of Ultra-Thin Molybdenum Permalloy Tape. P. K. Koh. *Journal of Applied Physics,* v. 29, Apr. 1958, p. 636-657.

Quantitative pole density stereograms of (111), (220), (200) and (113) poles of 1/8-mil Mo Permalloy tape were developed to establish its cold rolled deformation texture and annealed textures. (M26c, M23c, P16a, 2-64, 3-68; Fe, Ni, *Mo,* SGA-n)

310-M.* X-Ray Investigation of Perfection in Tin Whiskers. H. G. Smith and R. E. Rundle. *Journal of Applied Physics,* v. 29, Apr. 1958, p. 679-683.

Tin whiskers with elasticities far above that of bulk Sn were examined for perfection by X-ray diffraction. Intensities were measured for several whiskers varying in diameter from 2 to 11μ. The observed structure factors were corrected for extinction according to the dynamical theory of X-ray diffraction with the crystallite size as a parameter and then compared to the calculated structure factors. The agreement

with dynamical theory for imperfect crystals is very good, yielding a crystallite size of 1.5μ for a 5.5μ whisker and 2.7μ for whiskers of about 10μ in diameter. (M26n, M22g; Sn, 14-61)

311-M. Evidence of Dislocation Jogs in Deformed Silicon. William C. Dash. *Journal of Applied Physics,* v. 29, Apr. 1958, p. 705-709.

(M26b, 3-68; Si)

312-M.* Polygonization of Copper. F. W. Young. *Journal of Applied Physics,* v. 29, May 1958, p. 760-764.

Dislocations can be revealed as etch pits in Cu crystals doped with a small amount of Te. The progress of polygonization of such Cu after bending was followed with etch pits and X-ray diffraction. Climbing occurred at 500° C. and polygonization was complete after 2 hr. at 1000° C. In similar experiments with three samples of nominally 99.999% Cu, the one which was probably purest did not polygonize, while the other two did so. This indicates that if impurity is necessary for polygonization, only a very small amount is required. (M26n, M26b; Cu-a)

313-M. Structures of Metals and Alloys. Norman C. Baenziger. *Norelco Reporter,* July 10-17, 1957, p. 58, 72.

10 ref. (M25, M26)

325-M.* **Note on a Redetermination of the Aluminum-Gallium Equilibrium Diagram.** J. W. H. Clare. *Institute of Metals, Journal,* v. 86, May 1958, p. 431-432.

Thermal analysis was used to establish the form of the diagram. The system was found to consist of a simple eutectic with a eutectic temperature of 26.6° C.; the eutectic composition was not established. Metallographic and X-ray examination confirmed the existence of only two phases—Al and Ga. A tentative solidus was established down to 300° C. by a metallographic examination of annealed and quenched alloys. 4 ref. (M24b; Al, Ga)

326-M.* **Use of Thermal Expansion Measurements to Detect Lattice Vacancies Near the Melting Point of Pure Lead and Aluminum.** R. Feder and A. S. Nowick. *Physical Review,* v. 109, Mar. 15, 1958, p. 1959-1963.

Dilatometric and X-ray measurements of thermal expansion. For lead, results obtained by the two techniques agree within experimental error, which is interpreted to imply that the vacancy concentration at the melting point is 1.5×10^{-4}. For aluminum, dilatometric expansion appears to be slightly greater than X-ray expansion. If this discrepancy is real, it corresponds to a vacancy concentration at the melting point of Al of about 3×10^{-4}. The corresponding estimate for the formation energy of a vacancy in lead is 0.53 ev, and in Al, 0.77 ev. 26 ref.
(M26s, M21f, M23b, P11g; Pb-a, Al-a)

327-M.* **The Crystallographic Aspect of the Mechanical Twinning in Ti and Alpha-U.** Hiroshi Kiho. *Physical Society of Japan, Journal,* v. 13, Mar. 1958, p. 269-272.

It was found that {1122} and {1124} twins in Ti are reciprocal to each other and that the elements of {1121} twin are in agreement with Hall's result. 10 ref.
(M26c, Q24b; Ti, U)

328-M.* **Magnetic Effects on the Electron Diffraction Patterns From a Cobalt Crystal.** M. Blackman and E. Grunbaum. *Physical Society, Proceedings,* v. 71, May 1, 1958, p. 758-760.

Electron diffraction patterns taken on the prism face to a cobalt crystal showed a distortion due to the magnetic leakage field. The normal diffraction spots were replaced by a series of areas. When the primary beam was moved parallel to the edge of the crystal, the distorted pattern changed with a period characteristic of the domain spacing. On heating the crystal the magnitude of the distortion decreased, and became negligible at about 250° C.
(M22h, M26n, P16; Co)

329-M.* (French.) **Metallographic Study of Nickel and Nickel Alloys by Means of Local Polishing and Replica Techniques.** Pierre A. Jacquet. *Revue du Nickel,* v. 24, Jan-Feb-Mar. 1958, p. 1-10.

Use of electrolytic buffer for local polishing and etching, plus replicas such as made with nitrocellulose product called "Replic" (either plain or with sprayed-on aluminum film which provides greater reflective power), greatly facilitates nondestructive testing of parts at all stages of fabrication, as well as laboratory specimens. Results on Cr-Ni stainless steels and heat resistant alloys, Monel, annealed 70-30

cupro-nickel, nickel-clad steel and Nimonic alloys. 15 ref.
(M20; Ni, SS)

330-M. (Japanese.) **Electrolytic Polishing of Aluminum and Aluminum-Copper Alloy for Investigation of Microstructures.** Takuichi Morinaga, Yoshikazu Hosoi and Eiichi Sawato. *Light Metals (Tokyo)*, v. 8, Mar. 1958, p. 9-13.

331-M.* (Japanese.) **Effect of Manganese and Chromium on the Characteristics of Aluminum-Magnesium (3-5%) Alloys. Pt. 4.** Rihei Kawachi. *Light Metals (Tokyo)*, v. 8, Mar. 1958, p. 34-43.

Mechanical properties and macrostructure of Al alloy with 3 to 5% Mg, 0 to 0.75% Mn and 0 to 0.5% Cr, extruded at 1000 tons pressure to 4x40x40-mm. angle section. Mn and Cr bring about fibrous structure in the section; tensile properties are influenced by amount of fibrous structure and grain size; Mn, Mg, Cr increase strength; Mn and Cr decrease elongation. Properties may be considerably influenced by extruding temperature and preheating of ingot.
(M27, Q27, 2-60; Al, *Mn, Mg, Cr*)

332-M. (Russian.) **Properties of Atoms in Alloys of Transition Elements.** I. Ya. Dekhtyar. *Fizika Metallov i Metallovedenie*, v. 5, no. 1, 1957, p. 17-22.

Investigation of the magnetic characteristics of alloys of transition elements appears to be one of the methods for learning their electronic structure. Macroscopic values are obtained, but the characteristics of individual atoms cannot be determined by this method. Neutronographic analysis yields information on the structure of the electronic envelope of single atoms by evaluating disseminated neutrons. This mathematical consideration suggests further study by other means. 9 ref. (M25, P16)

333-M. An Investigation of the Me_5Si_3-MeSi Region of the Mn-Fe-Si and Some Related Systems. Bertil Aronsson. *Acta Chemica Scandinavica*, v. 12, no. 2, 1958, p. 308-313.

22 ref. (M24c, M22g)

334-M.* Studies of Aluminum-Rich Alloys With the Transition Metals Manganese and Tungsten. Pt. 1. The Crystal Structure of ε(W-Al)-WAl_4. J. A. Bland and D. Clark. *Acta Crystallographica*, v. 11, Apr. 10, 1958, p. 231-236.

The crystal structure of WAl_4 has been determined with moderate accuracy. The space-group symmetry was found to be Cm, and precision lattice parameters were measured. The heavy atom technique was used to find the approximate structure, and F_o syntheses were used in the refinement. The atomic arrangement is non-centrosymmetrical. 10 ref. (M26q; Al, *Mn, W*)

335-M. Studies of Aluminum-Rich Alloys With the Transition Metals Manganese and Tungsten. Pt. 2. The Crystal Structure of δ(Mn-Al)-Mn_4Al_{11}. J. A. Bland. *Acta Crystallographica*, v. 11, Apr. 10, 1958, p. 236-244.

Crystals of the triclinic alloy phase δ(Mn-Al) with an ideal formula $MnAl_{11}$ have been isolated from a ternary melt containing Zn. 19 ref. (M26q; Al, *Mn, W*)

336-M.* The Twist in a Crystal Whisker Containing a Dislocation. J. D. Eshelby. *Philosophical Magazine*, v. 3, May 1958, p. 440-447.

The twist due to a screw dislocation parallel to the axis of an isotropic cylinder of arbitrary cross section can be found from the solution of the ordinary torsion problem for the same cylinder. Some particular cases are worked out. Results are also valid for certain kinds of anisotropy. 13 ref.
(M26b; 14-61)

337-M.* Density Changes of Crystals Containing Dislocations. A. Seeger and P. Haasen. *Philosophical Magazine*, v. 3, May 1958, p. 470-475.

Zener's theory of the volume expansion of self-strained elastic bodies is applied to screw and edge dislocations in isotropic media. The important physical parameters entering are the pressure dependence of the shear modulus, and to a lesser extent, that of the bulk modulus. Numerical results for a number of materials. 13 ref. 372-M. (Rumanian.) **Application of Temperature Spectra as a New Method for the Study of Matter. Some Results for Iron and Steel.** Maria Bolgiu. *Studii si Cercetari de Metalurgie*, v. 2, no. 4, 1957, p. 415-424.

New method of thermodifferential analysis. The thermocouple junction in vacuum, taken as standard, is situated in the immediate neighborhood of the junction soldered to the specimen. The difference in temperature between the vacuum and specimen junctions is then determined only by specimen temperature variations. By optical recording and suitable amplification diagrams of the temperature difference as a function of the vacuum junction temperature, so-called "temperature spectra", are obtained that reveal the state of the specimen. 6 ref. (M23r; Fe, ST)

373-M. (Russian.) **Metallographic Study of Influence of Various Temperatures on Deformation of Aluminum Monocrystals.** L. I. Vasil'ev. *Scientia Sinica*, v. 7, Jan. 1958, p. 45-57.

17 ref. (M26s, Q24, 2-61; Al)

374-M.* **Etching of Germanium Crystals by Ion Bombardment.** G. K. Wehner. *Journal of Applied Physics*, v. 29, Feb. 1958, p. 217-221.

Study of etch effects produced by sputtering Ge crystals and bicrystals under normal incident low-energy (100 ev) Hg + ion bombardment in a low pressure plasma (1 micron gas pressure). Surfaces show preferentially etched pits which readily reveal the crystal orientation. 17 ref. (M20q; Ge)

375-M.* Phase Analysis of Alnico V Based on Temperature Effects. R. K. Tenzer and K. J. Kronenberg. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 302-303.

A magnetic analysis of composition of the two Alnico V phases. Structure-independence properties like saturation magnetization and temperature coefficient serve to indicate the correctness of alloys supposed to represent these phases. Model of two-phase structure is derived from electron micrographs. The combined saturation magnetization and the combined temperature coefficients are calculated using the measured properties of the single alloys. The two alloys whose combined properties come closest to those of Alnico V consist mainly of NiAl and Fe_2Co, respectively. 6 ref. (M23a; Al, Ni, SGA-n)

376-M.* Neutron-Diffraction Observations on the Palladium-Hydrogen and Palladium-Deuterium Systems. J. E. Worsham, M. K. Wilkinson and C. G. Shull. *Physics and Chemistry of Solids,* v. 3, no. 3/4, 1957, p. 303-310.

Neutron-diffraction investigations on powdered samples show that both hydrogen and deuterium atoms in beta-phase Pd-H and Pd-D are located in the octahedral positions of the Pd lattice. Results obtained for samples with low gas concentration are inconclusive in determining the atomic positions in the alpha phase, since at room temperature only a small amount of gas enters this phase. Although the vibrational amplitudes of hydrogen and deuterium are similar to those observed in other compounds, the total neutron-scattering cross-section for hydrogen in this system is abnormally low, indicating that the protons are more nearly free than in the other hydrogen compounds. 6 ref. (M24b, M22j; Pd, *H*)

377-M.* Examination of Sintered Aluminum Product Tubes. W. Evans. *Atomic Energy of Canada Ltd.,* CR MET-753, Mar. 1958, 15 p.

Metallographic examination of three samples of SAP tubing, two of Swiss origin and one of Alcoa M257 material. On annealing, the Swiss samples developed blisters. This is attributed to a high hydrogen content and its diffusion to an oxide-rich zone located near the outer surface of the tubes. The Alcoa M257 sample did not blister on annealing, and its microstructure was found to be satisfactory. (M27, 2-64, 9-71; Al, 6-70)

378-M.* (Japanese.) Change of Structure of Aluminum. Ikeno Takashi and Shibata Kizo. *Light Metals,* no. 30, May 1958, p. 11-14.

Change of structure due to heating at 450 and 600° C. of supercooled ingots of high-purity 99.99% Al and 1S and 2S Al alloys. Effect of heating on 1S and 2S ingots cast with tilting mold; relationship between the structure and surface pattern after rolling and anodic oxidation. (M27, 2-61, 3-68; Al)

379-M.* The Constitution of Alloys of Iron With Ruthenium, Rhodium, Palladium, and Silver. W. S. Gibson and W. Hume-Rothery. *Iron and Steel Institute, Journal,* v. 189, July 1958, p. 243-250.

Iron-rich binary alloys with Ru, Rh, Pd and Ag investigated by thermal analysis in the temperature range 1380-1560° C. (M24b; Fe, Ru, Rh, Pd, Ag)

380-M.* (French.) Interpretation of Microphotographs of Fractures. J. Plateau, G. Henry and C. Crussard. *Métaux Corrosion-Industries,* no. 392, Apr. 1958, p. 141-162.

Features observed on the photographs, obtained with the electron microscope, of surfaces showing cleavage, tensile, or intergranular rupture, for various steels and nonferrous alloys. While photographs permit a better understanding of the mechanism of the rupture propagation, there remain features not readily interpretable because of the insufficiency of the relief, which is often very marked. Authors propose to remedy this by using a stereographic apparatus. 12 ref. (M21e, Q26)

381-M.* (French.) A Micrographic Examination of Irradiated Uranium. J. Bloch and J. Bourgues. *Revue de Metallurgie,* v. 55, Apr. 1958, p. 339-344.

Initial results of study of uranium in first three sets of test bars removed from Saclay EL 2 pile. Under influence of irradiation U becomes markedly twinned and its hardness increases. In bars having given energies in excess of 200 MXj/t, U underwent profound changes in microstructure. Numerous fine twins are either curved or displaced through a shear phe-

nomenon; zones of recrystallization with fine, untwinned regular crystals are formed, these zones showing numerous fissures. 6 ref.
(M26s, 2-67; U)

382-M.* (German.) **Influence of the Degree of Purity, Casting Conditions and Deformation Temperatures Upon the Forming and Drawing Textures of Aluminum.** J. Grewen and G. Wasserman. *Metall,* v. 12, June 1958, p. 523-525.

The drawing textures of Al wires from continuous and mold castings are observed in relation to the degree of purity and fabrication temperature. On wires from continuous castings the double fiber texture <111> + <001> was always observed, the <111> portion increasing with lower purity and temperature. On wires from mold castings the tendency for the <111> position is favored and was often found exclusively. Tables for Al composition and percentages of fiber textures. 18 ref.
(M26c, 2-60, 2-61; Al, 4-61)

383-M.* **Intermetallic Compounds Between Lithium and Lead. Pt. 4. The Crystal Structure of $Li_{22}Pb_5$.** A. Zalkin and W. J. Ramsey. *Journal of Physical Chemistry,* v. 62, June 1958, p. 689-693.

The crystal structure of $Li_{22}Pb_5$ has been determined. The face-centered cubic cell contains 80 Pb atoms in space group F23; the cell constant is 20.08 A. The packing of the Li and Pb atoms is analogous to that found for LiPb, Li_3Pb_2, Li_3Pb and Li_7Pb_2; these structures resemble the body-centered cubic array present in Li metal, with the appropriate number of Li atoms replaced by Pb. 16 ref.
(M26q; Pb-b, Li)

384-M.* **Barium-Lithium Equilibrium System.** Douglas V. Keller, Frank A. Kanda and Alden J. King. *Journal of Physical Chemistry,* v. 62, June 1958, p. 732-733.

The X-ray diffraction pattern of $BaLi_4$ is in good agreement with a hexagonal cell having as its dimensions $a_0 = 10.92 \pm 0.01$ A. and $c_0 = 8.94 \pm 0.01$ A. with $c/a = 0.818$. The density was found to be 1.75 ± 0.05 g./cm^3 which requires a cell content of six molecules of $BaLi_4$. (M24b; Ba, Li)

385-M. Investigations on the Build-Up of the Sytsem Iron-Chromium-Carbon. Karl Bungardt, E. Kunze and Elizabeth Horn. *Archiv für das Eisenhüttenwesen,* v. 29, Mar. 1958 p. 193-203. (Iron and Steel Institute Translation no. 1019.)

423-M. Investigation of Alloys of Magnesium and Their Properties. Pt. 3. Development of Preferred Orientation in Wrought Magnesium Alloys. S. L. Couling. Dow Chemical Co. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131437, Sept. 1957, 33 p. $1.

A polarized-light metallographic technique capable of supplying information on the orientation of individual grains in a polycrystalline magnesium aggregate was developed and used in several orientation studies. Distribution of preferentially oriented grains in various extruded alloys. Elongated clusters of grains of one orientation alternate with clusters of another orientation throughout much of the extrusion thickness. Imhomogeneous flow or "banding" was found to be an important deformation mechanism during cold rolling of certain alloys and hot compression of alloy cylinders. (M26c, 2-64; Mg-6)

424-M. On the Compound Ni_2B in Nickel-Boron Alloys. N. I. Blok, M. N. Kozlova, M. F. Lashko and K. Ya. Shpunt. *Academy of Sciences of the USSR, Proceedings,* v. 114, 1957, p. 309-311. (Translation by Consultants Bureau, Inc.)

Structure and phase composition of Ni-B alloys containing from 0.01 to 2.5% B. Metallographic investigation of the cast alloys revealed that along the grain boundaries there was formed a uniformly etched phase which constituted a eutectic mixture with Ni. The alloy with 2.5% B is pre-eutectic. This phase has been isolated both chemically and by electrolysis. 4 ref. (M27; Ni, B)

425-M.* Point Defects in Platinum. G. R. Piercy. *Atomic Energy of Canada Limited,* CRMet 782, 68 p.

Mobility and type of point defect introduced in platinum by deformation in liquid nitrogen, quenching into water from 1600° C., or reactor irradiation at 50° C. In all cases the activation energy for motion of the defects was determined from measurements of electrical resistivity. Measurements of density, hardness, and X-ray line broadening were also made. Experiments indicated that the principal defects remaining in Pt after irradiation and quenching are single vacant lattice sites and pairs of vacant lattice sites, respectively. 20 ref. (M26s; Pt)

426-M.* Some Observations on the Identification of Compounds in the System Uranium-Aluminum. R. F. Hills. *Institute of Metals, Journal,* v. 86, June 1958, p. 438-441.

Uranium-aluminum alloys containing more than 31.2% Al exhibit at

room temperature an equilibrium structure of (UAl_4 + Al), the amount of UAl_4 being dependent upon the composition of the alloy. Alloys in the range 25.4-31.2% Al should consist entirely of (UAl_3 + UAl_4) with no free Al. The formation of UAl_4 in both these regions can be suppressed by rapid cooling through the critical range.
(M24b; U, Al)

427-M.* A Redetermination of the Liquidus of the System Lead-Magnesium in the Range 0-3 Weight Per Cent. Magnesium. G. W. Horsley and J. T. Maskrey. *Institute of Metals, Journal,* v. 86, June 1958, p. 446-448.

Determination was carried out by thermal, metallographic and chemical analysis. The composition of the eutectic lies between 2.25 and 2.30% Mg and its melting point is estimated to be 248.5 ± 0.25° C. 6 ref. (M24b; Pb, Mg)

428-M.* Oxygen Impurity in Silicon Single Crystals. A. Smakula and J. Kalnajs. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 46-49.

Comparison of the lattice constant and density of "pure" Si crystals and of oxygen-contaminated crystals favors the substitutional position of oxygen in the Si lattice rather than the interstitial. The spectral position and intensities of 15 infrared absorption bands for pure Si crystals are given. The bands shift slightly toward higher frequency at about −130° C., but no narrowing was detected. 25 ref.

433-M.* (French.) Preparation of Uranium Monocarbide and Its Relation to the Carbides of Refractory Transition Metals. H. Nowotny, R. Kieffer and F. Beneslovsky. *Revue de Metallurgie,* v. 55, May 1958, p. 453-458.

The monocarbide of uranium is of interest as a fuel in reactors. Solid solutions with other refractory carbides of groups 4a and 6a of the periodic system are characterized by great stability. Specimens obtained by fritting under pressure and examined by X-ray. A complete series of solid solutions is found in the UC-ZrC, UC-TaC and UC-CbC systems. Uranium carbide is also a good solvent for other carbides, particularly for VC, but its solubility is small. 11 ref.

434-M. (Russian.) Aluminum-Tantalum Systems. V. M. Glazov, M. V. Mal'tsev and Yu. D. Chistyakov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 4, 1956, p. 131-136.

Aluminum corner of the Al-Ta system investigated by microstructural, macrostructural, thermal and X-ray refraction methods. Alloys containing from 0.01 to 5.1% Ta were homogenized at 500° for one week and annealed in stages at temperatures from 200 to 630°, 40 hr. at each temperature. Dependence on alloy composition of the number of grains per sq.cm. of the surface of a macroscopic slide, of the microscopic hardness of the solid solution and the macroscopic hardness.
(M24b; Al, Ta)

435-M. (Russian.) **A Microscopic and X-Ray Study of Cobalt-Antimony Alloys.** N. N. Zhuravlev. *Kristallografiyal,* no. 5, 1956, p. 506-508.

Alloys up to 50 at.% Co were produced under an Ar atmosphere in quartz ampules. $CoSb_3$ has a b.c.c. unit cell with $a = 9.016 \pm 0.003$ kX; its structure belongs to one of two X-ray groups m_1 or m_3mF. The existence of the compounds CoSb and $CoSb_2$ was also established. Microhardness and specific gravity were measured for $CoSb_3$, $CoSb_2$ and CoSb.
(M26; Co, Sb)

436-M. (Ukrainian.) **Structure of a Liquid Bismuth-Tin Alloy.** O. S. Lashko. *Dopovidi Akademii Nauk Ukrains'koi S.S.R.,* 1957, p. 30-32.

From an X-ray study of liquid eutectic Bi-Sn alloy it was possible to construct monochromatic curves for the intensity of scattered radiation and curves for atomic distribution at 150 and 400°. At 150° the first maximum on the atomic-distribution curve occurs at 3.3 Å; at 400° it is displaced to 3.5 Å. Analysis of the curve points to the existence in the liquid alloy of small regions composed predominantly of atoms of one kind. At 150° the coordination number for Sn atoms is 10 and for Bi atoms 8.
(M25; Bi, Sn, 14-60)

437-M. (Ukrainian.) **Ternary Solid Solutions in the System Copper-Magnesium-Cadmium.** S. S. Cherkashin, P. I. Kripyakevich and D. P. Frankevich. *Dopovidi Akademii Nauk Ukrains'koi S.S.R.,* 1957, p. 33-37.

Alloys containing 10-66.7 at. % Cu were investigated by metallographic and X-ray methods. Ternary solid solutions are based on certain binary compounds in the systems Cu-Mg and Cu-Cd. The compound Cu_2Mg dissolves about 6 at.% Cd at 400°; at the same time the lattice parameter in the solid-solution field increases from 7.018 (for Cu_2Mg) to 7.040 ± 0.001 kX as a result of the replacement of the Cu atoms by Cd atoms, which have a larger size. The maximum solubility of Mg in the compound $CuCd_3$ is 48 at.%.
(M24c, Cu, Mg, Cd)

438-M.* **Direct Observation of Dislocations and Their Movement in Metal Foils.** P. B. Hirsch, R. W. Horne and M. J. Whelan. *Electron Microscopy, Proceedings of the Stockholm Conference,* Sept. 1956, p. 312-315.

(M21e, M26b, M26n; Al)

439-M. **Phase Analysis of Alloys Using the Radioactive Tracer Method.** E. Z. Vintaikin, P. L. Gruzin, Yu. A. Klyachko and A. P. Shotov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 179-184. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Procedure for determining chromium content in Cr-steel carbides, using the artificially radioactive isotope Cr^{51}. Relative error is 5-6%. Method makes it possible to obtain data on kinetics of carbide formation in the tempering of hardened Cr steel. The increase in Cr concentration in the carbide follows a straight line when plotted against the logarithm of the annealing time. 8 ref.
(M23q, N8a; ST, Cr, 14-63)

440-M. **Thermodynamics of Crystal Lattices With Vacancies.** N. S. Fastov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 265-274. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Under the effect of heat motion a number of atoms leave their positions in the crystal lattice and pass into intermediate positions either on the surface of the crystal or in internal microporosities. The result of this motion is the appearance of vacant positions (vacancies or holes) in the crystalline lattice. 8 ref.
(M26s)

441-M. **X-Ray Determination of the Characteristic Temperature of Chromium, Nickel and Molybdenum.** V. A. Ilyina and V. V. Kritskaya. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 275-276. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

The magnitude of interatomic binding forces in crystals is reflected by such constants as melting point, heat of sublimation, activation energy of self-diffusion and diffusion, characteristic temperature and elasticity modulus. These characteristics determine the materials capacity for maintaining regular crystalline

structure. The binding forces in Cr, Ni, Mo and Fe were determined by measuring the thermal factor of the intensity of X-ray interferences. The characteristic temperature was calculated from this factor. (M25h; Cr, Ni, Mo, Fe)

442-M. Investigation of the Variation of Intensity of X-Ray Interference Lines of Deformed Steel. V. A. Ilyina and V. K. Kritskaya. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 294-298. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Influence of plastic deformation on crystalline lattice. The intensity of X-ray reflections is considerably lower from deformed metals than from undeformed metals. Measurements at two temperatures (+23° and −185°) showed that the change in intensity (thermal intensity coefficient) resulting from a 200° reduction in temperature of the specimen varies equally for both deformed and undeformed iron. 10 ref. (M26, M22g, Q24; ST)

443-M.* (Czech.) **Potentiostat in Metallography.** Vladimir Cihal, Milan Prazak and Miroslav Holinka. *Hutnicke Listy*, v. 13, 1958, p. 496-502.

Problems of metallographic etching under conditions of controlled potential. Proposes potential values for selective etching of ferrite sigma phase, austenite and austenitic grain boundaries in 18-8 on basis of characteristic polarization curves of the individual phases. 14 ref. (M20q, X25h; SS)

444-M. (Russian.) **Equilibrium Diagrams of Ternary System Ni-Cr-W.** I. I. Kornilov. *Zhurnal Neorganicheskoi Khimii*, no. 4, 1957, p. 860-867.

Alloys containing up to 50% Cr and 30% W were studied by thermal and X-ray methods and by microstructure analyses. Increase in Cr content decreases the temperature of the start of crystallization, and alloys containing more than 40% Cr crystallize at 1350° as eutectic mixtures. The solubility of Cr in the solid solution of Ni containing 30% W is considerably less than in alloys with 10% W at all temperatures. (M24c; Ni, Cr, W)

445-M. (Russian.) **Interaction of Titanium Carbide With Metals of Iron Group.** V. N. Yeremenko. *Zhurnal Neorganicheskoi Khimii*, no. 9, 1956, p. 2131-2148.

Systems TiC-M(Ni, Co, Fe) were studied by thermal, metallographic, dilatometric, durometric (hardness measurement) and X-ray methods, and diagrams in the metal-rich range were plotted. The systems are of the eutectic type with limited TiC solubility. In the system TiC-Ni, eutectic is at 1280° and 9.3% TiC; the solubility of TiC in Ni is 6.2% at this temperature and 2% at 700°. In the system TiC-Co, eutectic is at 1360° and 6% TiC. Solubility of TiC in Co drops from 1% at 1360° to 0.15% at 700°. In the system Ti-Fe, eutectic is at 1460° and 3.8% TiC. (M24c; Ti, Ni, Co, Fe, C)

446-M. X-Ray Investigation of Interatomic Reactions in Solid Solutions With a Nickel Base. G. V. Kurdyumov and N. T. Travina. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 277-280. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Materials studied consisted of binary solid solutions of Ni with Cr, Ti or Al or quaternary Ni-Cr-Ti-Al alloy with the second phase separating from it during the disintegration of the solid solution. For a given atomic concentration the greatest increase of the binding strength is caused by Ti, next by Al and the smallest by Cr. The simultaneous effect of these three elements leads to a greater increase of interatomic binding strength than the individual effect in binary solid solutions. (M25l; Ni-b, *Cr, Ti, Al*)

447-M. Effect of Chromium on the Binding Forces in α-Iron Crystals. V. K. Kritskaya, G. V. Kurdyumov and T. I. Stelletskaya. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 281-283. (Available from U. S. Office of Technical Services, Washington, 25, D. C.)

Three Fe-Cr alloys containing 2, 8 and 16% Cr were investigated. The characteristic temperature and the variation of mean square deviation during thermal oscillations of atoms in the lattice of the solid solution were determined from the thermal factor of X-ray scattering by measuring the intensity of X-ray reflections at two different temperatures. (M25h, 2-60; Fe, *Cr*)

448-M. Binding Forces and Statistical Deformations in the Lattice of Alloyed Ferrite. V. A. Ilyina and V. K. Kritskaya. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 284-288. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

To study the effect of alloying elements on the variation of binding forces in ferrite crystals and on the magnitude of the statistical deformations of the lattice of the solid solution, alloys containing small amounts (up to 2%) of Mo, Cb, Mn, Co and V, were used. Measurements showed that, with the exception of V, all the alloyed elements increase the binding forces in ferrite crystals. 5 ref.
(M25h, 2-60; Fe-b *Mo, Cb, Mn, Co, V*)

449-M. Quasi-Binary Nature of a System of a Six-Component Nickel-Base Solid Solution With Titanium Carbide. I. I. Kornilov. *Doklady Akademii Nauk SSSR*, v. 119, no. 3, 1958, p. 501-503. (Henry Brutcher, Altadena, Calif., Translation no. 4269.)

Simplifying study of multicomponent metallic systems by reducing them to equilibrium among a limited number of phases (e.g. three). Eight-component system Ni-Cr-W-Mo-Cb-Ti-Al-C phase diagram obtained.
(M24d; Ni, Cr, W, Mo, Cb, Ti, Al, C)

450-M. (Russian.) **Chemical Nature of Ternary Intermetallic Phases in Systems Magnesium-Copper-Zinc and Magnesium-Copper-Nickel.** V. I. Mikheyeva and G. G. Babayan. *Doklady Akademii Nauk SSSR*, no. 4, 1956, p. 785-786.

The existence of chemical compounds MgCuZn and MgCuNi was established by measuring the electric resistance and its temperature factor in the regions of homogeneity of the solid phase in the systems Mg-Cu-Zn and Mg-Cu-Ni. The solid phases of these systems may be considered as ternary berthollides—phases containing the above-mentioned compounds in the state of dissociation or in the state of change of component valence.
(M24c; Mg, Cu, Zr, Ni)

451-M. (Russian.) **X-Ray Diffraction of Compounds in the Bi-Rh and Bi-Pd Systems in Connection With Superconductivity.** N. N. Zhuravlev and G. S. Zhdanov. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya*, no. 6, 1956, p. 708-713.

Bi-Rh system contains three intermetallic compounds: Bi-Rh, Bi_2Rh and Bi_4Rh. For isolated crystals of these compounds, data are determined on their crystalline structure, and also certain physical properties, including the temperature of transition to the superconducting state. (M22g, M24b; Bi, Rh)

452-M. (Russian.) **Phase Diagram of Binary System Titanium-Aluminum.** I. I. Kornilov, Ye. N. Pylayeva and M. A. Volkova. *Izvestiya Akademii Nauk SSSR, Otdelenie Khimicheskikh Nauk*, no. 7, 1956, p. 771-778.

Thermal, microstructure and X-ray diffraction methods, also analysis of hardness and heat resistance. Occurrence of peritectic transformations has been ascertained at 1520° (beta) + melt $\rightleftarrows$ gamma and at 1400° (gamma + melt $\rightleftarrows$ $TiAl_3$) and also a peritectoidal reaction at 1300° (beta + gamma $\rightleftarrows$ alpha). Solubility of Al in Ti at 1200° and 800° is, respectively, 26 and 21.6%.
(M24b; Al, Ti)

453-M. (Russian.) **Intermetallic Alloys of Platinum and Gold With Alkali and Alkaline-Earth Metals.** I. L. Sokol'skaya. *Zhurnal Tekhnicheskoi Fiziki*, no. 1, 1957, p. 127-129.

Study of specimens from the systems Na-Au, Na-Pt and Ba-Pt produced by heating a Au film in Na vapor by evaporating Pt in Na vapor, and by condensing Ba and Pt in a vacuum. The compound Na-Au proved to be a typical semiconductor with an exponential temperature dependence of resistance and an activation energy of 0.15 eV. In the systems Na-Pb and Ba-Pt, the existence of compounds could not be taken as fully demonstrated, though the experimental results support the assumption to a considerable extent.
(M24b, P15g; Na, Au, Pt, Ba)

454-M.* (French.) **Use of Bromine in Electron Metallography.** G. Henry, J. Pleatau and J. Philibert. *Comptes Rendus*, v. 246, May 12, 1958, p. 2753-2756.

Use of bromine as agent of dissolution of matrix of ferrous alloys, for preparation of direct carbon replicas; separation of replicas; methods of extraction, identification and analysis of precipitates and inclusions. (M20r, M21e)

455-M.* (Russian.) **X-Ray Study of Metallic Structure After Electro-Spark Treatment.** K. F. Starobudov and B. P. Kolesnik. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 434-441.

Study of phase changes and microhardness of surface layers of more than 100 combinations of V, Mn, Zr, Nb, C, Al, Fe, Ni, Cu, Zn, Cd, Sn, Pb and Bi, after electro-spark treatment. 9 ref.
(M21f, M27, G24a, Q29q)

456-M.* (French.) **Equilibrium Diagram of Uranium-Iron for Low Concentrations of Iron.** J. Bellot, A. Blanchon, R. Chazot, P. Dosiere, J. M. Henry and M. Colas. *Comptes Rendus,* v. 246, May 28, 1958, p. 3063-3065.

Study of U-Fe equilibrium diagram for alloys containing less than 0.3% Fe, with particular attention to curve of solubility of Fe in beta uranium. (M24b; U, Fe)

457-M. (Ukrainian.) **Revision of the Constitutional Diagram of the Iron-Arsenic System.** V. N. Svechnikov and A. K. Shurin. *Dopovidi Akademii Nauk Ukrains'koi S.S.R.,* no. 1, 1957, p. 27-29.

Study of Fe-As alloys containing 0.016-0.020% C and up to 12.6% As. Shape of liquidus and solidus curves and position of the two-phase (alpha + gamma) field establish that Fe-As alloys belong to the series with closed gamma-loop. The As contents of the gamma and alpha phases at the temperature of maximum solubility of As in ferrite (1150° C.) are 1.75% and 2.4% respectively. (M24b; Fe, As)

458-M. (Ukrainian.) **Study of a Polythermal Section of the Constitutional Diagram of the Ternary System Ti-Fe-C.** V. N. Eremenko, V. M. Bulanov and L. O. Gaevskaya. *Naukovi Zapiski Kievskogo Instituta,* no. 13, 1956, p. 119-124.

The TiC-Fe constitution diagram was studied in the region up to 16% TiC, by thermal, metallographic, dilatometric and X-ray structural analysis. The eutectic in the TiC-Fe system is at 1460° C. and 3.8% TiC. TiC increases the temperature of the gamma to alpha transformation in Fe, leading to the peritectoid reaction gamma (0.04% Ti) + TiC → alpha (0.15% TiC) at 920° C. Alloys containing more C than indicated in the ideal section TiC-Fe undergo eutectoid transformation at 695° C. Literature reviews on the systems Ti-Fe, Ti-C and TiC-Fe. 38 ref. (M24c; Ti, Fe, C)

463-M. (Chinese.) **Diffraction of X-Rays From Aluminum Single Crystals While Under Tension.** Yui Zhui-Khuan, Li Yui-Tszi, Tsui Khuei-Tszun and Se Kuan-Tsun. *Acta Scientia Natura,* no. 2, 1956, p. 185-202.

Al single crystals stressed in tension to various degrees of strain were studied by the Laue method. The effect of stress on the crystal appears to a much greater degree on Laue photographs obtained by back-reflection. At the outset of the stress process the asterism of the Laue spots is increased but at greater stress, saturation sets in. In back-reflection Laue photographs, the Debye diffraction rings are clearly defined while in photographs taken in the transmitted beam these rings

are not observed even at stress of 70%. It is concluded that during stress the crystal undergoes regular rotation of the crystallites which form due to the stress.

The mutual solubility of Cu and Co increases with increasing Pd contents. The heterogeneous region of the Cu-Co system is transformed into a triple system at room temperature, is gradually reduced with increasing content of Pd in the alloys and is closed at approximately 55% Pd. (M24c, Pd, Cu, Co)

469-M. Preferred Orientation of Cold-Rolled and Recrystallized Uranium Plate. W. R. McDonell. *U. S. Atomic Energy Commission DP-258,* 1958, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Preferred orientation induced by mild cold rolling after beta transformation was characterized by measurement of thermal expansion coefficients. It was estimated that cold reductions of 5 and 10% would cause elongations of one and two per thousand MWD/T, respectively, during irradiation of the plate. Recrystallization following cold work did not significantly affect the preferred orientation, but relieved intergranular stresses in the metal. The cold work and recrystallization reduced the grain size of the metal.

479-M. (Czech.) **Isolation of Carbides From Steel.** V. Toman, H. Tuma and N. Tietz. *Hutnicke Listy,* v. 11, no. 12, 1956, p. 738-740.

Preparation of the specimens, isolation and chemical analysis of the carbides, preservation of the carbides isolated and final analysis of the results. The shape and pretreatment of the specimens depend on the isolation method selected, but their surfaces must always be clean and edges rounded. Composition of, and method of using, electrolytes for anodic solution of the specimen; effects of electrolyte (composition), time and temperature on the analytical results. (M23, M26r; ST)

480-M. (Russian.) **Investigation of the Ni-S System From 30 to 50 At. %.** S. M. A. Sokolova. *Doklady Akademii Nauk SSSR,* v. 106, no. 2, 1956, p. 286-289.

The existence of the compound NiS in two forms is confirmed. Ni-rich alloys show metallic conductivity, while the alloys rich in S approach the semiconductor conductivity values. (M24b; Ni, S)

481-M. (Russian.) **Investigation of Alloys of the Palladium-Cobalt-Nickel System.** A. T. Grigor'yev, L. A. Pantelevmonov, Ye. M. Sokolovskaya, T. V. Bunina and M. V. Mastvugina. *Izvestiia Sektora Fiziko Khimicheskogo Analiza Institut Obschchei i Neorganicheskoi Khimii imeni Akademiia Nauk SSSR,* v. 27, 1956, p. 185-197.

Microstructure, hardness and electric resistance determined. Shape of liquidus and solidus curves of sections with constant Pd content and microstructure of the alloys indicate that the components of the ternary system Pd-Co-Ni form a continuous series of solid solutions. (M24c, M27, P15g, Q29n; Pd, Co, Ni)

482-M. (Russian.) **Equilibrium of Chemical Heterogeneity in Metallic Alloys at High Temperatures.** V. N. Svechnikov and B. A. Movchan. *Nauchnye Raboty Instituta Metallofiziki, Akademii Nauk Ukrainskoii SSR,* no. 7, 1956, p. 32-47.

Study of the distribution of W and Cr in steel KhVG in a condition of superheat by X-ray, microanalysis and autoradiography. Heating was carried to 1200, 1300 and 1400° C. and held for 30 min. in a protective atmosphere and under vacuum. After heating to 1400° C. the content of W at the surface of an intercrystalline fracture was more than twice the mean content of W in the steel. Micro X-ray analysis showed that the joints of the grains were enriched with Cr and W. Distribution of P in carbon steel, containing 0.04-0.25% C, by the process of homogenization was also studied.

A method of determining oxygen, dissolved in V, based on change it induces in the lattice constant, is proposed; figures tabulated for this change. 13 ref. (M26, S11g; V-a, *O*)

489-M.* (French.) **Quantitative Study of Dendritic Heterogeneity in Iron**

Alloys. Christian de Beaulieu and Jean Philibert. *Comptes Rendus,* v. 246, June 30, 1958, p. 3615-3618.

Variation of concentration between dendritic axes and interdendritic spaces observable by means of autoradiography can be determined quantitatively by pinhole studies made with Castaing micro-analyzer. It is then possible to standardize information obtained. In presence of carbon, elements are classified in following order of increasing heterogeneity: Mn, Cr, Mo, As.
(M27, N12b, M23q, Fe-a, *Mn, Cr, Mo, As*)

490-M.* (French.) **Superstructure in a Ti-Al 15% Alloy.** Adrien Saulnier and Maurice Croutzeilles. *Comptes Rendus,* v. 246, June 30, 1958, p. 3622-3625.

Electron micrographic and electron diffraction studies showed existence of an ordered compact hexagonal phase which is a Mg_3Cd type superlattice of the alpha solid solution. This phase appears in submicroscopic platelets parallel to faces $\{\bar{1}010\}$ of the solid solution. 5 ref.
(M27b; Ti-b)

491-M.* (French.) **Relationship Between the Purification of Aluminum and Its Susceptibility to Etching Reagents.** Gerard Wyon and Paul Lacombe. *Comptes Rendus,* v. 246, June 30, 1958, p. 3625-3628.

To confirm hypothesis that role of iron in etching of Al is decisive, a simple technique of purification by high vacuum melting and progressive solidification was developed, providing an almost totally pure specimen. Micrographic study of treated specimens confirmed effectiveness of elimination of iron impurity; grain subboundaries did not show etch figures. 15 ref.
(M27, M20q; Al-a, *Fe*)

492-M. (Russian.) **X-Ray Investigation of the Plasticity of Single Crystals of Beryllium.** R. I. Garber, I. A. Gindin, V. S. Kogan and B. G. Lazarev. *Izvestiia Akademii Nauk SSSR, Seriia Fizicheskaya,* v. 20, no. 6, 1956, p. 639-640.

X-ray diffraction, metallography and microinterferometry used to investigate single crystals of Be cut in the form of rectangular parallelepipeds, with one of the faces aligned with the plane of the base. Specimens were deformed by unilateral compression at temperatures from −253 to 800° C.
(M26, Q24; Be, 14-61)

493-M. (Russian.) **X-Ray Diffraction Investigation of the Surface Quality of Metals Treated by Grinding and Fine Cutting.** Yu. S. Terminasov, A. G. Yakhontov and A. V. Poltavskiy. *Izvestiia Akademii Nauk SSSR, Seriia Fizicheskaya,* v. 20, no. 6, 1956, p. 689-692.

X-ray diffraction (using the broadening and attenuation of the interference lines) and microhardness method used to study dependence of intensitiy of hardening on the metal surface and the distribution of hardening through the surface layer on the technological treatment conditions. Grinding or lathe cutting strengthens the surface layer of the metal, this being evidenced by an increase in the microhardness of 30 to 70%, a broadening of the diffraction lines by 100 to 200% and a reduction in the relative intensity of the lines by 40 to 70%, depending on the working conditions.
(M22g, Q23a, G17)

494-M. (Russian.) **Some Physical-Chemical Properties of Zirconium and Carbon Alloys.** G. V. Samsonov and N. S. Rozinova. *Izvestiia Sektora Fiziko Khimicheskogo Analiza Institut Obshchei i Neorganichesko Khimii imeni Akademiia Nauk SSSR,* v. 27, 1956, p. 126-132.

Roentgenographic and metallographic research and study of microhardness and electric conductivity established that Zr alloys containing 0.64 to 3.12% C by weight were two-phase alloys. The basic (hexagonal) phase is a solid solution of C in Zr, and the second (cubic) phase is a Zr carbide. Alloys containing 3.50 to 11.62% C are one-phase alloys and Zr carbides with the ZrC composition as a limit. Lattice spacing is given.
(M24b; Zr, C)

495-M. (Russian.) **Study of System Fe-Si Within the Range of Compound $FeSi_2$.** N. Kh. Abrikosov. *Izvestiia Sektora Fiziko Khimicheskogo Analiza Institut Obshchei i Neorganicheskoi Khimii imeni Akademiia Nauk SSSR,* v. 27, 1956, p. 157-163.

A part of the system Fe-Si in the range of leboite formation (phase of variable composition on $FeSi_2$ base) studied by thermal analysis, microstructure research, X-ray phases and thermo-emf. measurement of alloys hardened at 900 and 1000° C. A polymorphous transformation of $FeSi_2$ at 960-995° C. was discovered. (M24b; Fe, Si)

496-M. (Russian.) **Electron Diffraction Investigation of the Degree of Perfection of Germanium Single Crystals.** S. A. Seniletov and Z. G. Pensker. *Kristallografiya,* v. 1, no. 2, 1956, p. 209-213.

Crystals were ground with corundum powder or etched in boiling hydrogen peroxide. Electron diffraction patterns produced with ground crystals displayed Debye rings and spots, thus showing that when Ge is ground individual blocks are formed in the surface layer, turned by angles of approximately 2 to 3° C. relative to each other (mosaics) and minute crystals are torn off the surface. Individual blocks, forming in grinding (mosaics), penetrated to the crystal at a depth of 40 to 80 microns. (M26n, M22h; Ge, 14-61)

497-M. (Russian.) **Electron-Diffraction Investigation of the Structure of Thin Layers of Cadmium Sulphide, Selenide and Telluride.** S. A. Semiletov. *Kristallografiya,* v. 1, no. 3, 1956, p. 306-310.

Using point electron diffraction patterns, obtained from CdS, CdSe and CdTe films, various types of orientations of crystals of these compounds have been established relative to rock salt and mica. All the samples disclosed the presence of crystals of both modifications of the substances investigated, this being explained by the small difference in the lattice energy of these modifications. (M26q, M26r, M22h; Cd)

498-M. (Russian.) **Study of System Copper-Magnesium-Tin in Range of Cu-Cu_2Mg-CuMgSn.** Ye. Cherkashin, Ye. I. Gladyshevskiy and M. Yu. Teslyuk. *Izvestiia Sektora Fiziko Khimicheskogo Analiza Institut Obshchei i Neorganicheskoi Khimii imeni Akademiia Nauk SSSR,* v. 27, 1956, p. 212-216.

Structure of the system was studied microscopically and by X-ray. Alloys of the cross-section Cu_2Mg-CuMgSn are homogeneous in the range of 0 to 15 at.% Sn; along the cross-section Cu_2Mg-Sn the maximum solubility is 12 at.% Sn. The compounds Cu_2Mg and Cu_4MgSn do not produce any continuous series of solid solutions. The data of Sn solubility in Cu_2Mg are compared with the data of solubility of Be, Zn, Cd, Al, Si, Pb and Sb in Cu_2Mg and Cu. (M24c; Cu, Mg, Sn)

499-M. (Russian.) **Phase Composition and Phase Homogeneity Limits of Vanadium-Carbon Oxygen System. Pt. 1. Vanadium-Carbon System.** M. A. Gurevich and B. F. Ormont. *Zhurnal Neorganicheskoi Khimii,* v. 2, no. 7, 1957, p. 1566-1580.

Previously abstracted from original. See item 375-M, 1957. (M26r; V)

500-M.* **Further Observation on Grain Boundary Melting.** F. Weinberg. *Acta Metallurgica,* v. 6, Aug. 1958, p. 535-538.

Melting behavior of grain boundaries in bicrystals of Al and Zn. The melting temperature of the boundary was the same as that of the bulk material within an experimental uncertainty of 0.05° C. for Al and 0.02° C. for Zn. Bicrystals of Zn separated at the boundary before appreciable melting of the component crystals for boundary angles between 26 and 108°. Boundary melting and possibly boundary energy are significantly affected by the position of the boundary. (M27f, N3; Al, Zn)

501-M.* **Deformation Texture in Cold Drawn Nickel Rods.** K. Tangri and D. S. Eppelsheimer. *Indian Institute for Metals, Transactions,* v. 11, June 1958, p. 19-25.

New X-ray diffraction technique of texture determination which permits complete pole figure coverage with only one diffraction specimen. Deformation textures in 20.6, 40.5 and 60% cold drawn Ni rods are determined with the corresponding pole figures. The preferred orientation in cold drawn Ni may be described as a double fiber texture with [111] and [100] directions aligned along the fiber axis of the drawn rod. 5 ref. (M26c, M22g; Ni)

502-M.* (French.) **Improvements and New Applications of the Technique of Nondestructive Metallographic Examination.** P. A. Jacquet. *Revue de Metallurgie,* v. 55, June 1958, p. 531-554.

Electrolytes recommended for local polishing with buffer and how to use on cuprous metals, carbon steels, 18-8 stainless, light alloys, Mg alloys, Ti, U and Zr. Use of buffer in electrolytic etching. New, faster methods of drying replicas; improved techniques and materials for separation and mounting. Technique for preparation of replicas of small-diameter (2-mm.) wire. 18 ref. (M20)

503-M.* (Italian.) **A New Metallographic Etchant for Steels.** R. M.

Corelli. *Rassegna Chimica,* v. 10, Mar-Apr. 1958, p. 18-19.

Slow-acting solution of monochloroacetic acid and ethyl alcohol is more efficient than customarily used solutions in revealing structural constituents of ferrous alloys. (M20q; ST)

504-M. (Russian.) **Electron Diffraction Investigation of Alloys of Bi and Sb and of Certain Oxides of These Elements.** Z. G. Pinsker, O. S. Orekhvo and A. I. Miller. *Kristallografiya,* v. 1, no. 2, 1956, p. 239-240.

Electron diffraction investigation of thin layers of Bi and Sb, obtained simultaneously by condensation of vapors in vacuum at temperatures ranging from room temperature to approximately 100° C., disclosed an identical structure, corresponding to Sb or Bi with a lattice period *a* continually varying from 4.53 ± 0.01 (Bi) to 4.29 ± 0.01 A, and a period *c* varying 11.88 ± 0.02 to 11.24 ± 0.02 A. Annealing of specimens of all compositions at 200° C. for 15 hr. does not change the diffraction pattern, thus evidencing that it is impossible to attain order in the arrangement of the Bi and Sb atoms. (M22h; Bi, Sb)

505-M.* (English.) **Light-Figure Phenomena Revealed and Crystal Faces Developed by Chemical Etching in Copper and Alpha-Brass Crystals.** Mikio Yamamoto and Jiro Watanabe. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 240-250.

Light-figure phenomena of single crystals of Cu and alpha-brass etched with various chemical reagents. Crystal phases developed by etching; applicability of light figures for determination of crystal orientation. 5 ref. (M20q, M23; Cu, 14-61)

506-M. (Russian.) **Physicochemical Properties of Boron-Carbon Alloys.** G. V. Samsonov, N. N. Zuravlev and I. G. Amnuel'. *Fizika Metallov i Metallovedenie,* v. 3, no. 2, 1956, p. 309-313.

X-ray and microscopic study, as well as measurement of electrical resistance and density of boron-carbon alloys with 5 to 72.5% C. Above 5% C, an imperfect structure of the carbide $B_{13}C_2$ developed, which was characterized by vacant places on the c-axis in the $B_{13}C_2$ lattice. (M26r; B, C)

507-M. (Russian.) **Activity of Sodium in Alloys of Ternary System Tin-Sodium-Zinc.** A. G. Morachevskiy. *Nauchno-Tekhnicheskii Informatsionnyi Byuleten' Leningradskogo Politekhnicheskoko Instituta,* no. 3, 1957, p. 12-19.

Activity was computed using the results of measurement of the emf. of concentration chains of the amalgam type. Water glass (3.8% Na_2O) was used as the electrolyte. Small amounts of Zn do not essentially influence the activity factor of Na in alloys with Sn. The activity factor of Na starts to rise noticeably at the increase of Zn concentration. (M24c; P12b; Sn, Zn, Na)

508-M. (Russian.) **Mechanism of Formation of Through Impact Figures in Zinc.** A. A. Urusovskaya. *Trudy Instituta Kristallografii, Akademii Nauk, SSSR,* v. 12, 1956, p. 180-185.

When the surface of the base of a single crystal of Zn is struck with a needle, a hexahedral cavity appears, outlined by tracks of twin streaks. On the opposite side of the plate, a hexagonal pyramidal projection appears, turned relative to the crater on the upper surface by an angle of 30°. If the outline of the cavity on the surface of the base on which the impact is made corresponds to the tracks of the planes of a pyramid of the first kind (1012), then the outline of the projection corresponds to the trace of the planes of a pyramid of the second kind (1122). (M26n, Q6; Zn, 14-61)

509-M. (Russian.) **Constitution Diagram and Properties of Alloys of the System Ni-Ti.** L. I. Pryakhina. *Trudy Instituta Metallurgii, Akademiia Nauk SSSR,* v. 2, 1957, p. 119-125.

System investigated by microstructure, specific electric resistivity, and hardness. A region of limited gamma solid solution of Ti in Ni is established at 800° C. The curve of solubility of Ti and Ni at 800° C. passes between the compounds with 8 and 10.8% Ti. Diagrams of composition versus electric resistivity, hardness and refractoriness plotted and studied for alloys of the Ni-Ti system (containing up to 16% Ti). (M24b; Ni, Ti)

510-M. (Russian.) **Investigation of Alloys of the System Ag-Mn-Al.** D. A. Petrov and A. Ya. Potemkin. *Zhurnal Neorganicheskoi Khimii,* v. 2, no. 7, 1957, p. 1552-1565.

Constitution diagram was plotted for the Ag-corner of the system

Ag-Mn-Al up to 10% Al and up to 30% Mn. The liquidus surface consists of three fields of primary crystallization of phases alpha, beta and Mn. There exist three nonvariant equilibriums in the Ag-corner of the Ag-Mn-Al system. Saturation limits of the alpha solid solution in a silver base determined approximately; distribution of the phase regions at temperatures of 700, 600, 400, 200 and 20° C. Properties of the alloys of Ag with Mn and Al; electric resistivity and hardness depend on composition of the alloys. (M24c; Ag, Mn, Al)

511-M.* Microscopic Observations of the Surface of InSb Monocrystals. J. Auleytner and B. Kolakowski. *Acta Physica Polonica,* v. 17, 1958, p. 93-109.

Observations of etched and cleaved surfaces with crystallographic indices (100), (111) and others. Shape of the etch pits is different for the various crystallographic surfaces. Two types of etched figures were observed; they differ in size and in density. 7 ref. (M26s; In, Sb)

512-M.* Structure of Epitaxed Copper Deposited by Evaporation Onto a Clean (00.1) Face of a Titanium Crystal. R. E. Schlier and H. E. Farnsworth. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 271-276.

Titanium crystal was cleaned by heating, ion bombardment and annealing in high vacuum. Low-energy electron diffraction was used to determine that the surface was essentially free of contamination and to make structure determinations. The Cu deposits varied in average thickness from 0.5 to 25 atomic layers. The Cu formed at nucleation centers in the form of discrete oriented crystallites with a lattice spacing parallel to the substrate which was the same as that of the (111) plane in the bulk Cu and with the (110) azimuth of Cu parallel to the (11.0) azimuth of Ti. 11 ref. (M26; Cu, Ti)

513-M.* Some Grain Boundary Characteristics in Babbitt and Tin. P. G. Deo and B. D. Sharma. *Scientific and Industrial Research, Journal,* v. 17, July 1958, p. 248-251.

Polycrystalline babbitt and Sn etched under cathodic sputtering and by chemical means are examined by high-resolution microscopy and multiple-beam interferometry. Comparative results obtained on the grain boundaries of cast surfaces indicate that these level differences are due to the deformation of the grains caused by the temperature variation. 5 ref. (M21c, M27f; Sn, Sb)

514-M.* (Czech.) Practical Possibilities of the Use of Lattice Quantitative Metallographic Analysis. Zdenek Ministr. *Hutnicke Listy,* v. 13, no. 7, 1958, p. 598-603.

Quantitative metallographic analysis in addition to its own relative errors has inaccuracies depending upon resulting capacity and focusing. Special reference to porous materials. Examples of conversion of volume parts to weight parts in two or more component structures. (M23)

515-M. (Russian.) X-Ray Diffraction Investigation of Several Alloys of Transition Metals With Silicon. Ye. I. Gladyshevskiy, P. I. Kripyakevich and Yu. B. Kuz'ma. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 454-456.

Investigation was made of sections of Mn_3Si-Fe_3Si, Mn_3Si-Co_3Si, Mn_3Si-Ni_3Si, and Mn_3Si-Cu_3Si. The Mn_3Si and Fe_3Si compounds form with each other a continuous series of solid solutions. In the Mn-Co-Si system there was found a Co_2MnSi compound of a CsCl-type ($a = 2.827 \pm 0.001$ kX). No triple compounds of the types CsCl, BiF_3 or Cu_2MnAl are observed in the Mn-Ni-Si and Mn-Cu-Si systems. (M24, M22g; Si)

516-M. (Russian.) Study of Alloys of Gold-Cobalt System. A. T. Grigor'yev, Ye. M. Sokolovskaya and M. V. Maksimova. *Zhurnal Neorganicheskoi Khimii,* v. 1, no. 5, 1956, p. 1047-1051.

Studied by thermal analysis, microstructure, hardness and electric resistance. Au with an admixture content under 0.01% and Co containing 0.01% carbon were used as initial materials. Au and Co produce a simple graph with a eutectic at 10% Co and temperature of 995° C. The solubility of Co in Au and of Au in Co is 8 and 6% at 995° C. and 5 and 5% at 900° respectively. (M24b; Au, Co)

517-M. Beta-Wolfram Structure of Compounds Between Transition Ele-

ments and Aluminum, Gallium and Antimony. E. A. Wood, V. B. Compton, B. T. Matthias and E. Corenzwit. *Acta Crystallographica,* v. 11, Sept. 10, 1958, p. 604-606.
13 ref. (M26q; Al, Sb, Ga)

518-M. The Crystal Structure of a M_2B_3-Type Double Boride. H. J. Beattie, Jr. *Acta Crystallographica,* v. 11, Sept. 10, 1958, p. 607-609.

A new boride structure has been found in alloys HS-88 and Incoloy 901, each with around 0.1% B addition. The borides were extracted electrolytically from unaged specimens and examined by X-ray powder analysis. Small amounts of TiC were also present in both extracts. Incoloy 901 without B does not produce this structure.
(M26r, Ni-b, *B*)

519-M. On the Distribution of Impurity Atoms in the Stress Field of a Dislocation. D. N. Beshers. *Acta Metallurgica,* v. 6, Aug. 1958, p. 521-523.

Impurity atoms distributed in the stress field of a dislocation obey Fermi-Dirac statistics. Result is applied to two experimental situations. The binding energy of an impurity to a dislocation is determined. 5 ref. (M26b, 3-69)

520-M. X-Ray Diffraction Studies of a Binary Alloy Containing Metals With Dissimilar Crystal Structures, Valences and Ionic Radii. G. P. Chatterjee, J. K. Mukherjee and K. C. Som. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 219-225.

Forms of the intermetallic compound Cu_2Mg are interpenetrating type f.c.c. structure with 8 molecules per cell. The lattice structure is similar to but not exactly like the f.c.c.-ZnS type; the lattice parameter is ao = 7.064 Å; the lattice bond of Cu_2Mg is not truly metallic. 4 ref. (M26q, Cu, Mg)

521-M. Studies on Surface Structure by Electron Diffraction. A. Goswami. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 227-236.

Surface structure and crystal growth process in electrodeposition, oxidation reaction and corrosion phenomena. 18 ref.
(M22h, N12d, R1)

522-M. Electron Microscopy. A. R. Deo and M. K. Gharpurey. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 237-245.

Techniques of specimen preparation. Plastic replicas give poor resolution. Silica replicas as well as anodic aluminum oxide replicas permit a resolution of about 100 Å, while with carbon a resolution better than 50 Å has now been reported. 11 ref. (M20r, M21e)

523-M. Interfaces Between Metallic Crystal Grains. G. P. Chatterjee. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 275-284.

Relationships between temperature, surface tension and composition of homogeneous binary alloys considered thermodynamically. 8 ref. (M27b)

524-M. Preparation of Tin and Tin Alloys for Micro-Examination. B. L. Eyre. *Metallurgia,* v. 58, Aug. 1958, p. 95-106.

Techniques used at the Tin Research Institute, based on conventional grinding and polishing techniques, using specially selected abrasives and polishing cloths. Diamond abrasives are employed for the major part of the fine polishing. 13 ref. (M20p; Sn)

525-M. (German.) **Screw Dislocation in Alkali Metals Treated According to Lattice Theory.** Chr. Lehmann and G. Liebfried. *Physics and Chemistry of Solids,* v. 6, Aug. 1958, p. 195-204.

528-M.* Activities in the Chromium-Nickel System. M. B. Panish, R. F. Newton, W. R. Grimes and F. F. Blankenship. *Journal of Physical Chemistry,* v. 62, Aug. 1958, p. 980-982.

Chromium activities in the Ni-Cr system were obtained from the potentials between Cr and alloy electrodes in an electrolyte of molten NaCl-RbCl mixture containing about 0.5% $CrCl_2$. Seven alloy com-

positions ranging from 11 to 96 at. % Cr were studied at 750° and the 53 and 96% alloys also at 965°. The activity coefficient of Cr at 750° ranges from about 0.5 to 1.0 as the Cr concentration increases to 30%, then increases sharply as the miscibility limit at 40% is approached. (M24b, P12b; Ni, Cr)

529-M. The Uranium-Nitrogen-Carbon System. Alfred E. Austib and Arnold F. Gerds. Battelle Memorial Institute. *U. S. Atomic Energy Commission BMI-1272,* June 23, 1958, 18 p.

System studied at 1800° C. under vacuum and under a 1-atm. nitrogen pressure. There is complete solid solubility between UN and UC, and essentially no solid solubility of nitrogen in UC_2 or U_2C_3 or of carbon in U_2N_3. 9 ref. (M24c; U, N, C)

530-M.* (English.) **Oxidation Method of Determining Austenitic Grain Size in Mild Steel.** P. Szeki. *Acta Technica,* v. 21, no. 1-2, 1958, p. 79-86.

Simple method developed austenitic grain boundaries within 20 to 25 min. by heating prepared metallographic specimens in a tubular furnace in a stream of industrial nitrogen. Oxygen present in the industrial gas oxidizes grain boundaries of austenite. Method used to investigate austenitic grain size of a mild steel at 970 to 1170° C. The temperature of austenitic grain coarsening and the calculated solution temperature of AlN were in good accord. 4 ref.

532-M. Electron Metallography of the Al-Ni-U Bond. Carl L. Angerman, E. I. du Pont de Nemours & Co. *U. S. Atomic Energy Commission, DP-248,* Dec. 1957, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

The diffusion zones formed during the bonding of Ni plated U cores to Al sheaths were identified by correlating the appearance of these zones with those identified in diffusion couples. A relationship between the structure and the strength of the bond was observed. 13 ref. (M21e, K5k, Ni; Al, U, *Ni*)

533-M. Measurement of the Absolute Energy of Low-Angle Dislocation Boundaries in Zinc. R. B. Shaw, T. L. Johnston, R. J. Stokes, J. Washburn and E. R. Parker. California University Institute of Engineering Research. *U. S. Office of Technical Services,* PB 126531, May 1956, 32 p. (Available at Library of Congress, Washington, D. C.) Microfilm $3, photocopy $6.30.

Theoretical study on dislocation boundaries, combined with microscopic examination of a low-angle boundary in a small tapered Zn crystal which was heated to within a few degrees of the melting point. (M26b, P12; Zn)

534-M.* (German.) **Rolling Textures of Transformer Sheet.** Hermann Moeller and Helmut Staeblein. *Archiv für das Eisenhüttenwesen,* v. 29, June 1958, p. 377-390.

Using a Geiger counter X-ray diffraction goniometer of an improved design with monochromatic radiation from lithium fluoride the cold, hot and cross rolling textures of steel with 2.65% and 2.85% Si were investigated and pole figures were determined. Both strain and compression textures were found, verifying former observations. Through the utilization of monochromatic radiation a better relation between line intensity and background was obtained, eliminating the distorting effects of influence. 36 ref.
(M26c, F23; AY, Si, SGA-n)

535-M.* (German.) **Cubic Position as a Recrystallization Texture in Iron-Silicon Alloys.** Hans-Eberhard Mobius and Franz Pawlek. *Archiv für das Eisenhuttenwesen,* v. 29, July 1958, p. 423-437.

Formation of perfect cubic positions in the secondary recrystallization process from a prepositional structure in the (110) [001] and (100) [001] planes is observed step by step. The influence of Si content (1.8 to 2.2%) and intermediate heat treatments upon formation of the texture is analyzed. 24 ref.
(M26c, N5; Fe, *Si*)

536-M.* (German.) **Recrystallization Texture in Cold-Rolled Transformer Sheet.** Helmut Staeblein and Hermann Moller. *Archiv für das Eisen-*

hüttenwesen, v. 29, July 1958, p. 433-447.

X-ray photographs were taken and pole figures developed in the (110) and (200) planes on primary and secondary recrystallization textures of materials with 0.052% and 0.011% C and 2.65% Si. The influence of rate of deformation, annealing temperature between 500 and 1300° C. and carbon contents particularly upon the texture [100] (011). 39 ref. (M26c, N5; ST, SGA-n)

537-M.* (German.) **New Observations on Sub-Grains of Aluminum.** Dietrich Altenpohl. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 331-342.

Sub-grains were observed on Al by means of X-rays as well as light and electron microscopes. Sub-grains of 1 micron appear mainly after plastic deformation of polycrystalline structures. At 183° C. no subgrains were observed. Apparently in the recrystallized state an accumulation of impurities along the sub-grain boundaries takes place, consisting of iron and hydrogen and probably copper atoms. Various theories on the development of subgrain structures. 45 ref. (M27c; Al)

538-M.* (Polish.) **Thermodynamic Characteristic of Intermetallic Phases of the Daltonide and Berthollide Type.** Janusz Terpilowski and Wlodzimierz Trzebiatowski. *Archiwum Hutnictwa,* v. 3, no. 2, 1958, p. 97-112.

Electrochemical data were used to calculate changes of such partial molal thermodynamic values as thermodynamic potential, entropy and enthalpy for the less noble components within the range of intermediate phases for the metallic systems: Ag-Cd, Au-Cd, Cu-Zn, Bi-Tl and Pb-Tl. On the basis of previous work it was found that calculated thermodynamic values in the limits of existence of the beta and epsilon phases for Au-Cd system and gamma phase for systems Ag-Cd, Cu-Zn were characteristic for phases of the daltonide types. Remaining phases were Berthollide type. 36 ref. (M26q, P12; Ag, Cd, Au, Cu, Zn, Bi, Tl, Pb)

539-M.* **The Aluminum-Rich End of the Aluminum-Vanadium System.** D. M. Bailey, O. N. Carlson and J. F. Smith. *American Society for Metals, Transactions,* v. 51, Preprint no. 81, 1958, 6 p.

Aluminum-vanadium phase diagram revised on the basis of additional X-ray and thermal data. A new intermetallic compound, α' (Al-V), with a formula close to that of Al_7V, was found to undergo peritectic decomposition at 688° C. A peritectic horizontal was established at 661.9° C. in the Al-rich end of the diagram. 10 ref. (M24b; Al, V)

540-M.* **Lattice Parameters of Uranium From 25 to 1132° C.** P. Chiotti. H. H. Klepfer and R. W. White. *American Society for Metals, Transactions,* v. 51, Preprint no. 83, 1958, 12 p.

Lattice parameters of U were measured by X-ray diffraction techniques over the range from room temperature to 1060° C. Atomic volume and density as functions of temperature. The change in volume for the alpha-beta transformation was calculated to be 1.12% and for the beta-gamma transformation, 0.70%. 13 ref. (M26, 2-61, N6p; U)

541-M.* **The Constitution of Rhenium-Tungsten Alloys.** J. M. Dickinson and L. S. Richardson. *American Society for Metals, Transactions,* v. 51, Preprint no. 88, 1958, 12 p.

Constitutional diagram proposed. Two intermediate phases were found. Sigma phase formed peritectically at 3000° C. and chi phase formed peritectoidally at 2125° C. A eutectic was found at 74% Re and 2825° C. W dissolved up to 37% Re and Re up to 20% W. 5 ref. (M24b; Re, W)

542-M.* **Metallographic Identification of Inclusions in Uranium.** George L. Kehl, Eric Mendel, Emilio Jaraiz F. and Melvin H. Mueller. *American Society for Metals, Transactions,* v. 51, Preprint no. 100, 1958, 14 p.

Identification of UN, U(C,N), UC, UO, UH_3, UO_2 and U_6Fe. True identity of various inclusions established by removing the inclusion with ultrasonic "jack hammer" and subjecting debris so created to X-ray diffraction analysis. Metallographic examination established on the basis of time required to electroplate the inclusions with Cu and on the character of the Cu deposits. 8 ref. (M23, M22g; U, 9-69)

543-M.* **An X-Ray Metallographic Study of Arc-Cast Tungsten.** Sam Leber. *American Society for Metals, Transactions,* v. 51, Preprint no. 103, 1958, 12 p.

Double crystal X-ray diffraction camera techniques can be used to provide a complete analysis of the distortions of the lattice planes within crystals. Data obtained from two arc-cast tungsten grains are used to describe the modes of distortion, misorientations across subboundaries, character of subboundaries, etc. An X-ray micrographic technique is presented as an aid in determining the spatial and orientation relationships between subgrains. 13 ref. (M26, M22g; W)

544-M.* Shape, Size and Growth of Some Intermetallic Compounds in Liquid Bismuth. P. J. Barton and G. W. Greenwood. *Institute of Metals, Journal,* v. 86, Aug. 1958, p. 504-509.

Shapes and sizes of particles of binary intermetallic compounds of U, Th, Ce, Zr, Mg, Ca, Sr, Ba, Te and Se with bismuth studied metallographically with respect to their mode of preparation, after isothermal treatment in liquid bismuth, under changes in temperature and on precipitation from solution. 16 ref. (M26q; Bi, 4-60)

545-M.* Preferred Orientation in Thorium. L. K. Jetter and C. J. McHargue. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 161-185.

Deformation fiber texture of extruded Ames Th was found to be <111>. Recrystallization occurring during the fabricating process produced <001> or <114> fiber textures. 13 ref. (M26c, N5; Th)

546-M.* Metallography of Thorium. H. P. Roth. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 282-295.

Mechanical polishing, electrolytic polishing and etching. Typical microstructures illustrate structural changes due to differences in composition and treatment of the metal. 11 ref. (M27, M20; Th)

547-M.* The Constitution of Thorium Alloys. F. A. Rough, Arthur A. Bauer and H. A. Saller. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 316-351.

Data for the following alloy systems: Th-Al; Th-Be, Th-B, Th-C, Th-Cr, Th-Cu, Th-Au, Th-Hf, Th-Pb, Th-Ni, Th-Nb, Th-Se, Th-Ag, Th-Ti, Th-V, Th-U, Th-Zr, Th-Bi, Th-Ca, Th-Ce, Th-Fe, Th-Mn, Th-Mo, Th-W, Th-Zn and Th-Ta. 78 ref. (M24; Th)

548-M. (Chinese.) **Formation and Development of a Secondary Structure in Aluminum Crystals Deformed at High Temperatures.** Liu I-khuan' and Tso Tzsutzsun and Uli Sieubao. *Acta Physica Sinica,* v. 12, no. 6, 1956.

Formation of a secondary structure in Al on deformation at high temperature studied by X-ray and metallographic methods. Single crystal and polycrystalline specimens of 99.67% pure Al were subjected to stretching at 200-630° C. at various speeds. Formation of the secondary structure is a result of deformation of the crystalline structure. Grain size of the secondary structure depends on temperature and speed of deformation; lowering the speed of deformation and increasing temperature causes a coarsening of the grain of the secondary structure. (M27c, 3-68; Al)

549-M. (Chinese.) **Investigations of the Lithium-Carbon System.** P. I. Fyodorov and Su Myan'-Tszen. *Khusiue Siuebao,* v. 23, no. 1, 1957, p. 30-39.

System within the limits Li-Li_2C_2 studied by thermal and X-ray structural analyses. Alloys were prepared and cooling curves recorded in an argon atmosphere. A eutectic is formed at 1% C and a temperature of 165° C. By determining the boiling points, the vapor pressure of pure Li and of alloys containing up to 15% C at 790-950° C. was found. At higher temperatures the liquidus was determined by the vapor pressure isobars. Li_2C_2 has some polymorphic modifications with transformation temperatures at about 410, 440 and 560° C. (M24b; Li, C)

550-M.* (French.) **Lamellar Structure of a Thin Film of the Eutectic Alloy of Aluminum and Copper Observed in the Electron Microscope.** N. Takahashi and K. Ashinuma. *Comptes Rendus,* v. 246, June 23, 1958, p. 3430-3433.

Pronounced lamellar structure was found in eutectic of 33% Cu and 67% Al (by weight) by direct observation by transmission electron microscopy. This structure was observed in all specimens examined, indicating that the ratio of components of this alloy remains invariable both in thin film and in massive state. Transformation due to heating was also observed. (M27d, M21e; Al, Cu, 14-62)

551-M. (Russian.) **Phases of the System Tungsten-Boron.** G. V. Samsonov.

Doklady Akademii Nauk SSSR, v. 113, no. 6, 1957, p. 1299-1301.

Alloys containing 0.9-81.4 at.% B, obtained by hot pressing, were studied by microhardness, X-ray and metallographic analyses. The following phase zones were found: solid alpha-solution of B in alpha-W (maximum hardness 550-770 kg. per sq. mm.); alpha + gamma (W_2B), extending to 33.3 at. %B, hardness of W_2B 2420 kg. per sq.mm.; with several others. (M24b; W, B)

552-M. (Russian.) **Lattice Parameter of Pure Metallic Vanadium and Effect of Oxygen on Change of Parameter.** M. A. Gurevich, B. F. Ormont. *Fizika Metallov i Metallovedenie*, v. 4, no. 1, 1957, p. 112-114.

Lattice parameter of V obtained by different methods; comparison with results of other investigators. For pure V the value $a = 3.024 + 0.001$ Å is proposed. A table gives the relation of a to the dissolved oxygen content (up to 3.2 at. %). (M26n; V)

553-M. (Russian.) **Metallographic and X-Ray Study of Alloys of the System Antimony-Iridium.** R. N. Kuz'min, G. S. Zhdanov and N. N. Zhuravlev. *Kristallografiya*, v. 2, no. 1, 1957, p. 48-50.

Alloys of chemically pure Sb and Ir were prepared by fusing or sintering under a small positive pressure of argon. Melting points were found by cooling curves recorded on electronic automatic potentiometer and also by the method of drop formation. Possible phase diagram of the system Sb-Ir was plotted. At 615° C. near pure Sb the eutectic reaction takes place. Existence of the compounds $IrSb_3$ and $IrSb_2$ was established. (M24b; Sb, Ir)

554-M. (Russian.) **Phase Diagram of the System Mg-Mn.** D. A. Petrov, M. S. Mirgalovskaya, I. A. Strel'nikova and E. M. Komova. *Trudy Instituta Metallurgii Akademiia, Nauk SSSR*, no. 1, 1957, p. 142-143.

Alloys containing up to about 5% Mn were studied. The solubility of Mn in liquid Mg was determined by thermal analysis. At 850, 790, 760, 710 and 670° C. it is 4.95, 3.83, 3.11, 2.58 and 2.10% respectively. The solubility of Mn in solid Mg was determined by microstructural analysis and microhardness measurement. The non-variant 3-phase reaction at 653° C. was determined as a peritectic. The non-variant point was located at 2.0% Mn. (M24b; Mg, Mn)

555-M. (Russian.) **Structure of Liquid Metals.** I. V. Radchenko. *Uspekhi Fizicheskikh Nauk*, v. 61, no. 2, 1957, p. 249-276.

Experimental conditions for X-ray diffraction study of liquid metals, possible errors in obtaining X-ray photographs and their interpretation. Basic results of X-ray and neutron photograph investigations. Critical comparison of work on the structure of Hg, liquid metals with a dense packing of atoms in the solid state (Au, Pb, Ti, In, Cd, Al, Zn) and alkali liquid metals, (Ga, Bi, Ge, Sb, Se, Te, Sn). 101 ref. (M25, M22; 14-60)

556-M. (Russian.) **Investigation of the Copper-Cobalt System.** A. T. Grigor'ev, L. A. Panteleimonov, L. M. Viting and V. V. Kuprina. *Zhurnal Neorganicheskoi Khimii*, no. 5, 1956, p. 1064-1066.

Investigation by thermal analysis, microstructure and hardness measurement. Alloys were prepared from electrolytically manufactured materials by melting in alumina crucibles in an electric resistance furnace with Kryptol heater elements under a barium chloride cover, then held in vacuum at 1000° C. for 100 hr. and slowly cooled. No discontinuity in solubility in the molten state was revealed. Peritectical reaction beta + liquidus $\rightleftharpoons$ gamma takes place at 1112° C., the magnetic transformation at 1045° C. and the transformation beta→alpha at 305° C. (M24b, N12; Cu, Co)

557-M. (Russian.) **Phase Transformations in the Iron-Chromium-Vanadium System.** I. I. Kornilov and N. M. Matveeva. *Zhurnal Neorganicheskoi Khimii*, v. 2, no. 2, 1957, p. 355-366.

Investigated by differential thermal analyses, hardness measurement, specific electrical resistance, microstructure and X-ray analysis. The system was investigated along a section which ran through the compositions of the phase compounds Fe-Cr and Fe-V (50 at.% Fe), and along a ray section running from the Fe corner to the Fe-V side, at ratios Cr: V of 1:3, 1:1, and 3:1. (M24c; Fe, Cr, V)

558-M. (Russian.) **Phase Diagram of the Ternary System Ni-Cr-W.** I. I. Kornilov and P. B. Budberg. *Zhurnal Neorganicheskoi Khimii*, v. 2, no. 4, 1957, p. 860-867.

Part of the phase diagram up to 50% Cr and 30% W was studied. The alloys were melted in corundum

crucibles under a large layer of basic slag, and subjected to gradual homogenizing anneal at 1200, 1000 and 800° C. By thermal and microstructural analysis, two vertical sections of the system with 10 and 30% W were constructed, and the temperatures of the beginning of crystallization of the alloys of these sections were established.
(M24C; Ni, Cr, W)

570-M.* (German.) **Formation of Goss Structure in Iron-Silicon Alloys.** K. Detert. *Metall,* v. 12, Sept. 1958, p. 817-821.

Goss-structure sheet metal is important in the manufacture of transformers because of its magnetic properties. Alloys with 3% Si, 0.1% Mn, and sometimes 0.1% Ni, 0.1% Cu, first hot rolled to 3.4 mm. then cold rolled in several steps with intermediate annealing at about 800° C., were structure tested. Goss-structure favored by cold working is thought to be influenced by still unknown trace elements. 21 ref. (M27g, M26c, P16; SGA-n, Fe-b, *Si*)

571-M.* (German.) **"Stacking Faults" in Cold Deformed Metals With Face-Centered Cubic Lattices.** Ch. Wagner. *Metall,* v. 12, Sept. 1958, p. 824-829.

Lattice faults as a consequence of cold deformation detectable by X-ray interference lines. Polycrystalline materials tested by diffractometer and photographic methods. Increase in strength and rigidity after cold working thought to be a consequence of "stacking faults" in the lattice structure. 27 ref. (M26s, 3-68)

572-M.* (Japanese.) **Atomic Power and Metals; Radiation Damage.** E. Fujita. *Metals,* v. 28, Sept. 1958, p. 673-676.

Damage is caused by an atomic collision of neutron and an atom in a lattice point. A neutron of the order of MeV in a pile can damage severely, but thermal neutron can not. The particles which can do the damage are fast neutrons, fast protons and deuterons, fast alpha-particles, fast electrons, hard X-rays, nuclear fission products and accelerated ions, which should have energy of the order of MeV. Radiation damage consists of atomic displacement in lattice, formation of Frenkel lattice imperfection, formation of impurity and thermal spike and displacement spike (or recoil). (M26, P18, 2-67)

Methods study local structure and changes in metal microstructures, including use of electron microscope, X-ray analysis, microspectral method and autoradiography with particular emphasis on the latter. 35 ref. (M21, M22, M23, 1-59)

576-M. Some Data on the Phase Diagram of the Chromium-Columbium System. V. P. Elyutin and V. F. Funke. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 3, Mar. 1956, p. 68-76. (Henry Brutcher, Altadena, Calif., Translation no. 4304.)

Experimental preparation of specimens; determination of melting points; liquidus temperatures; three portions of the solidus. Phase composition and structure of alloys; results of micrographic analysis and microhardness measurements. Identification and composition of intermetallic compounds; eutectic transformations and points; boundaries of single-phase solid solutions; data on intersolubility of Cr and Cb. Approximate phase diagram (liquidus and solidus) of Cr-Cb system. (M24b; Cr, Cb)

577-M. (Chinese.) **Basic Factors Influencing the Original Structure of Hadfield Steel.** Chzhai Khun-cyun. *Tszise chzhitsao,* v. 5, no. 3, 1956, p. 5-9.

Grain size in Hadfield steel influences its ductility, impact resistance, wear retsistance and other properties. Grain size depends on Al content, bath temperature, hardening velocity, carbon content, gas content in liquid steel. Introduction of 0.1% Al, lowering the teeming temperature to 1300-1320° C., is recommended. (M27c, Q-general, D9r; AY, *Al,* AD-p35)

578-M.* (French.) **Influence of the Composition of Reagents, With or Without Traces of Copper, on Micrographic Etching of Refined Aluminum.** Gerard Wyon. *Comptes Rendus,* v. 247, July 28, 1958, p. 458-461.

Fluorated aqua regia solutions can, according to their composition, produce two types of etch patterns, either large geometric figures or very numerous microfigures. Addition of a few parts per million of Cu ions transforms a microfigure etchant into an etchant that produces geometric figures, but only when applied to Al of commercial purity. 8 ref. (M20q; Al)

579-M. (Russian.) **Electron Microscopy of 1Kh18N9T Steel After Various Forms of Heat Treatment.** E. I. Kvashina. *Metallovedenie i Obrabotka Metallov,* no. 5, 1957, p. 35-38.

Influence of hardening temperature and aging temperature and duration on microstructure of steel containing 0.11% C, 1.20% Mn, 0.42% Si, 17.9% Cr, 10.06% Ni, 0.50% Ti, 0.21% S and 0.02% P. When hardening temperature is raised from 1100 to 1300° C. the quantity of Ti carbides is reduced. When hardened at 1050-950° C., an acicular phase appears alongside the Ti carbides. The nature of the acicular phase has not been established. The sharp increase in impact strength when hardened at a temperature above 1050° C. is linked with the diffusion of this phase. (M27, 2-64; SS)

580-M.* **Structure Determined Properties of Evaporated Bismuth Films.** Carl E. Drumheller. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 27-33.

Infrared electrical and electron microscope studies on Bi films obtained by condensation on cellulose nitrate substrate. Films possessed single-layer polycrystalline structure; thickness resistance measurements and low-frequency current noise studies indicated that major contribution to film resistance was from grain boundaries. Grain boundaries fell into two distinct categories according to whether they divide crystallites with similar or unrelated orientations. (M26, M27; Bi, 14-68)

581-M.* (Japanese.) **Anomalous Characteristics of Finished Metal Surfaces.** M. Matsunaga. *Metals,* v. 28, Oct. 1958, p. 721-725.

Depending on the finishing method, metal surfaces have completely different characteristics from the interior. Methods of measurement are: (1) optical (microscope, polarization, reflection); (2) diffraction (X-ray); (3) electric (surface potential, resistance); (4) microhardness testing; (5) surface property (fluid resistance, friction); (6) chemical (corrosion); (7) electrochemical (electrode potential, electrolytic deposit). Anomalies are caused by smut and smear, adsorption, chemical changes, mechanical strain and lattice imperfections. (M27, M21, M22, S14)

582-M. **Modern Techniques in Electron Metallography.** R. I. Garrod and J. F. Nankivell. *Australian Institute of Metals, Journal,* v. 3, Aug. 1958. p. 183-202.

Preparation and use of replicas; advantages and limitations of reflection, emission and scanning microscopy. Methods recently developed for direct examination of thin foils. Techniques complementary to electron microscopy, such as electron microdiffraction and electron probe analysis. 123 ref. (M21e)

583-M. **Crystal Structure of Ni_2B and Co_2B.** Stig Rundqvist. *Acta Chemica Scandinavica,* v. 12, no. 4, 1958, p. 658-662.

Ni_2B and Co_2B are isostructural with cementite (FeC). A single-crystal structure determination of NiB has been made. Some properties of the cementite structure. 24 ref. (M26q, M21f; Co, Ni, *B,* 14-68)

584-M. (English.) **Metallic Alloys.** J. Friedel. *Nuovo Cimento, Supplemento,* v. 7, no. 2, 1958, p. 287-311.

Study of energy states, behavior of electrons and nuclei, effect of impurities for metallic alloys in general. 40 ref. (M25, M26p, 3-69)

585-M. Composition Versus Hot Strength Diagrams of Alloys of the Titanium - Vanadium - Columbium System. V. S. Vlasov and I. I. Kornilov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk*, no. 7, July 1958, p. 136-139. (Henry Brutcher, Altadena, Calif., Translation no. 4346.)

Study of hot strength of Ti-rich alloys in Ti-V-Cb system. Phases present. Preparation of alloys along three radial sections from Ti corner with V/Cb ratios of 3/1, 1/1 and 1/3, respectively.
(M24c, 2-61; Ti, V, Cb)

586-M. Hexagonal Ordered Phases in the System Titanium-Aluminum and Titanium-Indium. K. Anderko. *Zeitschrift für Metallkunde*, v. 48, no. 2, 1957, p. 57-58. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. NRC-C2474.)

Previously abstracted from original. See item 169-M, 1957.
(M24; Ti, Ag, In)

587-M. Cohesive Energy of Potassium. Sam Berman, Joseph Callaway and Roger D. Woods. Miami University, Dept. of Physics. *U. S. Office of Technical Services*, PB 124594, Nov. 1955, 8 p. (Available at Library of Congress, Washington, D. C.—Microfilm $1.80; Photostats $1.80.)

(M25; K)

588-M. Investigation on the Zone Theory of the Energy of Electrons in Metals. George B. Spence and Ernst Katz. Michigan University, Engineering Research Institute. *U. S. Office of Technical Services*, PB 125898, Aug. 1956, 122 p. (Available at Library of Congress, Washington, D. C.—Microfilm $6.30; Photostats $19.80.)

Theoretical investigation of certain general problems which occur in using the zone theory of the electron energy bands to determine the phase boundaries of those alloys agreeing with the Hume-Rothery electron concentration rules. (M25)

589-M. Cohesive Energy of Noble Metals. K. Kambe. Harvard University. *U. S. Office of Technical Services*, PB 126153, Apr. 1955, 12 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.40; Photostats $3.30.)

Cohesive energies calculated at the observed lattice spacings with the rigid ion-core assumption are 61.7 for Cu, 55.8 for Ag and 49.2 for Au in comparison with the experimental values of 81.2, 68.0 and 92.0 respectively. (M25; Cu, Ag, Au)

590-M. Problems Encountered in a Study of the Beryllium-Chromium System. George H. Schippereit. Polytechnic Institute of Brooklyn. *U. S. Office of Technical Services*, PB 127951, May 1948, 5 p. (Available at Library of Congress, Washington, D. C.—Microfilm $1.80; Photostats $1.80.)

591-M. Crystallographic Structure and Orientation of the Y′ Phase in Four Commercial Nickel-Base Alloys. J. A. Amy and W. C. Bigelow. Michigan University. *U. S. Office of Technical Services*, PB 131518, July 1957, 18 p. $.50.

Selected area electron diffraction patterns obtained from matrix precipitate particles isolated by the extraction-replica technique from aged specimens of four commercial Ni-base alloys, Inconel-X, Waspalloy, M-252 and Udimet, which contain Ti and Al as hardening agents. From these patterns the matrix particles have been conclusively identified as the gamma phase. The ordered or super-lattice struoture reported for this phase in simpler alloy systems occurs also in these complex alloys and the particles develop with a high degree of preferred crystallographic orientation relative to the matrix lattice. (M26c, M27d; Ni-b)

592-M. Intermediate Phases in the Iron-Tungsten and Cobalt-Tungsten Binary Systems. Edward C. Van Reuth. Air Research and Development Command. Wright Air Development Center. *U. S. Office of Technical Services*, PB 131627, Dec. 1957, 29 p. $.75.

Some 53 alloys examined in an attempt to verify the finding of sigma phases in Fe-W and Co-W alloy systems. Selected regions of both binary equilibrium diagrams were investigated metallographically and by X-ray diffraction. It was also found that some portions of the existing equilibrium diagrams should be changed.
(M24b; Fe, W, Co)

593-M.* (German.) **Isolating Grain Boundaries in Steel.** Hermann Schenck, Eugen Schmidtmann and Heinz Muller. *Archiv für das Eisenhüttenwesen*, v. 29, Aug. 1958, p. 479-484.

Nature of grain boundaries in iron alloys. The influence of decarburization annealing in hydrogen-steam mixtures (3-5% H_2O) upon the microscopic behavior of chemically separated components. The isolate is also investigated after removal of the base metal through chlorination or dissolving in iodide alcohol. 10 ref.
(M27f; ST)

594-M. Possible Use of Tritium in Radiographic Study of Hydrogen Distribution in Titanium and Zirconium. B. I. Bruk and G. I. Nikolaev. *Academy of Sciences of the USSR, Proceedings*, v. 116, no. 1-6, 1957, p. 825-828. (Translation by Consultants Bureau, Inc.)

Investigation of hydrogen distribution in Ti and Zr, forgings and welds by means of tritium autoradiography. 6 ref.
(M23q; Ti, Zr, EG-n43)

595-M. Strontium-Antimony System and the Heats of Formation of Compounds of Strontium and Antimony. S. A. Shchukarev, M. P. Morozova and Kan Kho-in. *Journal of General Chemistry of the USSR*, v. 27, no. 7, 1957, p. 1803-1805. (Translation by Consultants Bureau, Inc.)

The existence of the compounds $SrSb_3$, SrSb, Sr_2Sb_2 and Sr_2Sb is established in the Sr-Sb system. Enthalpies of formation found for SrSb, Sr_2Sb_2 and Sr_2Sb. 4 ref.
(M24b, P12q; Sr, Sb)

596-M.* Polishing Hard Metals Electrochemically. J. M. Dickinson. *Metal Progress*, v. 74, Oct. 1958, p. 142-144.

A new technique simplifies metallographic preparation of high-melting metals and their alloys. By simultaneous use of mechanical and electrolytic polishing, layers of worked metal are avoided and an exceptionally smooth surface is produced in a short time.
(M2Op; SGA-q)

597-M.* Better Metallographic Techniques—Polishing by Vibration. E. L. Long and R. J. Gray. *Metal Progress*, v. 74, Oct. 1958, p. 145-148.

A new technique makes it possible to polish up to 24 specimens at a time without attention by a metallographer. Surfaces are generally better than can be achieved by hand polishing. (M20p)

598-M.* Light-Figure Phenomena Revealed and Crystal Faces Developed by Chemical Etching in Copper and Alpha-Brass Crystals. Mikio Yamamoto and Jiro Watanabe. *Tohoku University, Science Reports of the Research Institutes*, v. 10, June 1958, p. 240-250.

Distinct {100}, {110} and {111} light figures were revealed in copper and alpha brass single crystals etched with 20% aqueous solution of ammonium persulphate and, in alloy crystals containing more than about 20% Zn, etched with aqua regia plus water (1:1). Crystal faces developed by etching very systematically in accordance with etching conditions and crystal composition. (M26, M20q; Cu, 14-61)

599-M.* X-Ray Study of Cold Worked Metal Single Crystals. Tomiya Sutoki and Koichi Nakajima. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 2, 1958, p. 77-84.

The change in reflected intensity of X-ray due to the deformation of metal single crystals of Al and Zn examined with microphotometer by using Cu-K_α radiation. In Al single crystals, a large change in the relative intensity of (111) reflections was observed with an increase of deformation, and almost saturated at a few percent elongation. The increasing rate of the relative intensity reflected from the active slip plane was larger than that from the latent slip planes. Similar results were obtained with Zn single crystals. 7 ref.
(M26, M22g; Al, Zn, 14-61)

600-M. Study of the Thorium-Uranium Alloy System. G. G. Bentle. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/706, 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Resistivity and lattice parameter data complete part of the Th-U phase diagram and confirm that U causes a slight decrease in phase transformation temperature of Th and that the solubility of U in Th is less than 1% at room temperature and increases to about 7% at 1270° C. 10 ref. (M24b; U, Th)

601-M. Metallographic Studies of Uranium. T. K. Bierlein and B. Mastel. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1855, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Conventional metallography, precharacterized surface metallography, and fractography used to study the nature and extent of reactor-induced microstructural changes in U. Difficulties in microstructural interpretation can be surmounted by studying relative effect of such parameters as temperature of irradiation, flux intensity, burnup by supplementary metallographic techniques. 18 ref.
(M21, M23; U, 14-70)

602-M.* (German.) **Metallographic Techniques for Different Materials.** Walter Strohfeld. *Industrieblatt,* v. 58, Oct. 1958, p. 442-446.

Summary of recent techniques; suggestions for improvement of metallographic grinding, polishing and etching. Consideration of materials; soft and hard metals, precious and nonprecious; time involved for different materials and methods; manual and mechanical procedures, combinations. Improved electrolytic polishing procedure, wet polishing and diamond polishing. Etching of rare metals; traditional etching agents and new ones. 27 ref.
(M20)

603-M.* (German.) **Surface Impression Films.** H. Mahl. *Metalloberflache,* v. 12, Oct. 1958, p. 296-301.

Surface impression films obtainable by oxidation, vapor deposition, a thin varnish coat and polymerization serve mainly for electron microscope surface tests. In a film of equal thickness at any point of the profile, the surface shape is seen under the electron microscope through the effect of inclined planes. A depression gives the same picture as an elevation. By vaporizing a heavy metal at an acute angle to the surface, a more plastic picture is obtainable. (To be continued.) (M20r, M21e)

604-M.* (Japanese.) **Structural Diagram of Acicular Cast Iron Containing Molybdenum and Copper.** Tohei Ototani, Masuteru Maruyama, Youichi Tokunaga and Mitsuo Hara. *Japan Foundrymen's Society, Journal,* v. 30, Aug. 1958, p. 603-608.

Molten pig iron containing Mo and Cu was cast in a sand mold with steps 10, 20, 30 and 40 mm. in diameter. The structural diagram for acicular cast iron having a Brinell hardness of 240 to 280 was determined by metallographic observation, thermal analysis and hardness measurements. Matrix structure depended upon the cooling rate within the temperature range of austenite and the amount of alloying elements. 10 ref.
(M27, N12, Q29n, 2-60; CI, *Cu,* Mo)

605-M.* (Russian.) **Nature of Etching Figures of Aluminum-Copper (4% Cu).** N. N. Byinov and R. R. Zakharova. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 289-292.

In aging of Al-Cu (4% Cu) at 150° C. there is a connection between the hardening of the alloy and the dimensions and form of the etched figure. The etching figures, while they retain the correct form, are related to helical dislocation. Calculation was made of disorientation of mosaic blocks and the thickness of dislocation. By strengthening the alloy through aging, thickness of dislocation increases. 9 ref. (M26f, N7a; Al, *Cu*)

606-M. Stacking Faults in Close Packed Metallic Lattices. Pt. 1. The Nature and Origin of Stacking Faults. T. R. Anantharaman. *Current Science,* v. 27, July 1958, p. 238-241.

TRANSFORMATIONS and RESULTING STRUCTURES

1-N. Diffusion of Uranium Through Graphite. L. D. Loch, J. R. Gambino and W. H. Duckworth. *First Nuclear Engineering and Science Congress,* v. 1, 1957, p. 145-150.

Diffusion rates were determined in the range 3000 to 4350° F. The diffusion couples consisted of sintered UC_2 disks in contact with graphite rods. Two distinct types of uranium transport could be associated with volume diffusion and with migration along pores. 4 ref. (N1, 2-62; U, NM-k36)

2-N. Effect of Hydrogen Upon Martensite Formation in Low-Alloy Steels. R. Kumar and A. G. Quarrell. *Iron and Steel Institute, Journal,* v. 187, Nov. 1957, p. 195-204.

Metallographic method chosen was the quench-temper technique followed by quantitative evaluation of martensite formed in the quench by the point-counting technique of Howard and Cohen. 17 ref. (N8p, 2-60; AY, *H*)

3-N. Martensitic Reaction for Uranium. A. L. Bement and W. P. Wallace. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-51084 Rev., June 25, 1957, 26 p.

Isothermal studies on heat treatment and microstructure of uranium. 10 ref. (N6q; U)

4-N. Precipitation Hardening and Embrittlement of High-Strength Titanium Alloys. A. J. Griest, J. R. Doig, P. D. Frost and C. M. Schwartz. Wright Air Development Center Technical Report 54-355, Pt. 3. *U. S. Office of Technical Services,* PB 121890, Nov. 1956, 90 p. (CMA)

Age-hardening behavior of a series of alpha-beta alloys of the systems Ti-Mn, Ti-Mn-Al, Ti-V, Ti-V-Al and Ti-Fe, using hardness, tensile and X-ray diffraction data. Effects of solution temperature, aging temperature and alloy composition on the aging reaction. (N7a, Q26s; Ti)

5-N. (German.) **Eutectic Crystallization Structure.** E. Scheil and R. Zimmermann. *Zeitschrift für Metallkunde,* v. 48, Sept. 1957, p. 509-516.

Three kinds of eutectic crystallization described. Occurrence of a normal eutectic structure investigated statistically with consideration of the dependence on the volume ratio of the constituents. Degeneration in the system aluminum-Al_2Cu investigated. 14 ref. (N12q; Al)

6-N. (Italian.) **X-Ray Diffraction Determination of Recrystallization Curves in Al-Mg Industrial Alloys Containing From 1.5 and 5% Mg.** M. Paganelli. *Alluminio,* v. 26, Sept. 1957, p. 353-360.

Temperatures at beginning and end of recrystallization cycle determined for four alloys subjected to varying degrees of cold working, then annealed 1 hr. and given rapid water quench. Given same degree of cold working, initial and final recrystallization temperatures decrease as Mg content increases. 6 ref. (N5, M22g; Al, *Mg*)

7-N. (Russian.) **Pearlitic Transformations in Chromium Steels Containing Columbium and Zirconium.** D. Ya. Vishnyakov and L. S. Ol'Khova. *Metallovedenie i Obrabotka Metallov,* Sept. 1957, p. 18-21. (CMA)

Observations of isothermal transformations of undercooled austenite. In samples undercooled below the upper bend of the time-temperature curve, pearlite precipitates in needles and not in its usual form. In the

part of the diagram corresponding to the upper intermediate stage of the transformation there is a supplementary curve indicating the formation of needle-like pearlite from excess austenite that did not take part in the previous transformation into needle-like troostite. 2 ref. (N8h; AY, *Cr, Cb, Zr*)

8-N. (Czech.) **Influence of Silicon and Chromium on the Position and the Range of Eutectoid Temperatures.** Stanislav Drapal. *Hutnické Listy,* v. 12, Sept. 1957, p. 769-777.

Studies on spheriodal graphite cast iron show that the formation of austenite starts with preference in middle domains of the dendrites. 10 ref. (N8; Si, Cr) (N8f, 2-60; CI-r, *Si, Cr*)

9-N. (Czech.) **Isothermal Austenite Decomposition in Tungsten Alloy Steels. Pt. 3.** Josef Cadek and Karel Mazanec. *Hutnické Listy,* v. 12, Sept. 1957, p. 777-788.

Effect of tungsten in steel containing 0.4% carbon; formation of eutectoid containing the carbide M_6C (steels with 4.3 and 9.0% W, respectively) is accompanied by increasing carbon concentration in the untransformed austenite. 24 ref. (N8g; AY, *W*)

10-N. (Czech.) **Morphology of Lamellar Pearlite in Steel Containing 2.8% Copper.** Ivan Hrivnak. *Hutnické Listy,* v. 12, Sept. 1957, p. 801-803.

Precipitation of a Cu-rich phase in steel containing 0.1% C and 2.8% Cu occurs on the boundaries of ferritic grains as a fine dispersion. 3 ref. (N8h; AY, *Cu*)

11-N. (German.) **Structure of Alloy Electrodeposits. Pt. 12. Copper-Tin Alloys.** E. Raub and F. Sautter. *Metalloberfläche,* v. 11, Aug. 1957, p. 249-252.

High-copper bronze deposits are mostly of the face-centered solid solution type, the solubility limit of which is about 10 times higher than the equilibrium. The speculum deposits consist of the delta and eta-phase of the system copper-tin, and can be transformed into the stable epsilon phase by annealing. 7 ref. (N12d, L17; Cu, Sn)

12-N. (Russian.) **Growth of Large Zinc Crystals With a Predetermined Orientation.** B. N. Bushmanov. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 310-314.

Obtaining large Zn monocrystals. Orientation of crystallographic axis can be predetermined by insertion (in the melt) of a monocrystalline Zn rod, cooled at the opposite end. 12 ref. (N12s, M26; Zn, 14-61)

13-N. (Russian.) **Volumetric Change of Carbide Phase on Tempering of Steel.** N. N. Lyulicheva. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 319-330.

Investigation on steels of a heterogeneous structure, applying methods of space metallography and using optical and electron microscopes. Hypothesis of the carbide phase structure at low tempering temperatures. 14 ref. (N8a, P10d; ST)

14-N. (Russian.) **Texture of Recrystallization of Cold Rolled, Low-Carbon Steel.** K. V. Grigorov and G. P. Blokhin. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 331-338.

Development of recrystallization structure on cold rolling and deformation. Explanation of the relationship by means of model representation of the recrystallization mechanism. 15 ref. (N5, CN)

15-N. (Russian.) **Influence of Intermediate Annealing Upon Texture of Cold Rolling and Recrystallization.** K. V. Grigorov and G. P. Blokhin. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 339-343.

Experimental data on transformer and low-carbon steels applying magnetometric method of measurement. 13 ref. (N5, M26c; CN)

16-N. (Russian.) **Distribution of Carbon on Transformation of Austenite in the Intermediate Zone.** L. I. Kogan and R. I. Entin. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 360-368.

Investigation in respect to composition, temperature and time. 17 ref. (N8; ST)

17-N. (Russian.) **Effect of Deformation Under Low Temperature on Phase Transformations and Properties of 1X18N9T Austenitic Steels.** A. P. Gulyaev and I. V. Chernenko. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 2-7.

Transformation of austenite to martensite in strained samples at temperatures of 100 to −196°. Previously they had been quenched at 1050° in water and stabilized at 800° for 100 hr. (N8p; SS)

18-N. (Russian.) **Strain Hardening of Austenite by Reverse Martensite Transformation.** V. N. Gridnev, V. T. Cherepin and N. F. Chernenko. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 7-12.

Effect of direct and reverse martensitic transformation on mechanical properties of austenite; effect of speed of heating on kinetics of transformation and stabilization of austenite. The maximum effect of stabilization takes place after the first cycle of heat treatment. 5 ref. (N8p. Q general; ST)

19-N. (Russian.) **Some Rules Governing the Direct and Reverse Martensite Transformation.** E. L. Vinogradskaya and G. A. Kreslina. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 12-15.

The iron-base alloy studied had the following composition: 0.06% C, 13.2% Mn, 0.28% Cu, and 2.12% Co. Transformations were observed by magnetometric methods. Results were related to the change in the quantity of alpha-phase in the samples. (N8p; AY)

20-N. (Russian.) **Cold Hardening, Recrystallization and Softening of Alloyed Austenite.** L. A. Metashop and M. E. Blanter. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 15-23.

The independence of the precipitation processes is shown; dissolving of the carbide and preliminary softening of the cold hardening alloyed austenite by heating. 14 ref. (N8; AY)

21-N. (Russian.) **Effect of Preliminary Hardening on the Rate of Diffusion of Carbon in Austenite.** M. A. Krishtal. *Metallovedeni i Obrabotka Metallov,* no. 8, Aug. 1957, p. 20-21.

The hardening of steel is associated with the formation of microvoids in the formerly solid metallic matrix. These develop in consequence of the tensions associated with the martensite transformation. 5 ref. (N8p, J general; ST)

22-N. (Russian.) **Effect of the Rapidity of Crystallization on the Micro-Heterogeneity of Magnesium Alloys.** Z. A. Sviderskaya, M. E. Drits and E. C. Kadaner. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 23-29.

Many physical and mechanical properties of alloys depend on changes in the structural heterogeneity of the alloy. Heat resistance is one of important factors. Rapid, or very slow cooling, even distribution of structural components ease the process of diffusion, and to a certain degree, lower heat resistance. 12 ref. (N12; Mg)

23-N. (Russian.) **Influence of Additions to Aluminum on the Speed of Reactive Diffusion.** D. I. Lainer and A. Ya. Potemkin. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 33-35.

In the production of Al-clad Ni strip, the products of reactive diffusion exert great influence on the quality of the finished products. (N1, L22; Ni, *Al*)

24-N. (Russian.) **Nature of Martensite Transformation.** M. E. Blanter and P. V. Novichkov. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 11-14.

4 ref. (N8p; ST)

25-N.* **Microstructure and Mechanical Properties of Ti-Cu-Al and Ti-Cu-Al-Sn Alloys.** R. F. Bunshah and H. Margolin. *American Society for Metals, Transactions,* v. 51, Preprint no. 58, 1957, 22 p. (CMA)

TTT-diagrams and the mechanical properties were studied for active eutectoid Ti-base alloys. Ti-8Cu-3Al-2Sn and Ti-5Cu-3Al-2Sn had the best combination of properties when forged in the $\alpha + \beta$ field and annealed in the $\alpha + Ti_2Cu$ field at 750° C. for 24 hr. The reaction $\beta \rightarrow \alpha + Ti_2Cu$ occurs quickly and a stable structure is obtained. Good strength-ductility combinations are also possible with Ti-5Cu-3Al and Ti-8Cu-3Al. Ductility is benefited by the 2% Sn and by primary α, and harmed by ω-phase or long continuous compound paths. 9 ref. (N9, M27, Q23p, Q27a; Ti)

26-N.* **Response of an Iron-Base Alloy, Hardened With Titanium, to Various Aging Times and Temperatures.** T. W. Eichekberger. *American Society for Metals, Transactions,* v. 51, Preprint no. 60, 1957, 27 p. (CMA)

The effect of adding Ti, Mo, and V on the age hardening of commercial Ni-Cr-Fe alloy was studied in the 1100-1600° F. range for periods extending from 1-512 hr. Neither V nor Ti (below 1.3%) produce much effect. Mo above 2.25% produces hardening above 1400° F. Grain boundaries and twin lines become more definite with increases of aging temperature and time, due to heavy precipitation and within grains of 3.25% Mo specimens be-

come more apparent as the temperature increases beyond 1200° F. Other specimens not containing Mo show a different general precipitation. 4 ref.
(N7a, 2-60; Ni, Cr, Fe, *Ti, Mo, V*)

27-N.* Temperature and Rate Dependence of Strain Hardening in the Aluminum Alloy 2024-0. D. S. Fields, Jr., and W. A. Backofen. *American Society for Metals, Transactions,* v. 51, Preprint no. 61, 1957, 31 p.

Strain hardening characteristics of the Al alloy 2024-0 have been studied over a range of constant shear-strain rates and temperatures. Generally high rates of strain hardening are found at the low temperatures. Little or no strain hardening occurs at the higher temperatures. At intermediate temperatures, the shape of the stress-strain curve is strongly dependent upon strain rate. 17 ref. (N7e, 2-61, 3-67; Al)

28-N.* Magnetic Analysis of Phase Changes Produced in Tempering a High-Carbon Steel. Morris Mentser. *American Society of Metals, Transactions,* v. 51, Preprint no. 66, 1957, 36 p.

Hexagonal close-packed iron carbide was identified magnetically by a direct determination of its characteristic point of inflection at approximately 380° C. Present study showed that hexagonal carbide forms initially upon decomposition of retained austenite in the second stage of tempering, at 230° C. or lower. 28 ref. (N8a, M23a; CN-r)

29-N.* Effect of Silicon, Manganese and Iron on the Aging Characteristics of Aluminium-Copper Alloys Containing 3.0 and 4.5% Copper. A. Chitty. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 65-76.

Hardness vs. aging-time curves at 21.5, 130 and 190° C. for high-purity Al-base alloys containing 3.0 and 4.5% Cu, with separate additions of up to 2.0% Si and Mn, and up to 2.0% Fe. 23 ref.
(N7a, 2-60; Al, *Cu, Si, Mn, Fe*)

30-N.* Hardness Reversion of Dilute Aluminium-Copper and Aluminium-Copper-Magnesium Alloys. R. H. Beton and E. C. Rollason. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 77-85.

Reversion investigated in naturally aged Al-Cu-Mg alloys with Cu:Mg weight ratios of 7:1 and 2.2:1, and in both naturally and artificially aged Al-Cu alloys. 17 ref.
(N7a; Al, *Cu, Mg*)

31-N.* Hardness Reversion of Aluminium-Silver Alloys. R. H. Beton and E. C. Rollason. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 85-89.

Effect of heating "cold" age hardened Al-Ag alloys examined by means of hardness measurements. Reversion of hardness takes place in two distinct stages at different temperature levels. 16 ref.
(N7a; Al, *Ag*)

32-N.* Grain Growth in Metals With Special Reference to High-Purity Nickel. Paul Feltham. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 95-97.

Grain growth in 99.99% Ni studied in the range 700-900° C. A statistical theory for the most probable initial and instantaneous grain diameters. The validity of the theoretically desired grain growth law is investigated experimentally. 9 ref. (N3; Ni-a)

33-N.* An Investigation Into Some Aging Characteristics of Lead-Antimony Alloys, With Particular Reference to the Effect of Strain. E. J. Hooker. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 98-107.

Lead alloys containing up to 0.88% antimony were strained by amounts up to 10% after solution treatment, and the progress of aging at room temperature, 100° C. and 150° C. was determined by hardness measurements. Initial and final structures examined metallographically. 29 ref. (N7a, 3-68; Pb, *Sb*)

34-N.* Aging Characteristics of Ternary Aluminium-Zinc-Magnesium Alloys. I. J. Polmear. *Institute of Metals, Journal,* v. 86, Nov. 1957, p. 113-121.

A systematic study of a wide range of ternary Al-Zn-Mg alloys with basic Zn contents of 4, 6, and 8% and Mg contents within the range 0-3%. Hardness vs. aging-time curves were determined at regular intervals between −20 and +240° C., tests being carried out for periods of up to two years. Small quantities of Mg have a pronounced effect on the age-hardening capacity of Al-Zn alloys. 36 ref.
(N7a; Al, *Zn, Mg*)

35-N.* Recrystallization Process in Tungsten as Influenced by Impurities.

R. A. Swalin and A. H. Geisler. *Institute of Metals, Journal,* v. 86, Nov. 1957, p. 129-134.

Role of special impurity additions in W investigated by electron microscope and neutron diffraction techniques. Certain types of impurity raise the recrystallization temperature of W several hundred degrees and also possibly reduce the nucleation rate of primary grains drastically, thus allowing the entire wire to be occupied by a few large grains. High-temperature annealing results in discontinuous grain growth, with the development of a sharp (320) texture. 8 ref. (N5, 3-69; W)

36-N.* Variations of Transformation Characteristics Within Samples of an Alloy Steel. W. Steven and D. R. Thorneycroft. *Iron and Steel Institute, Journal,* v. 187, Sept. 1957, p. 15-32.

Variations in isothermal transformation characteristics existing within unforged alloy steel ingot samples and in bars and wires produced from the same ingot. Differences between transformation characteristics due to variations in intensity of microsegregation of alloying elements within the samples. 11 ref. (N8g; AY, 5-59, 4-55, 9-69)

37-N.* Diffusion Phenomena in Pressure Welding. A. G. Guy and A. L. Eiss. *Welding Journal,* v. 36, Nov. 1957, p. 473s-480s.

Width, straightness and parallelism of weld interfaces in pressure welded copper-brass specimens studied to determine diffusion processes that occur during subsequent heating and to obtain information on the transport of Zn along the weld interface. 10 ref. (N1h, K5; Cu-n)

38-N. (Czech.) **Thermodynamic Considerations on the Effect of Additions on Cast Iron Graphitization.** Stanislav Drapal. *Hutnické Listy,* v. 12, 1957, p. 683-687.

Effect of addition elements on stability of complex cementite; free combination energy used as stability criterion. Calculated that Cr and Mn would increase stability while Co and Ni would increase instability of complex cementite. 17 ref. (N8s, P12, 2-60; CI)

39-N. (Czech.) **Eutectoid Reaction. Pt. 2. Eutectoid and Pearlite Reaction in Alloy Steels.** Josef Cadek. *Hutnické Listy,* v. 12, 1957, p. 687-695.

Critical analysis of published literature on the mechanism of effects of alloying elements upon eutectoid reaction in steels. Importance of gathering data upon effects of alloying on kinetic parameters, on surface energy, on the boundary of gamma grains as well as energy of phase boundaries, carbide-austenite, ferrite-austenite and carbide-ferrite. 64 ref. (N8h; AY)

40-N. (French.) **Introduction of the Study of Diffusion.** A. D. Le Claire. Paper from "Diffusion in Metals". Bibliotheque Technique Philips, p. 1-17.

Thermodynamic point of view; Fick law and Darken equation, use of chemical potential; crystallographic point of view; influence of composition on the diffusion coefficient; the case of alloys with several components; the mechanism of diffusion of voids; experimental measurement of diffusion coefficients. 21 ref. (N1)

41-N. (French.) **Diffusion of Radiotracers in Solids.** K. Compaan and Y. Haven. Paper from "Diffusion in Metals". Bibliotheque Techniques Philips, p. 19-22.

Method using electric analogy for calculating diffusion coefficients from physical data. The equation giving the relation between diffusion and ionic conductivity is demonstrated. 2 ref. (N1b; 14-63)

42-N. (French.) **Relation Between Diffusion Through Grain Boundaries and Their Structure.** P. Lacombe. Paper from "Diffusion in Metals". Bibliotheque Technique Philips, p. 23-52.

Diffusion as a means of studying the structure of grain boundaries. Experimental methods are emphasized; importance of diffusion through grain boundaries proved directly by autoradiography. 33 ref. (N1, M27f)

The preliminary annealing temperature of cold rolled Al-Ti, Al-Ti-Cu and Al-Mg-Ti alloys studied for effect of varying the Ti content; microscopy and hardness testing were used. (N5, T23; Al, Ti, *Cu, Mg*)

52-N. (Japanese.) **Study of Grain Size in Aluminum Sheets.** Takashi Ikeno. *Light Metals,* v. 7, July 1957, p. 28-44.

Effect of annealing conditions and composition on recrystallized grain growth; effects of working strain and gas content on grain growth. 13 ref. (N3, N5; 2-60, 2-64, 4-53; Al)

53-N. (Book-French.) **Diffusion in Metals.** A Symposium. 124 p. 1957. Bibliotheque Technique Philips, Eindhoven, Holland. $5.25.

General introduction; influence of structural defects and grain boundaries on diffusion; theoretical importance of the Kirkendall effect and electrolytic transport; diffusion of atoms and particularly of inert gas; influence of elastic stress on diffusion. Papers abstracted separately. (N1)

54-N.* **Structural Change and Recrystallization of Hydrogen-Hardened Palladium.** Takesi Sugeno and Hideaki Kawabe. *Institute of Scientific and Industrial Research, Osaka University Memoirs,* v. 14, 1957, p. 25-35.

When Pd adsorbs hydrogen electrolytically, two face-centered-cubic phases, alpha and beta, are formed depending upon the concentration of hydrogen. The hardness of Pd increases with hydrogen concentrations in alpha phase and is constant in the beta phase. When hydrogen is discharged either thermally or

anodically, the alpha phase Pd resumes the hardness of the annealed state, whereas beta phase Pd is still in the hardened status. Microscopically, beta phase Pd has many parallel line markings, and crystallographically, these line markings are in good agreement with intersections of (111) planes and the surface plane. The hydrogen-hardened beta phase Pd recrystallizes by annealing at about 600° C. This recrystallization is not caused by ordinary nucleations and growth mechanism, which is generally found in annealing of the cold worked metals. 5 ref. (N5; Pd, *H*)

55-N.* Interstitial Diffusion of Copper in PbS Single Crystals. J. Bloem and F. A. Kröger. *Philips Research Reports,* v. 12, Aug. 1957, p. 281-302.

At temperatures $100 < T < 500°$ C., Cu can diffuse rapidly into PbS via interstitial sites. Existing cation vacancies are filled by Cu, while Cu may also be bound by S at internal surfaces (cracks, dislocations). In the presence of S in the atmospheres (H_2S), Cu does not enter the crystal; interstitial Cu already present in the crystal may be drawn out when the crystal is heated in such an atmosphere. The effect is attributed to a lowering of the thermodynamic potential of Cu by the formation of Cu_2S or CuS. 18 ref.
(N1; Cu, Pb, 14-61)

56-N.* Interstitial Diffusion of Nickel in PbS Single Crystals. J. Bloem and F. A. Kröger. *Philips Research Reports,* v. 12, Aug. 1957, p. 303-308.

Under reducing conditions, Ni may penetrate into PbS crystals at temperatures $T < 500°$ C. at which the self-diffusion in PbS is negligible; it diminishes p-type conductivity and may cause n-type conductivity with donors of a depth $E \approx 0.03$ ev. The diffusion probably takes place via the interlattice with a diffusion constant $DNi = 17.8 \exp(-22000/RT)$ cm^2 sec^{-1}. Under sulphurizing conditions (H_2S) the Ni can be drawn out of the crystal again and the original conductivity restored.

Comparison of T-T-T curves for four classes of steel; structures for service conditions; hardness range; maximum wear resistance. (To be continued.) (N8g; TS)

63-N.* Production of Ferrite in Spheroidal Graphite Cast Iron by Heat Treatment. John Gittus. *Iron and Steel,* v. 30, Dec. 1957, p. 639-641.

Ferrite is produced by the graphitization of the carbide constituent of the pearlite, a process which is retarded by the presence of minor amounts of Sn and Cu, Bi, Pb, Cr, Mn and In. (N8s, 2-60; CI-r)

64-N.* Mechanism of Formation of Banded Structures. Paul G. Bastien. *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 281-291.

The banded structure in steel is produced by chemical heterogeneity due to dendritic or small-scale segregation during the cooling of the ingot. Each element which in solid solution produces a displacement of the temperature of the upper transformation point A_3 of the steel, accompanied in some cases by a horizontal displacement of the transformation curve can give rise to a banded structure. 42 ref.
(N12; ST, 5-59)

65-N.* Low-Carbon Bainitic Steels. K. J. Irvine and F. B. Pickering. *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 292-309.

The main feature of these steels is that the normal polygonal ferrite formation is retarded so that transformation to bainitic ferrite can occur over a wide range of cooling rates. This is achieved most effectively with a ½% Mo-B base composition. The tensile strength of the steel depends to a large extent on the temperature of transformation, which is controlled by an additional alloy element. With additions of alloying elements up to about 3% it is possible to reduce the transformation temperature from 650 to 450° C. and at the same time to increase the tensile strength from 40 to 80 tons per sq. in. 15 ref. (N8m, 2-60; AY)

66-N.* Tempering of Low-Alloy Creep-Resistant Steels Containing Chromium, Molybdenum and Vanadium. E. Smith and J. Nutting. *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 314-329.

Hardness changes which occur during the tempering of a range of quenched 0.2% C steels containing up to 3% Cr, 1% V and 1% Mo have been measured. The accompanying microstructural changes were determined by preparing extraction replicas for the electron microscope; the precipitated carbides were identified by transmission electron diffraction and selected-area electron diffraction. 27 ref. (N8a, Q29n, M21e; AY, *Cr, Mo, V*)

67-N.* Recrystallized Surfaces of Aluminum Extrusions. Guy V. Bennett. *Metal Progress,* v. 72, Dec. 1957, p. 102-104.

"Cold" work at surfaces of extruded bar may nucleate recrystallization of deep surface layers, producing a layer of metal of low strength and endurance. (N5, Q general; Al, 4-58)

Examination of Fe-Ni and Fe-Ni-Co alloys. 6 ref.
(N8p, M23; Co, Fe, Ni)

83-N.* **Effects of Aging and Straining on the Internal Friction of Hydrogen Charged 1020 Steel at Low Temperatures.** L. C. Weiner and M. Gensamer. *Acta Metallurgica,* v. 5, Dec. 1957, p. 692-694.

Aging at room temperature or previous straining of hydrogen-charged 1020 steel causes an internal friction peak at 105° K. to appear, reach a maximum, decrease and finally disappear. This peak has been explained by a model which involves the dragging along of hydrogen atmospheres by oscillating dislocations. Another peak at 50° K. has been observed which is apparently due to stress-induced diffusion of interstitial hydrogen. 10 ref.
(N7e, Q22; CN, *H*)

84-N.* **Recrystallization During Creep of Prestrained Aluminum.** J. H. Auld, R. I. Garrod and T. R. Thomson. *Acta Metallurgica,* v. 5, Dec. 1957, p. 741-746.

Dependence of recrystallization time on the applied stress during creep of both lightly and heavily prestrained Al. The time for the onset of recrystallization increases progressively with increasing creep stress. Some suggestions, based on the structural changes produced during creep, are advanced to account for the manner in which this incubation time varies with applied stress and degree of prior deformation. 18 ref. (N5, Q3; Al)

85-N. **High Strength Without Heat Treatment.** *Design Engineering,* v. 3, Dec. 1957, p. 37-40.

Frontier 40-E, an aluminum alloy with Zn, Mg, Cr and Ti, attains properties of great strength, light

weight, shock resistance on aging at room temperature or on adjacent aging at low temperatures. (N7a, Q general; Al, *Cr, Mg, Ti, Zn*)

86-N.* Carbide Precipitation in Several Steels Containing Chromium and Vanadium. Arun K. Seal and R. W. K. Honeycombe. *Iron and Steel Institute, Journal,* v. 188, Jan. 1958, p. 9-15.

Tempering of several steels with the basic composition 0.2% C, 9% Cr studied using electron microscopic, X-ray and electron diffraction methods. The maintenance of hardness in the range 250-400° C. is shown to result from the stability of the fine cementite precipitate, a consequence of the high Cr content of the steels. Examination of extraction replicas in the electron microscope shows that between 400 and 550° C. the cementite redissolves in the ferrite and CrC is separately nucleated initially as a very fine precipitate (< 50 Å). 15 ref. (N7; AY, *Cr, V*)

87-N.* Transformation Kinetics and Mechanical Properties of Zr-Mo Alloys. R. F. Domagala, D. W. Levinson and D. J. McPherson. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1191-1196. (CMA)

TTT-curves were established for sponge-base Zr alloys with 1.3, 3.3, 5.4 and 7.5% Mo. The noses at 600-650° C. are moved to longer times with increasing Mo content. Resistivity measurements were the basis of the study. Tensile and impact test bars were obtained both as isothermally quenched and as quenched and reheated. The 1.3% Mo alloy showed the best mechanical properties. Others showed a brittle behavior regardless of heat treatment. The formation of omega-phase is implicated in this behavior. 9 ref. (N6n, Q general; Zr, *Mo*)

88-N.* Phase Transformation in Hypoeutectoid Ti-Cr Alloys. H. I. Aaronson, W. B. Triplett and G. M. Andes. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1227-1235. (CMA)

The proeutectoid alpha and eutectoid reaction of Ti-7.22Cr were studied in the 550-725° C. range. The ubiquitous grain boundary allotriomorphs are never the dominant morphology at late reaction times, as are Widmanstaetten dideplates above 675° C. (crystals are often degenerate). Below 650° C. intragranular plates are the dominant morphology. $TiCr_2$ crystals nucleate at alpha-beta boundaries at alpha allotriomorphs and plates, are engulfed by the growth of alpha and then nucleate at interphase boundaries, resulting in the further growth of alpha crystals. 15 ref. (N9; Ti, Cr)

89-N.* Formation of Intermetallic Layers in Diffusion Couples. L. S. Castleman and L. L. Seigle. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1173-1174.

Note on existence of delta and epsilon phases in Al-Ni system as indicated by presence of intermediate layer formation with diffusion couples. Need for caution in applying diffusion couple technique to systems in which low-melting components are formed in conjunction with high-melting components. (N1e; Al, Ni)

90-N.* Some Characteristics of the Martensite Transformation of Cu-Al-Ni Alloys. C. W. Chen. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1202-1203.

Transformation of phase beta sub 1 in Cu alloy containing 14.5% Al and 0.5 to 3.0% Ni studied metallographically with the aid of motion pictures. Gamma prime transformation began at 10° C. Reproducibility of martensite transformation. Effect of strain on transformation behavior. 8 ref. (N6q; Cu, *Al, Ni*)

91-N.* Approximate Method for Calculations Using Concentration-Dependent Diffusion Coefficients. A. G. Guy, M. Golomb and A. S. Yue. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1204-1206.

Approximate method permits a correction to be made for variation of diffusion coefficient with concentration using equations that apply for constant diffusion coefficient value. Method illustrated by use of Cu-Zn system for which time to reach steady state conditions was estimated within 20%. Also allows development of concentration distribution curves describing diffusion into semi-infinite solid with comparable accuracy to actual variation of diffusion coefficient with concentration. 6 ref. (N1b)

92-N.* Diffusion of the Elements of the 1B and 11B Subgroups in Silver. A. Sawatzky and F. E. Jaumot, Jr. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1207-1210.

Data on diffusion of Cu and Hg in single crystals of Ag. Present and previous data indicate activation energies for diffusion of atoms of a given subgroup into the same solvent or similar, but frequency factors differ. Atomic size does not affect activation energy provided solid solutions are formed. 10 ref. (N1, P13a; Ag, 14-61, *Cu, Hg*)

93-N.* Mechanism of Precipitation in a Cu-2.5% Fe Alloy. J. B. Newkirk. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1214-1220.

Precipitation process in a Cu alloy containing 2.5% Fe studied experimentally by X-ray diffraction, hardness measurements, light and electron observations. Gamma Fe and alpha Fe precipitate simultaneously, with gamma Fe dominating in the early stages. During later stages the particles of gamma Fe dissolve providing the Cu lattice with Fe atoms which diffuse to the more stable alpha Fe particles. 20 ref. (N7b; Cu, *Fe*)

94-N. Nature of the Ni-Cr System. Robin O. Williams. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1257-1260.

Nickel-chromium alloys containing between 16 and 60% Ni were examined by X-ray diffraction and metallographic techniques for the purpose of determining nature of aging in terminal solid solutions and the nature of the phase diagram. Information was obtained on terminal solid solubilities in Ni and Cr systems. Rate and mode of precipitation during cooling. 8 ref. (N7, M24b, Ni, Cr)

95-N.* Growth of Iron Alloy Single Crystals From the Melt. R. C. Hall. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1267-1268.

Apparatus for growing single crystals of Al-Fe alloys above 1% Al, and Si-Fe alloys above 3% Si. Consists of pointed crucible with molten metal charge which is slowly lowered through heated zone into cooler zone. Single crystal nucleates at bottom and grows through charge. 5 ref. (N3r, 1-53; *Al, Si,* Fe)

96-N. Some Internal Friction Studies in Columbium. R. W. Powers and Margaret V. Doyle. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1285-1288.

Diffusion of carbon in columbium investigated by internal friction measurements. At 1 cycle per sec. the damping peak arising from stress-induced ordering of C in Cb was found at 268° C. while the nitrogen peak was at 285° C. Activation energy and diffusion coefficients were calculated for C and N in Cb. 19 ref. (N1, Q22; Cb, *C, N*)

98-N.* (English.) Study on the Diffusion of Carbon in Gamma Iron by Internal Friction Method. Ke T'ing-sui and Yang Pen-wei. *Scientia Sinica,* v. 6, Aug. 1957, p. 623-632.

In gamma-iron (containing 1.7% Mn), an internal friction peak was observed around 240° C. with a frequency of vibration of about 2 cycles per sec. The height of the peak increased with an increase of the carbon content and decreased when the specimen was annealed at an elevated temperature. The activation energy associated with this peak was found to be 34,000 ± 2000 cal. per mol which is close to the activation energy of diffusion of carbon in gamma-iron determined in macrodiffusion experiments. It is concluded that the observed internal friction peak is associated with the stress-induced diffusion of carbon in gamma-iron. 11 ref. (N1e, Q22, P13a; Fe, *C*)

99-N* (Dutch.) Crystalline Structure in the Recrystallization of Metals. W. G. Burgers and T. J. Tiedema. *Metalen,* v. 12, Nov. 30, 1957, p. 458-464.

Grain boundary has a "structure" dependent on the mutual orientation relationship of the continuous grains. The influence of the orientation relationship between two adjacent grains on the grain boundary energy is illustrated by the equilibrium positions of the boundaries when heating a specimen of three crystals with pre-chosen orientation. Large grain growth at the expense of surrounding smaller grains, inclusion in a metal crystal and a possible nucleation process involving the polygonization of local curvatures present in the original deformed matrix are explained with a grain boundary dislocation model. 12 ref. Under the assumption that carbon has a definite influence on the formation of the phases at temperatures below the pearlite point, experiments were carried out on six steels with carbon contents from 0.16 to 1.02%. The transformation velocity in the pearlite phase is proportional to increasing carbon content. This phenomenon is evident in phases just below the pearlite point, where the transformation velocity for ferrite is increased with decreasing carbon content. At still lower temperatures the transformation velocity is slowest in the middle range of carbon content. 17 ref.

133-N.* Nature of Strain-Age Embrittlement. C. J. Osborn. *Iron and Steel Institute, Journal,* v. 188, Feb. 1958, p. 97-101.

Embrittlement which occurs in steel during aging after plastic deformation can be studied conveniently by means of a notched-bar test. Curves showing the progress of embrittlement with time of aging a low-carbon iron at 30 and 80° C. closely resemble the corresponding strain-age hardening curves; it is suggested that both embrittlement and hardening are due to the same basic process. The activation energy for strain-age embrittlement is calculated to be of the order of 20,000 cal per mole, which is the same as for strain-age hardening. 16 ref.

Specimen of pure, polycrystalline Co, previously polished, of hexagonal structure, was heated under vacuum to 500° C., at which point oxygen introduced into the vacuum chamber caused formation of an oxide film. After cooling to hexagonal state, oxide film exhibited appearance of a twinned cubic crystal. Film was removed and surface of metal again attacked, after which original hexagonal grain only was found. These phenomena suggest that under normal conditions transformation nuclei in Co are few, that heterogeneous stresses provoke multiplication of nuclei. Intentionally created quenching and cold working stresses favored nucleation, cubic crystal of the alpha phase gave rise to numerous disoriented hexagonal regions. (N6p, 3-66; Co)

150-N.* **Some Observations of the Effects of Oxygen on the Minority Carrier Lifetime and Optical Absorption of Silicon Crystals Pulled in Vacuo.** G. W. Green, C. A. Hogarth and

F. A. Johnson. *Journal of Electronics and Control,* v. 3, Aug. 1957, p. 171-182.

Techniques and equipment for producing single crystals of Si by pulling from a melt in vacuo; some electrical characteristics of crystals so grown. The minority carrier lifetime decreases radially from the center of the crystals and this behavior is believed to arise from a difference in oxygen concentration, being greater near the axes of the crystals and smaller toward the edges. Optical absorption measurements, which indicate the relative concentrations of oxygen in Si crystals grown by various techniques, suggest that while there is a low concentration in vacuum-grown crystals, there is still a radial variation as postulated above.

151-N.* Anisotropic Diffusion Lengths in Germanium and Silicon Crystals Containing Parallel Arrays of Edge Dislocations. R. L. Bell and C. A. Hogarth. *Journal of Electronics and Control,* v. 3, Nov. 1957, p. 455-470.

Techniques for introducing parallel arrays of edge dislocations into Ge and Si by means of plastic bending. Crystals of Ge with a similar arrangement of dislocations, but with a higher mean minority carrier lifetime than for those subjected to plastic bending, may be grown by pulling from the melt using a suitably orientated dislocated seed crystal. In crystals containing parallel arrays of edge dislocations the diffusion length is no longer independent of direction but is greater when measured along the dislocations than across them. The model used to explain the results suggests that the anisotropies observed will be more marked for crystals in which the dislocations are high polygonized. 12 ref.

163-N.* (Russian.) **Processes of Recrystallization of Nickel Alloys.** M. E. Blanter and L. I. Kuznetsov. *Metallovedenie i Obrabotka Metallov,* Dec. 1957, p. 31-36.

Investigation of Ni alloys for gas turbines. Bimetallic alloys of varying composition were prepared, heat treated at 885° C., and compressed at room temperature. Grain size was determined by method of accidental secants. In Ni-Mo alloys, beginning of softening was marked by a reverse trend in temperature of recrystallization which abruptly rises when Mo reaches 8%. There is a relationship between softening and cold working. Various content of Co, Cr, Ti or Mo changes the character of softening.
(N5, 2-60; Ni)

164-N.* (Russian.) **Distribution of Chromium Between Phases of White Cast Iron.** I. E. Lev. *Metallovedenie i Obrabotka Metallov,* Dec. 1957, p. 49-52.

Analysis of ferrite and cementite in white cast iron shows that Cr is largely concentrated in the carbide form. Distribution of Cr is not permanent but depends on such factors as high temperature and thickness of the poured metal. Cr content in the carbide phase is influenced by the rapidity of cooling. The greater the carbide phase the greater the quantity of ferrite with Cr. Isothermal heating results in greater Cr concentration in the carbide phase. 10 ref. (N8r; CI-p, *Cr*)

165-N.* **Isothermal Transformation of Spheroidized Pearlite to Austenite.** A. A. Golestaneh, C. Handford and G. Bullock. *Iron and Steel Institute, Journal,* v. 188, Mar. 1958, p. 237-241.

Investigation on isothermal transformation of plain carbon steel by electrical resistance technique. Influence of cementite distribution and transformation temperature. Spheroidized pearlite begins transforming earlier than lamellar pearlite. Above 740° C. transformation of lamellar pearlite is completed more quickly. Transformation-time diagrams given.
(N8g; ST)

166-N.* **Study of the Ferritization of Nodular Iron.** Earl J. Eckel. *Modern Castings,* v. 33, Apr. 1958, p. 85-99.

Nodular irons of two compositions were subjected to four types of ferritizing heat treatment; slow cooling through eutectoid range; quenching to and holding at temperatures both below and above the critical temperature for isothermal transformation; reheating of pearlitic structures to various temperatures and tempering of martensitic structures. Results of this response, tensile and impact properties of the treated specimens, quantitative metallography. 11 ref. (N8; CI-r)

167-N.* (English.) **Contribution to the Estimation of M_s from the Composition of Steels.** J. A. Verö. *Acta Technica Academiae Scientiarum Hungariae,* v. 19, Aug. 1957, p. 193-197.

Since starting temperatures of martensite formation vary in a nonlinear fashion, depending on carbon content, previously proposed linear equations give inaccurate results. A parabolic equation is presented which corresponds closely with experimental data. (N8p, ST)

168-N.* (Czech.) **Graphitization of Pearlitic Cementite in Spheroidal Graphite Cast Iron at Hypoeutectoid**

Temperatures. Stanislav Drapal. *Hutnické Listy,* v. 13, Jan. 1958, p. 42-49.

Decomposition of the cementite reveals that spheriodization and coagulation occur first. Graphitization is not pronounced until after a time which increases with increasing Cr content, decreasing temperature and diminishing Si content. During graphitization, Cr in the residual complex cementite increases. The cementite undecomposed increases with increasing Si content. Cr in the cementite is higher in cast iron containing more Si. 20 ref. (N8s; CI-r)

Device for the fusion of highly reactive metals in powder form without the use of a crucible, and with avoidance of any interaction between metal and gaseous phase as well as any contamination of the metal by the material of the heating unit. Single crystals of Si produced. (N3r; Si, 6-68)

209-N. (Czech.) **Structural Stability of 12% Chromium-Tungsten-Molybdenum-Vanadium Steels.** J. Koutsky, J. Neid and J. Jezek. *Hutnické Listy,* v. 13, Mar. 1958, p. 119-206.

Delta ferrite appears besides sorbite in the structure in the refined state with a higher content of tungsten. 21 ref.
(N8, N7; ST, *Cr, W, Mo, V*)

210-N.* (Czech.) **Carbide Reactions in Molybdenum Steels.** Josef Cadek, Bernard Fleischer and Karel Mazanec. *Hutnické Listy,* v. 13, Mar. 1958, p. 206-212.

Reactions at 650° C. during tempering of martensite, isothermal decomposition of austenite and long-term heating of decomposition products. Mo_2C often forms in the austenite decomposition as part of a special eutectoid; Mo_3C forms in the martensite decomposition of steel with 0.38% C and 3.8% Mo.
(N8; AY, *Mo*)

211-N.* (Czech.) **Phase Analysis of Joints Obtained in Resistance Welding of Unalloyed and Low-Alloy Carbon Steels.** Ivan Hrivnak. *Hutnické Listy,* v. 13, Mar. 1958, p. 233-241.

All phases have a lamellar structure. Cementite lamellae in the pearlite are spaced from 10 to 1 micron; distances of carbide lamellae in the troostite and sorbite are from minimum to 0.1 micron. Chromium carbides in carbon-rich, low-alloy chromium steel have grained substructure. Decarburization and spontaneous diffusion of carbon into austenite with final diffusion on gamma-grain boundaries was found. 24 ref. (N8, K3; CN, AY)

212-N.* (German.) **Influence of Extrusion Effect on Strain Hardening of a Heat Treatable Aluminum-Copper-Magnesium Alloy.** H. Richter and G. Wassermann. *Aluminium,* v. 34, Apr. 1958, p. 193-199.

Extrusion effect is an irregularity of mechanical properties with abnormally high strength and yield point and reduced elongation in the extrusion direction, and low values transverse to the extrusion direction; the effect is textural. Brittleness of extruded specimens, which prevents necking, persists during natural aging, but disappears during artificial aging. Extrusion effect also occurs when there is recrystallization in homogenization, provided extrusion texture is preserved. 16 ref. (N7e, Q24g; Al-b, Cu, Mg)

213-N. (German.) **Iron-Nickel-Cobalt Alloys for Glass-Metal Welding.** Horst Hermann and Hans Thomas. *Zeitscrift für Metallkunde,* v. 48, Nov. 1957, p. 582-587.

Tracing of alpha-gamma phase transformation in five alloys by polarization optical method and by measurement of the electrical resistance.
(N6p, M21g, K11a; Fe, Ni, Co)

214-N.* (Russian.) **Composition and Structure of Decarburizing and Transition Zones in Tempered Cast Iron.** K. I. Vashchenko and N. A. Golovan. *Liteinoe Proizvodstvo,* Mar. 1958, p. 16-20.

Observations on cast iron which was annealed at various temperatures in air. Diffusion of P, Mg, Cr and Mn into transition zone which has pearlitic structure and decreases plasticity of metal. Carbides in transition zone have a higher heat resistance than the free cementite. (N8, N1, 2-64; CI)

215-N.* **Solid Solution Hardening.** W. R. Hibbard, Jr. *AIME Transactions,* v. 212, Feb. 1958, p. 1-5.

Evidence confirms previous findings that models of solution strengthening depending solely on lattice parameter changes are incomplete. Direct evidence for the Suzuki interaction of chemical effects was obtained from alloys with constant lattice parameter, for which solution strengthening was nearly independent of temperature from 300 to 20° K. 7 ref.
(N7a, N12p)

216-N.* **Micrographic Investigation of Precipitation in Pb-Sn Alloys.** D. Turnbull and H. N. Treaftis. *AIME*

Transactions, v. 212, Feb. 1958, p. 33-39.

Precipitation of Sn from Pb-Sn alloys (lead-rich) occurs by the nucleation and growth of hemispherical cells which consist of Sn lamellae interspersed in the depleted solid solution. Nucleation and growth of these cells and the Sn interlamellar spacing at various compositions and temperatures. Interlamellar spacing increases approximately as the reciprocal of the logarithm of the supersaturation ratio. 12 ref. (N7b; Pb, *Sn*)

217-N.* Solid Solubility of Uranium in Thorium and the Allotropic Transformation of Th-U Alloys. Wendell B. Wilson, Alfred E. Austin and Charles M. Schwartz. *AIME Transactions,* v. 212, Feb. 1958, p. 52-55.

High-temperature X-ray diffraction studies were conducted with Th-U alloys with up to 10% U. Solid solubility of U in Th as a function of temperature was determined by the method of lattice parameters. Thorium will dissolve up to 2.5% U at 950° C., 4.5% U at 1150 and 7.5% U at 1250° C. Determinations were made of the temperature of the transition of Th and of the effect of U upon the transition. 12 ref. (N12p, N6p; Th, U)

218-N.* Comparison of the Structure of the Omega Transition Phase in Three Titanium Alloys. S. A. Spachner. *AIME Transactions,* v. 212, Feb. 1958, p. 57-59.

Analysis of the powder patterns of the omega transition phase in three binary Ti alloys containing 8% Cr, 13% Mo, and 15% V, respectively, showed that all could be indexed on an orthorhombic unit cell. Unit-cell dimensions were all quite similar. There is evidence for the occurrence of more than one transition phase in Ti-Cr and Ti-V alloys. 4 ref. (N11h, M26; Ti-b)

219-N.* Information on "Nuclei" for Secondary Recrystallization in Si-Fe. C. G. Dunn and P. K. Koh. *AIME Transactions,* v. 212, Feb. 1958, p. 80-84.

Microstructure, magnetic torque and texture data before and after grain growth were obtained on two 3.25% Si-Fe specimens having initially the same cold rolled textures and the same primary recrystallization textures. The textures of the two specimens obtained by grain growth were different. Texture changes observed are considered to favor the oriented-nucleation growth-selectivity theory more than the oriented-growth theory. 17 ref. (N5h, M26c; Fe, *Si*)

220-N. Steady-State Diffusion in Substitutional Solid Solutions. A. S. Yue and A. G. Guy. *AIME Transactions,* v. 212, Feb. 1958, p. 107-112.

Effects of a prolonged flux of Zn atoms through the alpha solid solution of Zn in Cu. 17 ref. (N1c; *Zn,* Cu)

221-N.* Rate of the Carbon-Oxygen Reaction in Liquid Iron. N. A. Parlee, S. R. Seagle and R. Schuhmann, Jr. *AIME Transactions,* v. 212, Feb. 1958, p. 132-137.

Rates of CO evolution and CO absorption were measured for liquid iron alloys containing from 0.15 to 4.4% C, using a modified Sieverts apparatus. Data are interpreted on the hypothesis that the C-O reaction rate is controlled by oxygen diffusion across the boundary layer at the gas-metal and crucible metal surfaces. 7 ref. (N16M, P12; Fe)

222-N. Nucleation of Solid-State Transformations. Morris Cohen. *AIME Transactions,* v. 212, Apr. 1958, p. 171-183.

The 1957 Institute of Metals Division Lecture. 46 ref. (N2, N3)

223-N.* Hydrogen Solubility and Removal for Titanium and Titanium Alloys. W. M. Albrecht and M. W. Mallett. *AIME Transactions,* v. 212, Apr. 1958, p. 204-210.

Solubilities of hydrogen in Ti and several of its alloys were determined at 600 to 1000° C. and pressure of 0.05 to 10 microns of mercury. Solubility increases with increasing beta phase. Factors found to affect degassing rates are specimen size and presence of thick surficial oxide. Removal of hydrogen by heating in vacuum and in flowing inert atmospheres was studied. 10 ref. (N15d; Ti, *H*)

224-N. Effects of the Proeutectoid Ferrite Reaction on the Formation of Pearlite. H. I. Aaronson. *AIME Transactions,* v. 212, Apr. 1958, p. 212-218.

Effects discussed in terms of the influence of transformation strain energies and of the interfacial free energy of austenite-ferrite boundaries on the rate of pearlite nucleation. 13 ref. (N8h, N8j)

225-N.* Further Evidence of Zoning in a Nickel-Chromium-Titanium-

Aluminum Alloy. N. E. Rogen and N. J. Grant. *AIME Transactions,* v. 212, Apr. 1958, p. 218-219.

Investigation to establish whether atomic re-arrangements (zoning) occur in the supersaturated solid solution prior to the actual precipitation of the gamma-phase. 7 ref. (N7, M25; Ni, Cr, Ti, Al)

226-N.* Environmental Effects on Hydrogen Permeation Through Steel During Abrasion. D. E. Swets, R. C. R. Frank and D. L. Fry. *AIME Transactions,* v. 212, Apr. 1958, p. 219-220.

Recent experiments have shown that another group of operations, namely, sanding and grinding, must be added to the already well-established list of phenomena that cause hydrogen to permeate steel. (N1, G18, L10a; ST, *H*)

227-N. Effect of Deformation and Low Temperatures on the Structures of AgCd and AuZn. D. M. Masson and C. S. Barrett. *AIME Transactions,* v. 212, Apr. 1958, p. 260-265.

Martensitic transformations have been found in AgCd both upon cold working at room temperature and cooling to lower temperatures. Crystal structures of the transformation products were found to be close-packed hexagonal in the first case and orthorhombic in the latter. Transformation characteristics also were studied. 22 ref. (N6q, M26, 3-68; Ag, Cd, Au, Zn, 14-68)

228-N.* Phase Transformations in Titanium-Rich Alloys of Titanium and Cobalt. F. R. Swann and J. G. Parr. *AIME Transactions,* v. 212, Apr. 1958, p. 276-279.

Quenched structures were studied in alloys containing up to 12.5% Co. Subsequent decomposition of a 10% Co retained-beta phase alloy was investigated using metallographic and X-ray diffraction methods. Hardness measurements also were made during the decomposition process. Precipitation of Ti_2Co is by nucleation and growth. 9 ref. (N6, N7; Ti, *Co*)

229-N. Electron Micrographic Study of Aging in a Beta Titanium Alloy. F. C. Holden and A. P. Young. *AIME Transactions,* v. 212, Apr. 1958, p. 287-288.

6 ref. (N7b, Ti)

230-N.* Precipitation of Nickel and Copper From Supersaturated Solutions in Germanium. P. Penning. *Philips Research Reports,* v. 13, Feb. 1958, p. 17-36.

Both Cu and Ni atoms can be located at lattice sites (substitutional atoms) or at interlattice sites (interstitial atoms). An exchange between the two types of atom is possible by the reaction: substitutional atom $\rightleftarrows$ interstitial atom + vacancy. The vacancy is an acceptor with only one level in the lower half of the forbidden band, located at 0.02 eV from the valence band. 18 ref. (N7b, M26s; Ni, Cu, Ge)

231-N. Precipitation of Lithium in Germanium. F. J. Morin and Howard Reiss. *Physics and Chemistry of Solids,* v. 3, no. 3/4, 1957, p. 196-209.

Studied by resistivity methods. The kinetics of precipitation follow an exponential law with constants predicted by theory. This indicates that the precipitate particles are approximately spherical. Evidence is found that nucleation centers are vacant Ge lattice sites. 42 ref. (N7b; Ge, Li)

232-N. Mechanism and Kinetics of Age Hardening in Mg-Li Alloy Systems. J. B. Clark. Dow Chemical Co. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131567, Oct. 1957, p. $1.50.

Determination of the habit plane of the Widmanstatten precipitate of the LiZn phase in the cubic Li-Mg solid solution; precipitation of the MgLiZn phase in the cubic Li-Mg solid solution during aging; degree of stabilization attainable through disregistry adjustment by additions of indium to Mg-Li-Al and Mg-Li-Zn alloys. (N7a; Mg, *Li, Al, Zn, In*)

249-N.* (Japanese.) **Observation With a High-Temperature Microscope of Austenite Structure of Carbon Steels Containing Different Amounts of Aluminum.** Shigeo Hasebe. *Sumitomo Metals,* v. 9, Oct. 1957, p. 207-215.

Heat etching austenite structure was observed at 900, 1000 and 1100° C. Effect on grain growth showed stratiform structure in sample with smaller amount of Al. With higher amounts of Al, austenite grain growth was slower at 900 and 1000° C., but higher at 1100° C. Inhibition of grain growth by nonmetallic inclusions was observed in one sample. Heat etching grain was smaller. A thin ferrite band at the heat etching surface of 0.6% carbon steel after slow cooling and precipitation of small globular carbide at the crystalline interface of 18-8 steel was observed, suggesting that heat etching free surface has the characteristics of grain-boundary surface. Oxidation at the surface of heat etching structure will inhibit austenitic grain growth, as will also the grain-boundary character of heat etching surface. 5 ref. (N8, N3, 2-60; AY, *Al*)

257-N.* **Spiral Growth During Vapor Deposition of Cadmium.** W. I. Pollock and R. F. Mehl. *American Society for Metals, Transactions*, Preprint no. 80, v. 51, 1957, 34 p.

Macroscopic spiral growth of Cd upon the basal hexagonal planes of Cd studied during actual deposition from Cd vapor. These spirals, visible at 75X and having heights between 300 and 2000 Å, originated at ridge boundaries of crystals grown on substrates formed by melting and then freezing deposits of Cd which had been previously sublimed from the vapor phase. 12 ref.
(N15g, N12n; Cd)

258-N.* **Crystal Growth of Silver Metal, Mechanism and Kinetics.** Welby G. Courtney. *Journal of Chemical Physics*, v. 27, Dec. 1957, p. 1349-1356.

The crystal growth of silver metal whiskers and "ferns" occurring in the reduction of Ag(I) with Fe(II) from aqueous perchlorate solution was directly observed under the microscope. Whiskers frequently grew at well-defined angles to the previous direction and occasionally stopped growing abruptly although nearby whiskers continued to grow. In fern growth, short spikes grew in a regular manner from only one side of a parallel-sided main stem.
(N3r; Ag)

259-N.* **Adsorption and Diffusion of Oxygen on Tungsten.** Robert Gomer and J. K. Hulm. *Journal of Chemical Physics*, v. 27, Dec. 1957, p. 1363-1376.

Surface diffusion and adsorption of oxygen on tungsten studied by a field emission technique; 80% of the chemisorbed layer can be formed without appreciable activation at 27° K. The layer is stable up to 700° K., where desorption and oxidation start. The latter is markedly dependent on the amount of oxygen on the surface. At 300° K., there is a slow oxygen uptake probably associated with incipient oxidation. (N1a, P13d, W, *O*)

260-N. **Investigation of a Shock-Induced Transition in Bismuth.** Russel E. Duff and F. Stanley Minshall. *Physical Review*, v. 108, Dec. 1, 1957, p. 1207-1212.

Structure of the shock-wave system to be expected in a material which can undergo a polymorphic transition. The slope of the coexistence line in the p-T plane for the transition can be determined from shock-wave measurements at a given initial temperature. Shock waves produced by high explosives were used to investigate the equation of state of bismuth. (N11h; Bi)

261-N.* **Effect of Liquid Media on the Grey Tin ⇌ White Tin Transformation in Commercially Pure Tin.** R. W. Smith and G. V. Raynor. *Physical Society Proceedings*, v. 70B, Dec. 1, 1957, p. 1135-1142.

Dilatometric experiments using xylene, ethyl alcohol, alcoholic "pink salt" solution and distilled water show that the rates of transformation of the alpha→beta and beta→alpha reactions in Sn are affected by the surrounding medium. The alpha→beta rate for material which has undergone one previous beta→alpha change is greater in water or ethyl alcohol than in xylene. All rates increase with temperature up to the highest investigated (29-86° C.), and do not reach a maximum at about 25° C. as reported by earlier workers. (N6p; Sn)

262-N. **Recrystallization of Low-Carbon Steel During Rapid Induction Heating.** B. A. Kuznetsov. *Metallovedenie i Obrabotka Metallov*, no. 2, Feb. 1958, p. 28-35. (Henry Brutcher, Altadena, Calif., Translation no. 4150.)

Study of recrystallization of nonferrous alloys by metallographic and X-ray methods shows that grain size is largely determined by speed of heating. (N5, 2-61; CN-g)

263-N.* (English.) **Production of Oriented Germanium Crystals by the Contact Method.** E. Rubes. *Soviet Physics—Technical Physics*, v. 2, no. 8, (1957), p. 1538-1543.

An application of Czochralski's method has been developed for producing single crystals and bicrystals of Ge, using a Ge contact, from

which crystallization commenced. These crystals are oriented spontaneously in accordance with the temperature field of the apparatus, and are distinguished by well-developed crystal faces. 4 ref.

272-N.* (Portuguese.) **Austenite Transformation: Mechanism of Formation of Pearlite and Bainite.** Michiyasu Doi and Kenkichi Fujimori. *ABM, Boletim da Associacao Brasileira de Metais,* v. 14, Jan. 1958, p. 111-138.

On basis of semistable Fe-C equilibrium diagram, a theory of formation of pearlite and bainite in carbon steels is proposed. Formation of pearlite takes place with simultaneous diffusion of atoms of iron and carbon, and can occur only at high temperatures where mobility of iron atoms is high. Upper bainite would be formed by process similar to formation of pro-eutectoid ferrite; lower bainite would result from mechanism similar to that of martensite transformation. Difference between kinetics of formation of upper and lower bainites can be attributed principally to variations of mobility of carbon atoms with variations in transformation temperatures. 33 ref.

273-N.* Carbide Precipitation in Several Steels Containing Cr and V. Arun K. Seal and R. W. Honeycombe. *Iron and Steel,* v. 31, May 21, 1958, p. 221-225.

Behavior of an alloy steel on tempering depends primarily on the behavior of the carbide dispersion which is formed. While high-chromium steels do not normally show a secondary hardening peak, secondary hardening or more strictly maintenance of primary hardening does occur because of the presence of Cr_7C_3. Comparison of this behavior with that of a 1% V steel (in which V_4C_3 is the effective precipitate) leads to the conclusion that the various alloy carbides differ in their effects partly because of differences in their tendency to remain as a fine dispersion.
(N8a, N7; AY, *Cr, V*)

274-N.* Creep-Resistant Steels. Effects of Tempering on Some Types Containing Cr, Mo and V. E. Smith and J. Nutting. *Iron and Steel,* v. 31, May 21, 1958, p. 226-235.

Microstructural changes occurring during the tempering of a series of 0.2% C steels containing up to 3% Cr, 1% V and 1% Mo. Hardness determined, microstructures examined by electron microscope. Attempt to identify the precipitated carbides by electron diffraction examination of the carbides on the extraction replicas.
(N8a; AY, *Cr, Mo, V*)

275-N.* Low-Carbon Bainitic Steels. K. J. Irvine and F. B. Pickering. *Iron and Steel,* v. 31, May 21, 1958, p. 235-247.

Retardation of the normal polygonal ferrite formation is achieved most successfully with a ½% Mo-B base composition, and can also be obtained with 1% W-B. It is also possible to use a boron-free higher alloy composition containing at least 0.3% Mo. The steel transforms over a wide range of cooling rates to bainitic ferrite, which has superior mechanical properties to polygonal ferrite, mainly because of a much finer grain size. Grain size is controlled by the transformation temperature, which can be lowered by the addition of alloying elements.
(N8m, 2-60; AY)

276-N.* The Metallography of Low-Carbon Bainite Steels. K. J. Irvine and F. B. Pickering. *Iron and Steel,* v. 31, May 21, 1958, p. 247-255.

A relationship was obtained between tensile strength, transformation temperature and structural features. At high transformation temperatures (the lower tensile-strength level), the strength is largely controlled by grain size and, as the transformation temperature decreases, the grain size decreases and the tensile strength increases. From a detailed examination of the isothermal transformation characteristics, a mechanism can be suggested for the formation of low-carbon bainitic structures. The main feature of this reaction is that bainitic ferrite nucleates by a shear mechanism and carbon diffuses away from the growing ferrite plate.

277-N.* Vanadium and Molybdenum Steels. Effect of Ta and Nb on Tempering. Arun K. Seal and R. W. K. Honeycombe. *Iron and Steel,* v. 31, May 21, 1958, p. 256-263.

Small additions of the strong carbide-forming elements Ta and Cb were made to steels of simple basic composition in which V_4C_3 and Mo_2C were the predominant alloy carbides in the tempering range in which secondary hardening occurs. TaC and CbC possess very high melting points, and thus promote stability in carbide phases with which they form solid solutions. Extent to which these additions influence the stability of the carbide precipitates, and the consequent effect on the secondary hardening phenomenon.

(N8a, N8r; AY, *V, Mo, Ta, Cb*)

278-N.* Transformation Characteristics. Variations Within Samples of an Alloy Steel. W. Steven and D. R. Thorneycroft. *Iron and Steel,* v. 31, May 21, 1958, p. 274-284.

Transformation characteristics of 9-gage wires, derived from the top, middle and bottom of 1¼-ton ingots of B.S. En 24 steel, were not markedly different, the greatest difference between transformation times being of the order 2×. Longitudinal and transverse variations in hardenability that existed within the ingot and between the three sizes of material are due to variations in the intensity of microsegregation of the principal alloying elements Ni, Cr, Mn and possibly of Mo and P. (N12, N8, J5, 2-60; AY)

311-N.* (German.) **Relaxation Diffusion and Grain Coarsening in Aluminum.** F. Erdmann-Jesnitzer and H. Hadamovsky. *Aluminium,* v. 34, May 1958, p. 254-263.

Aluminum specimens containing 0.075 and 0.2% Fe which were 70% reduced at 200° C. were annealed at 600° C. and quenched in water, 99.5% cold reduced and then recrystallized by heating for 4 sec. at 560° C. and 3 hr. at 300° C. Critical reductions were followed by recrystallization at different rates of heating. Critical reduction is defined as that reduction for which at specified annealing temperature the deformed structure is just completely recrystallized by grain growth. Effect of relaxation diffusion is greatest at low solubility of alloying elements, particularly when combined with supersaturation.

327-N. Strain Hardening, Recrystallization, and Hot Strength of Alloyed Austenite. L. A. Metashop and M. E. Blanter. *Metallovedenie i Obrabotka Metallov,* v. 4, Apr. 1958, p. 7-9. (Henry Brutcher, Altadena, Calif., Translation no. 4181.)

Relation between strain hardening, the softening process in heating and the characteristics of long and short-time strengths at high temperatures were determined for an austenitic steel with the composition 0.38% C, 0.58% Si, 1.4% Mn, 12.67% Cr, 7.6% Ni, 1.13% Mo, 1.31% V, 0.48% Nb, 0.008% S and 0.015% P. The effects of additional amounts of Cr, Ni, Co and Mo were further studied. (N7e, N5, Q27a, 2-62, 2-60; SS)

328-N. Effect of High-Temperature Aging on the Structure and Proper-

ties of 18-8 Steel. Kh. I. Cheskis and S. I. Volfson. *Metallovedenie i Obrabotka Metallov,* v. 4, Apr. 1958, p. 16-25. (Henry Brutcher, Altadena, Calif., Translation no. 4183.)

A systematic study by metallographic magnetic saturation and electrical resistivity methods of the effect of long-time heating (up to 10,000 hr.) at 500-900° C. on the properties of standard 18-8 steels. 8 ref. (N7, Q-general; SS)

329-N. Effect of Magnesium on the Graphitization of White Cast Iron. A. V. Chernovol and Yu. N. Taran. *Metallovedenie i Obrabotka Metallov,* v. 4, Apr. 1958, p. 49-51. (Henry Brutcher, Altadena, Calif., Translation no. 4189.)

Microstructural analysis of white cast iron (containing 3.0% C, 0.52% Si, 0.32% Mn, 0.021-0.002% S, 0.09% P and 0.01, 0.047, 0.76, and 0.093% Mg) showed no appreciable effect of Mg on the structure. Experimental data did not confirm the hypothesis that the formation of spheroidal graphite resulted in the formation of low-stability carbides in Mg cast iron, nor any sharp slowing down of the graphitization. 5 ref. (N8s, M27, 2-60; CI-r, *Mg*)

330-N.* (Rumanian.) **Structure and Magnetic Properties of Several Alloys of the System Fe-C-Al.** N. Geru, P. Iliescu, A. Moroianu and E. Crucianu. *Studii si Cercetari de metalurgie,* v. 2, no. 4, 1957, p. 397-413.

Structural changes produced by simultaneous increase in carbon (1.1-2.3%) and Al content (3-12%) were analyzed by parallel microscopic and thermomagnetic studies. The cementite was found to change its composition gradually with increase in the Al content; with more than 8% Al, a new epsilon phase with different properties from the cementite, its own characteristic lattice and interesting magnetic properties were obtained. 5 ref. (N8, P16; Fe, *C, Al*)

331-N. (Russian.) **Abnormal Softening of Lead-Tin Alloys at Room Temperature.** L. N. Larikob. *Doklady Bolgarskoi Akademii Nauk,* v. 10, Jan-Feb. 1958, p. 65-68.

(N7; Pb, Sn)

332-N.* Production of Graphite Single Crystals by the Thermal Decompoistion of Aluminum Carbide. L. M. Foster, G. Long and H. C. Stumpf. *American Mineralogist,* v. 43, Mar-Apr. 1958, p. 285-296.

Aluminum carbide, Al_4C_3, dissociates in the vicinity of 2200-2500° C., at atmospheric pressure, to Al vapor and graphitic carbon. Under suitable geometry and heating conditions large, pure, single crystals of graphite can be produced. The crystals have an unusual morphology. In no case is the macroscopic hexagonal symmetry evident. All crystals show growth lines and steps that presumably carry over from the carbide precursor. Twinning and cleavage are common but less frequent than in graphite from other sources. 9 ref. (N3r; NM-k36, 14-61)

333-N.* Time Decrease of Permeability in Iron. G. W. Rathenau. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 239-242.

Measurements on iron containing interstitial nitrogen. Relaxation phenomena with different relaxation times can be resolved. Unequal initial stiffness of the domain walls gives rise to satellites of the main relaxation. Activation energy of the main relaxation and its satellites coincides with that known for bulk diffusion. Short demagnetization of the relaxed material prior to time decrease results in wall movement during the measurement and in apparent longer relaxation times. Method has been applied for the determination of the activation volume for interstitial diffusion. Preliminary results of measurements on single crystals given. 10 ref. (N1; Fe, *N*)

334-N.* (German.) **Critical Consideration of the Formation of Spheroidal Graphite in Cast Iron.** Erich Scheil and Adalbert Wittmoser. *Zeitschrift für Metallkunde,* v. 49, May 1958, p. 256-267.

Three possible types of formation are considered: indirect formation from ledeburite decomposition, direct origin from melt and indirect development from gamma solid solution. (N8s; CI-r)

335-N.* (Japanese.) **Solidification of Pure Aluminum. Pt. 7. The Solidification Constant.** *Light Metals,* no. 30, May 1958, p. 5-10.

When molten Al is cooled by water or mold, and the directional solidification is fixed, the relation between the solidification time (t) and the depth of solidified part (x) is shown by a formula $x = q\sqrt{t}$. The solidification constant (q) contains several variables: temperature of molten Al, cooling water, mold

and thermal properties of solid and liquid Al. Temperature of the molten Al has the most significant influence on the solidification constant. 27 ref. (N12; Al-a)

336-N.* (Japanese.) **Aluminum-Magnesium Casting Alloys. Pt. 5. Investigation of Precipitation of Beta Phase.** Nakamura Yasuji. *Light Metals,* no. 30, May 1958, p. 15-20.

Range of Si content that precipitates the secondary beta phase is 0.06% Si for Al with 10% Mg and 0.03% Si and 0.25% Si for 7% Mg and 13% Mg alloy respectively. (N7, 2-60; Al-b, *Mg, Si*)

337-N.* (Japanese.) **Aging of Al-Cu Alloy by Means of Specific Volume Analysis.** Morinaga Takuichi, Zaima Shigeo and Koshiishi Kazuo. *Light Metals,* no. 30, May 1958, p. 21-25.

Aging of three Al-Cu alloys: 3.116% Cu, 4.240% Cu and 6.200% Cu, respectively. After being kept at 500-520° C. for 30 min., specimens are quenched in water and receive tempered aging at the prescribed temperature. Change of specific volume is then measured. 5 ref. (N7, P10d; Al-b, *Cu*)

338-N.* (Japanese.) **Kinetics of Reaction of Commercially Pure Titanium and Titanium Alloys With O_2, H_2 and N_2.** Kusamichi Hidetake, Yagi Yosiro, Yukawa Toru and Noda Tadao. *Light Metals,* no. 30, May 1958, p. 38-41.

Sponge Ti prepared by the Kroll process and alloying element were arc melted by the consumable electrode double-melting method, and the ingot was forged at 900°, annealed in argon atmosphere at 700° C. and degassed in vacuo. Evolved hydrogen was collected by means of a Bentells pump and measured. (N16m, E25s; Ti, *O, H, N*)

339-N.* (Russian.) **Dispersal of Alloying Elements in Austenic Chromium-Tungsten Steels and Alloys With Varying Nickel Content.** N. F. Lashko and E. Ya. Rodina. *Fizika Metallov i Metallovedenie,* v. 5, no. 2, 1957, p. 261-267.

Phase analysis of austenitic steel with 20-60% Ni and variable W, V and Cb as compared with endurance limit tests. Increase in Ni content reduces solubility of carbon and results in corresponding change in composition of hard alloys, and their heat resistant properties. Addition of 1 to 4% V to alloys containing 20% Cr, 60% Ni and 9% W, gives rise to Me_2C type primary carbide on the basis of metastable carbide Cr_2C containing V and W. (N8r, 2-60; SS, SGA-h)

340-N.* **Solubility and Diffusion of Carbon in a Silicon-Iron Alloy.** D. A. Leak and G. M. Leak. *Iron and Steel Institute, Journal,* v. 189, July 1958, p. 256-262.

Volume diffusion occurs by the same interstitial mechanism as is observed in alpha-iron containing carbon. Carbon atoms in solution also are associated with Si atoms in a similar way to earlier observations on nitrogen in Si-Fe. The solubility of carbon in equilibrium with a precipitated carbide is considerably lower than that for carbon in alpha-iron. 23 ref. (N1e; AY-b; C)

341-N.* **Anodic Disintegration of Austenite of a Rimming Steel During Electrolytic Polishing in Melted Salts.** Zygmunt Wojcik. *Metaux Corrosion-Industries,* no. 392, Apr. 1958, p. 163-170.

Specimens taken from the pure zone of the blooms of a 0.12% C, 0.51% Mn, 0.014% P, 0.026% S rimming steel were austenized for 1 hr. at 1100° C., and immediately subjected to electrolytic polishing at 900-950° C. and the surface features studied with an electron microscope. Anodic disintegration is compared with the inverse of crystal growth from a few secondary centers. 10 ref. (N8, L13p; ST-d)

342-N.* **Mass Spectrometer Measurements of the Diffusion Coefficient of Hydrogen in Steel in the Temperature Range of 25°-90° C.** Robert C. Frank, Don E. Swets and David L. Fry. *Journal of Applied Physics,* v. 29, June 1958, p. 892-898.

Diffusion coefficients for hydrogen in mild steel measured in the temperature range 25 to 90° C. A mass spectrometer was used to study the movement of hydrogen through thin steel plates. Two methods of measuring diffusion have been used: the rate of approach to equilibrium when hydrogen is supplied to the plate; the rate of outgassing when the source of hydrogen is removed. 14 ref. (N1a, S11c; ST, H, 4-53)

343-N.* **Ratio of the Diffusion Coefficients for the Diffusion of Hydrogen and Deuterium in Steel.** Robert C. Frank, Robert W. Lee and Robert L. Williams. *Journal of Applied Physics,* v. 29, June 1958, p. 898-900.

Ratio of the diffusion coefficients for hydrogen and deuterium in steel measured in the temperature range of 26 to 86° C. A mixture of the two gases was introduced into the steel by abrasion in a mixture of normal and heavy water. The diffusion coefficients were measured simultaneously for the two using the mass spectrometer to observe the rate of evolution of the gases from the steel. 6 ref. (N1a; ST, H)

344-N. Solid-State Dissolution of Germanium by Indium in Semiconductor Devices. John Roschen and C. G. Thornton. *Journal of Applied Physics*, v. 29, June 1958, p. 923-928.

Development of small pits or cavities has been observed in Ge semiconductor devices with In metal to Ge semiconductor contacts at temperatures below the melting point of In. The mechanism of cavity formation is a solid-state dissolution of Ge by In with a subsequent more rapid diffusion of Ge in the In, limited by the solid solubility of the Ge in the In. 8 ref. (N1; Ge, In)

345-N.* Study of Order in Annealed and Irradiated Alpha Brass by Lattice Parameter Meaurements. R. Feder, A. S. Nowick and D. B. Rosenblatt. *Journal of Applied Physics*, v. 29, June 1958, p. 984-988.

Increase in short-range order in alpha brass (25 and 30% Zn) produced by thermal treatment or neutron irradiation is accompanied by a measurable decrease in lattice parameter (up to 0.02%). The equilibrium values of the lattice parameter decrease markedly with annealing temperature in the lower range of the measurements (i.e., in the vicinity of 125° C.). The activation energies are given. 13 ref. (N10, 2-64, 2-67; Cu-n)

346-N.* (Italian.) **X-Ray Diffraction Determination of Recrystallization Curves of Reflectal 05 Alloy.** M. Paganelli. *Alluminio*, v. 27, June 1958, p. 263-266.

Study of recrystallization range for 1-hr. anneal revealed that for each degree of prior cold working, temperature of end of recrystallization of Reflectal is higher than that of Raffinal. (N5f; Al-b)

347-N.* (French.) **Diffusion and Chemical Control in the Dissolution of Metals in Mercury.** J. A. R. Bennet and J. B. Lewis. *Journal de Chimie Physique*, v. 55, Feb. 1958, p. 83-90.

Rates of dissolution of cylinders of Pb, Sn and Zn studied and results compared with dissolution of benzoic acid in water, as latter is known as a controlled diffusion process. Whereas dissolution of Pb and Sn is also a controlled diffusion process, it has been found that dissolution of Zn is partially due to a chemical process. To obtain reproducible agitation conditions, coaxially arranged cylindrical specimens were mounted in a revolving cylinder containing Hg. Experiments with Zn monocrystals showed that the different crystallographic faces had different speeds of dissolution. Same phonomenon was noted, qualitatively, for Bi and Cd. 6 ref. (N1a, R2g; Hg, Pb, Sn, Zn)

348-N.* The Martensite Transformations of the Beta Phase in Copper-Aluminum-Nickel Alloys. D. Hull and R. D. Garwood. *Institute of Metals, Journal*, v. 86, July 1958, p. 485-492.

Two types of martensite transformation of the metastable beta phase were observed in an alloy containing 79.5% Cu, 12.8% Al and 7.7% Ni. Both types of martensite form isothermally when the alloy is aged at room temperature after a suitable heat treatment. 24 ref. (N6q; Cu, *Al*, *Ni*)

349-N.* Kinetics of the High-Temperature Heterogeneous Reaction of Chlorine and Nickel Between 1200 and 1700° K. John D. McKinley, Jr., and Kurt E. Shuler. *Journal of Chemical Physics*, v. 28, June 1958, p. 1207-1212.

The kinetics of the reaction of gaseous chlorine with metallic Ni investigated in a constant-pressure flow system in temperature range from 1200 to 1700° K. and at chlorine pressures between 0.08 and 0.4 mm Hg. (N15d, R6q; Ni, *Cl*)

350-N.* On the Growth of Metal Whiskers by Hydrogen Reduction of Halides. W. W. Webb and E. F. Riebling. *Journal of Chemical Physics*, v. 28, June 1958, p. 1242-1245.

Observations of pressures of hydrogen and hydrogen halide gases prevailing during growth of a variety of metal whiskers by hydrogen reduction of volatile metal halides. (N3r; Ag, Cu, Fe, Co, Ni, Mn)

351-N.* (English.) **Contributions to the Study of the Gamma-Alpha Transformation Without Diffusion in Fe-C Alloys.** Butu Rotenstein, Sofia Calogniru and Teodor Teitel. *Revue de*

Métallurgie (Bucarest), v. 3, no. 1, 1958, p. 99-108.

Experimental curves showing variation of the total quantity of the alpha phase as a function of the time for various initial temperatures of the test bar. The determining factor of the transformation without diffusion is the temperature at which this transformation takes place and not the tensions caused by the sudden cooling. 22 ref. (N8; ST)

352-N.* (French.) **Radio-Isotopes in Industry and Metallurgy.** *Métallurgie et la Construction Mécanique*, v. 90, June 1958, p. 449-461.

Use of radio-isotopes to study metallurgical reactions, solidification of metals, the influence of slags and impurities, the movement of the charge and gases and durability of refractories. (N12, S18q, 1-59; RM-h)

353-N.* (German.) **Growth and Characteristics of Metal Whiskers.** F. Blaha. *Radex-Rundschau*, No. 7, Dec. 1957, p. 882-890.

Growth of metal filaments; mechanical peculiarities of whiskers; theories on manner of origin of filaments; interpretation of the mechanical properties according to crystal models. (N3r, N12, 14-61)

354-N.* **Gray Tin Single Crystals.** A. W. Ewald and O. N. Tufte. *Journal of Applied Physics*, v. 29, July 1958, p. 1007-1009.

Method of growing gray tin single crystals from a liquid amalgam. Apparatus and specification of the conditions of growth. 9 ref. (N3r, N12; Sn-a, 14-61)

355-N. **Conditions for Stability of Graphite, Iron and Its Oxides and Carbides.** D. I. Cameron. *Iron and Steel Institute, Journal*, v. 189, July 1958, p. 251-255.

In dealing with iron, carbon and oxygen simultaneously, the two carbides and three oxides cause complications. A simplified method of presentation in terms of the CO and CO_2 percentages of the gases in equilibrium has been worked out to show the regions of stability for Fe_2C, Fe_3C, Fe, FeO, Fe_3O_4, and graphite. 7 ref. (N15d; C, Fe, O)

356-N. **Effect of Boron on Grain Size of Steel.** L. L. Pyatakova and O. D. Zhizhakina. *Metallovedenie i Obrabotka Metallov*, May 1958, p. 27-30. (Henry Brutcher, Altadena, Calif., Translation no. 4220.)

Confirms influence of small additions of boron on the grain growth during heating. The initial temperature of grain growth may be increased by deoxidation and alloying with ferrotitanium. The effect of hot working on the threshold temperature of grain growth was confirmed. The irregularity of grain growth is caused by uneven distribution of boron along grain boundaries. 6 ref. (N3, 2-60; ST, *B*, *Ti*)

357-N. (English.) **Energy of Activation of Self-Diffusion in Some Metals.** Ram Gopal. *Zeitschrift für Anorganische und Allgemeine Chemie*, v. 293, Dec. 1957, p. 53-55.

(N1d)

358-N. (Chinese.) **Recrystallization Texture of Cold Rolled Copper Strips.** Y. Ming-Kao and C. Pang-Hsin. *Acta Physica Sinica*, v. 14, Mar. 1958, p. 95-135.

The change from rolling texture to recrystallization texture may be described as a rotation of 45°, 22°, 38°, about a common (111) axis. Different rates of heating and different annealing procedures produced no significant effect. Temperature of annealing was the main factor. (N5, M26c, 2-64; Cu, 4-53)

359-N.* (French.) **Orientation Relationships Between an Unstable Gamma Phase and the Alpha Phase Resulting From Plastic Deformation of the Latter. Tempering of This Alpha Phase.** Paul Bastien and Rene Margerand. *Comptes Rendus*, v. 246, June 9, 1958, p. 3238-3240.

Corrosion figures were used to study the <110> gamma→ <111> alpha orientation relationship previously revealed by X-ray diffraction of an unstable 18-8 austenitic steel subjected to cold plastic deformation. Tempering of the alpha phase is accompanied by germination and grain growth and leads to a disoriented austenitic phase. (N3, N8a, 2-64, 3-68; SS)

(N4, G1; Al-a)

362-N.* (German.) **Crystal Growth in Sintered Carbides.** Bohuslav Cech.

Neue Hütte, v. 3, May 1958, p. 300-302.

On some Cr, Cr_2-Ni alloys the relations between structural characteristics and strength of carbides are investigated. Grain size of the carbide component as previously observed on WC + Co and Ti + Ni carbides is determined. Influence of the binding component, in particular its crystal size, upon the strength properties of Cr_3C_2-Ni alloys. Grain size depends largely on the sintering time. 9 ref.
(N3m; Cr, Ni, 6-69)

363-N.* (German.) **Influence of Annealing Time Upon the Pearlite-Cementite Phase in a Carbon Steel With 0.86% C.** Helfrid Modin. *Neue Hütte*, v. 3, May 1958, p. 305-306.

Specimens 0.8 mm. thick are heated at 1100° C. and then transferred into a metal bath of 650° C. for times of 2 sec. up to 50 hr. After only 10 sec. about 90% of the austenite was transformed into pearlite. Microstructure observed under light and electron microscope. Microhardness as function of annealing time. (N8h, 2-64; ST)

364-N. (German.) **Diffusion of Ag-Al Alloys.** Th. Neumann and S. Dittrich. *Zeitschrift für Elektrochemie*, v. 61, no. 9, 1957, p. 1138-1146.

Measurements of the diffusion coefficient for Al-rich alloy crystals. 15 ref. (N1a; *Ag*, Al)

365-N. Study of Strain-Hardening and Softening of Iron Alloyed With Manganese. M. D. Perkas. *Metallovedenie i Obrabotka Metallov*, May 1958, p. 8-13. Henry Brutcher, Altadena, Calif., Translation no. 4215.)

Mechanical characteristics of ferrite alloyed with manganese are compared after hardening under various conditions and annealing. Cold working hardened the manganese-alloyed iron more than the unalloyed. Apparently the change in the characteristics of thin structures exposed to cold plastic deformation is one of the basic factors in determining the hardness of ferrite. 9 ref.

379-N.* (Russian.) **Mechanism of Reaction Diffusion of Systems Cu-Se, Cu-Te, Ag-Se, and Ag-Te.** V. I. Arkharov and V. O. Esin. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 246-250.

It was experimentally established that the concentration gradient of "needle-like" sinters in the systems Cu-Se, Cu-Te, Ag-Se and Ag-Te is very small. The crystalochemical character of the lattice phase forming in the sinter (Cu_2Se, Cu_2Te, Ag_2Se, Ag_2Te) explains the great anisotropy of the speed of diffusion and the needle-like orientation of the crystals. The structural picture of the process of reactive diffusion in the systems under examination is related to the fact that the process is limited by the speed of the reaction at the metal-sinter boundary. 5 ref. (N1e; Cu, Ag, Se, Te)

380-N. (Russian.) **Study of Kinetics of Gradual Transformation of Supercooled Austenite.** B. A. Leontev, L. S. Palatnik and Ya. I. Spektor. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 304-317.

Preliminary transformation of austenite steel in interstitial and martensite regions results in sharp acceleration of interstitial transformation at higher temperatures and considerably reduces speed of pearlite transformation. There is a sharp retardation of interstitial transformation at low temperatures under influence of partial decomposition in upper interstitial regions. A considerable role in kinetics of gradual transformation is played by thin austenite structures which arise during martensitic transformation. 24 ref. (N8h, N8p, 2-61; ST)

381-N. (Russian.) **Effect of Superheating on Properties of Structural Steels.** I. E. Kontorovich and B. M. Voshedchenko. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 340-348.

Character of microstructure as result of preliminary superheating followed by recrystallization within wide temperature intervals. Destruction of old austenitic grain boundaries and their reorientation as result of superheating leads to growth of new grains above the recrystallization temperature. 10 ref. (N5p, N3f, N8, 2-62; ST)

382-N. (Russian.) **Double Annealing of Structural Steel.** L. I. Kogan and

R. I. Entin. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 349-354.

Investigation of phase changes in crystal lattice of residual austenite. Annealing at 500-550° lowers carbon content. Relationship between intensity of secondary annealing and extent of reduction of carbon concentration in residual austenitic steel. (N8m, 2-64; ST, SGB-s)

383-N. (Russian.) **On the Kinetics of Preprecipitation in an Alloy of the Duralumin Type.** Marius Protopopescu. *Revue de Métallurgie (Bucarest)*, v. 3 no. 1, 1958 p. 81-97.

Theoretical and experimental study of the structural changes occurring in an alloy of the duralumin type during hardening. 15 ref. (N7; Al-b)

384-N.* **A Look At "Whiskers".** George A. Hoffman. *Astronautics*, v. 3, Aug. 1958, p. 31-33.

Observation of the properties of whiskers reveal metallic whiskers exhibit a plastic range, while most compounds sustain elastic strains only up to failure. The modulus of elasticity of a whisker may differ radically from the modulus of a large polycrystalline modulus. Creep has not been observed in temperatures below the normal recrystallization temperature, implying considerable strength retention even at temperatures close to the melting point. (N12, M26)

385-N.* **The Influences of Gaseous Elements on the Graphitization and the Microstructure of White Cast Irons.** Masao Ibaraki and Taira Okamoto. *Institute of Scientific and Industrial Research, Osaka University, Memoirs*, v. 15, 1958, p. 145-151.

Influence of oxygen and nitrogen which are introduced on red lead (Pb_3O_4) and potassium ferricyanide ($K_3Fe(CN)_6$), respectively, to melt. 6 ref. (N8s; CI-p)

386-N.* **Yield Phenomena in Copper-Arsenic Alloys.** K. Schröder. *Physical Society, Proceedings*, v. 72, July 1, 1958, p. 33-41.

The occurrence of strain aging in single crystals of arsenical copper (0.36% As) has been established by simultaneous determinations of stress-strain curves and changes in electrical resistivity. During yielding the electrical resistance increased more rapidly than normally. The change of resistance during yielding is explained in terms of Cottrell's model of an impurity atmosphere around dislocations. 9 ref. (N7e, P15g Q23b, Q25; Cu, As)

390-N. **Recrystallization Diagram of Molybdenum.** E. M. Savitsky, V. V. Baron and K. N. Ivanova. *Academy of Sciences of the USSR, Proceedings*, v. 113, 1957, p. 355-358. (Translation by Consultants Bureau, Inc.)

Relationship of grain size to degree of deformation and annealing temperature. Above 1300° recrystallization was observed in all deformed and annealed samples. Grain growth at the critical degree of deformation occurred from 1400° (10% deformation). An increase in temperature led to still more intense grain growth, maximum grain size being observed at 7.5% deformation for 1530° and at 2.5% deformation for 1730°, while at higher deformations and the same annealing temperature (1530°, 70%) grain size was considerably less. 4 ref. (N5, N3, M27c; Mo)

Mode of formation of lamellar graphite. Examination of theories on formation and development of spheroidal graphite; indirect formation by decomposition of pre-existing

cementite; direct formation from liquid state; precipitation from solid solution of austenite supersaturated with carbon. 62 ref. (N8q)

392-N.* (Japanese.) **Calcium Treated Cast Iron. Pt. 2. Effect of Calcium-Silicon on the Graphitization of Low-Carbon Iron-Carbon Alloys.** Masuteru Maruyama and Mitsuru Ito. *Japan Foundrymen's Society, Journal*, v. 30, June 1958, p. 479-487.

Graphitization was studied from the point of view of microstructure and the graphitization ratio of castings cast into CO_2 molds. Graphitization temperature of low-carbon Fe-C alloy treated with Ca-Si was considerably lower than that of plain Fe-C alloy, and even in the range of steel compositions, it was between 600 and 800° C., being under the A_1 transformation temperature. Stability of cementite, in the range of low-carbon composition, was remarkably lowered by the effect of calcium. Diffusion of calcium into molten iron progressed with the lowering of carbon content. 11 ref. (N8s; CI, *Ca*, *Si*)

393-N. Effect of Impurities on the Production of Crystallization Nuclei in Supercooled Liquids. D. S. Kamenetskaya. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 33-38.

Crystallization centers form in pure liquids at high degrees of supercooling which are determined by the surface tension at the crystal-liquid interface. The absence of much supercooling in practice is due to active insoluble particles and small amounts of surface-active impurities. The mechanism by which insoluble and soluble impurities act differ: the insoluble act as pre-existing centers; small amounts of soluble impurities materially influence the rate of center formation, which is a consequence of their influence on surface tension and on the activation energy of center formation. 14 ref. (N12n, 3-69)

394-N. Effect of Impurity Diffusion in the Melt on the Distribution in the Crystal During Directed Crystallization. A. I. Landau. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 58-64.

The axial distributions of small impurities in single crystals growing from melts are studied as functions of initial concentration, diffusion coefficient in the melt, rate of crystal growth and equilibrium purification factor. Equations in partial derivatives are derived which describe the impurity distribution in the melt at any time; methods of solution indicated. 7 ref. (N3r; 3-69)

395-N. Thermal and Diffusion Processes in Crystal Growth. G. P. Ivantsov. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 76-85.

The crystal growth rate is determined by the rate of latent heat removal and by the capacity of the substance to crystallize at a definite linear velocity under set conditions (temperature and surface orientation). When the crystal is small and the growth rate very small the system will be isothermal, the effect of uneven temperature distribution will be vanishingly small, and the crystal will adopt a polyhedric shape close to the equilibrium one. If the substance has a high linear crystallization rate and heat removal is rapid a temperature difference will result and "incorrect" growth forms will occur—needles and dendrites. 6 ref. (N12)

396-N. Some Aspects of Crystal Growth in New Phases Arising in Solid Solutions of Metals Observed in the Electron Microscope. N. N. Buinov. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 94-100.

Recrystallization in supersaturated solid solutions inclined to decompose does not occur by new phase nucleation but by the development of submicro regions enriched in alloying component already present in the quenched alloy. The nature of the solid-state crystallization is determined by zone enrichment, followed by enrichment of particles of metastable alloying component phases. The transition from zones to particles of metastable and stable phases occurs allotropically. 18 ref. (N5f, N12p)

397-N. Effects of Modifiers on the Recrystallization of Castings. V. E. Neimark and A. I. Dukhin. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 101-108.

Boron and titanium have different actions on crystal growth in carbonaceous steels: B restricts columnar crystal growth, Ti facilitates the growth of very thin columnar crystals. When the melt crystallizes

in 50-mm. diameter molds B and Ti retard columnar crystal growth in Kh-27 and have no material influence on crystal growth in Kh18N9. Increased heat removal (increased supercooling at the crystalization front) causes the modifiers to have more influence on the nucleation rate in austenitic steel. 10 ref. (N12, ST, *B*, *Ti*)

398-N. Structure and Crystallization Mechanism of Eutectic Alloys. P. S. Vadilo. Paper from "Growth of Crystals". Consultants Bureau, Inc., 1958, p. 109-116.

Zinc-cadmium alloy of eutectic composition consists of large crystals of the main component (up to 1 cm. in size) formed by dendrite growth. The dendrite branches contain small regularly orientated crystals of the second component. The "grain-columns" in a eutectic are dendritic branches of the major component containing normally needle-like inclusions of the second component. 8 ref.

399-N. Study of Processes of Crystallization From Melts. I. N. Fridlyander. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 142-150.

The dendrite branches become finer when cooling rates of Al alloys are increased, the interbranch spaces are reduced, the secondary phase inclusions get finer and are mainly trapped and distributed between the dendrite branches. The strengths of cast alloys increase in step with these structural changes and on heat treatment reach the levels found in forged alloys. Maximum improvement in the properties of the cast metals is effected by continuously pouring a thin layer of liquid metal onto a water-cooled moving grid. 18 ref.

400-N. Formation Mechanism of Graphite Spherules in Cast Iron. I. E. Bolotov, V. I. Syreishchikova and S. G. Guterman. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 163-167.

A necessary condition for graphite to crystallize as spherulites is that the iron be considerably supercooled. Platelet graphite in normal industrial cast irons is due to impurities (sulphur, oxygen), which prevent the iron from being much supercooled since they reduce the graphite-melt interfacial tension and produce (Fe, Mn)S nuclei for the graphite to crystallize on. Modifiers act by purifying the melt from dissolved sulphur and oxygen and destroying (Fe, Mn)S inclusions, so that the supercooling required for spheroidal graphite formation is produced. 15 ref.

405-N. A User Looks at Cleanliness of Vacuum-Melted Alloys. Donald E. Nulk. *Metal Progress,* v. 74, Aug. 1958, p. 103-109.

The problem of "how clean is clean" is becoming more acute with the development of new superalloys containing increased amounts of reactive elements. Carbides and nonmetallic inclusions interfere with fabrication, influence service conditions and decrease the effectiveness of the alloy from the standpoint of chemical balance. Three methods may be used to measure cleanliness: modified A.S.T.M. inclusion rating, frequency/severity rating and metallographic classification.

407-N.* (French.) **Study of the 'Clear Zones' Phenomena in the Structural Hardening of Ni-Cr and Ni-Cr-Mo Alloys.** C. Buckle and J. Poulignier. *Revue de Metallurgie,* v. 55, May 1958, p. 417-429.

The phenomenon of festoons of 'clear zones' known in light alloys as the 'light phenomenon' can be obtained in industrial Ni-Cr and Ni-Cr-Mo alloys by varying rate of cooling after solution heat treatment. If cooling is sufficiently rapid, the phenomenon appears during aging treatment. Its evolution as a function of temperature and time can be followed by micro-examination. Observation on specimens that have undergone creep helps show the manner in which zones participate in plastic deformation of the whole. 6 ref. (N7, 3-68; Cr, Ni, Mo)

408-N.* (French.) **Radiocrystallographic Investigation of Tempered Martensite Carbides Prepared by Quenching Pure Iron-Carbon Steels.** F. Marion and R. Faivre. *Revue de Metallurgie,* v. 55, May 1958, p. 459-469.

Tempered martensite carbides (isolated by electrolytic method) may be considered as a continuous series of nonstoichiometric compounds which approach cementite when the temperature rises or when the duration of isothermal heating is prolonged. Structure is derived from that of cementite by subtraction of carbon atoms. This is represented by a formula. 24 ref.

409-N. (Russian.) **The Ordering Process in Iron-Cobalt Alloys.** G. N. Kaduikova and Ya. P. Selisskii. *Fizika Metallov i Metallovedeniia,* no. 3, 1956, p. 486-496.

Specimens of alloys containing 25.24-49.51% Co and 74.46-48.5% Fe were cold rolled to 82% reduction and annealed at 180-800° for periods from 1 min. to 2 hr. Degree of ordering was determined by measuring electrical resistance and hardness at room temperature. The presence of alloying elements did not play any important part in increasing hardness. The hardening phenomenon is explained by the ordering process which takes place in the distorted lattice of the cold worked metal and which gives rise to additional stresses. It is suggested that a prerequisite of hardening must be a combination of the initial stages of ordering and of recovery when the relief of residual stresses is taking place slowly. (N10; Fe, Co)

410-N. (Russian.) **Diffusion of Indium, Antimony and Tellurium in Indium Antimonide.** B. I. Boltaks and G. S. Kulikov. *Zhurnal Tekhnicheskoi Fiziki,* no. 1, 1957, p. 82-84.

Diffusion coefficients (D) of In, Sb and Te were measured in coarse-grained InSb ingots using the radioactive In^{114}, Sb^{124} and Te^{127} isotopes by the successive layer removal technique. At one and the same temperature, D falls in the order In, Te and Sb. Extrapolation of the data to high temperatures indicates that near the melting point of InSb, all the D coincide. Differences in the activation energies for diffusion of In, Te and Sb in InSb are related to the mechanism of the effect of these elements on the electrical properties of semiconductors (of the hole type). The introduction of Te influences the electronic nature of the conductivity. (N1e, In, Sb, Te)

411-N. Effect of Low-Frequency Vibrations in the Mold on Ingot Crystallization. V. I. Leontyev. Paper from Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 28-31. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Fine granulation of the ingot structure may take place both as a result of the mixing of the molten mass and the effect of considerable variable strains, acting on the growing crystal from the direction of the mold. In the first case dependence on the velocity of oscillations is manifested, in the second, dependence on acceleration. A nonporous ingot may be obtained if the velocity of the oscillations does not exceed that at which ejection of molten mass drop occurs. To obtain optimal results the ingot (artificially or naturally) should break away from the mold and receive impact at its bottom. 4 ref. (N12; 5-59)

412-N. Form Dependence of Crystal Growth on Speed of Growth. V. I. Malkin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958. p. 60-65. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Investigation of the crystallization of Pb ingots under conditions of one-sided thermal withdrawal resulted in immediate changes in the speed of growth; comparison with the structure obtained showed that Pb has a speed of growth above which a columnar structure appears in the development of crystals. With speeds of growth less than 0.1 mm. per min. columnar crystals are not formed. 5 ref. (N12, 3-67; Pb)

413-N. Microstructural Investigation of Martensitic Transformation. O. P. Maksimova and A. I. Nikonorova. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 69-100. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Purpose of investigation was to study the features of the structural forms of martensite produced under varying conditions: upon cooling; in the process of plastic deformation; as a result of cooling of previously deformed austenite. New data on phase hardening occurring in austenite in the course of direct and reversed martensitic transformation. 8 ref. (N8p, 3-68)

414-N. Effect of Deformation on the Speed of the Isothermal Martensitic Transformation in Iron-Nickel-Manganese Alloy. O. P. Maksimova, A. I. Nimonorova and G. K. Pogorelov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 101-113. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Influence of preliminary plastic deformation on kinetics of the isothermal martensitic transformation in an iron alloy containing 22.7% Ni and 3.1% Mn and giving a considerable transformation effect upon deep cooling. The martensitic point, detected upon continuous cooling at a rate of 10° C. per min. is −10°. 14 ref. (N8p, 3-68; Fe, Ni, Mn)

415-N. Phenomenon of Stabilization in Reverse Martensitic Transformation. Ya. M. Golovchiner and Yu. D. Tyapkin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 141-147. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Metals investigated were two Fe-Ni alloys, 27% Ni and 27% Ni, 1.5% Ti, which experience the reverse martensitic transformation alpha→gamma when heated to suitable temperatures. Phase composition of the specimen after heat treatment was determined by X-ray diffraction. The magnetometric method was used to study the general course of the gamma→alpha transformation and determine the martensitic point. 8 ref. (N8p; Fe, Ni)

416-N. On the Processes of Carbide Formation in Isothermal Decomposition of Alloyed Austenite. R. I. Entin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 156-164. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

In the pearlite temperature range even the early stages of austenite decomposition result in formation of special carbides and cementite, with a content of alloying elements that is considerably greater than their average content in the steel. The diffusion redistribution of the alloying elements is a necessary component part of the austenite decomposition. The reduced diffusion speed of these elements compared with the diffusion speed of carbon determines in many cases the slowdown of the austenite decomposition processes. 19 ref. (N8, N1e, 2-60; ST)

417-N. Investigation of the Distribution of Chromium and Tungsten

During the Decomposition of Austenite Using the Radioactive Tracer Method. S. V. Tsivinsky, L. I. Kogan and R. I. Entin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 185-199. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Decomposition of alloyed austenite in the pearlite range of temperatures is caused by the need of diffusion redistribution of the alloying carbide-forming elements (Cr or W) in the austenite. During isothermal decomposition of austenite the relative content of the alloying carbide-forming elements in the carbide phase varies relatively little. The influence of secondary diffusion redistribution of the alloying elements among the decomposition products appears only after the termination of the austenite decomposition. (N8, M23q)

418-N. On the Nature of the Hardness of Tempered Steel. G. V. Kurdyumov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 221-231. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

The high resistance of hardened steel to plastic deformation is determined by the formation of a special micro and submicrostructure, and by the high elastic limits of the martensite crystals in the hardened steel. The basic role of carbon in resistance to deformation lies in the change of the properties of the crystals of the alpha phase, owing to the penetration of the carbon atoms into the alpha-iron lattice. 28 ref. (N8a; ST, 3-68)

419-N. Effect of Austenite Decomposition Upon Rate of Diffusion of Hydrogen in Steel. R. A. Ryabov and P. V. Gel'd. *Fizika Metallov i Metallovedenie,* v. 4, no. 1, 1957, p. 189-190. (Henry Brutcher, Altadena, Calif., Translation no. 4257.)

Anomalies in graphs of hydrogen diffusion rates against temperature in temperature ranges in which decomposition of austenite accelerates. Measurements of diffusion rates of hydrogen through membranes. Factors governing rate of removal of hydrogen from Ni-Cr steels and their significance in connection with hydrogen embrittlement.
(N1, N8, D11h, Q26s; AY, *Cr, Ni*)

420-N. (Russian.) **Structure of Alloys of Iron With Vanadium and Chromium.** M. I. Zakharova. *Doklady Akademii Nauk SSSR,* v. 119, no. 3, 1958, p. 498-500.

X-ray and metallographic studies of structure of Fe-V and Fe-Cr alloys after heating to various temperatures between 600 and 1400° C., followed by quenching into water. Evidence of formation of beta phase (in addition to alpha and sigma phases) having a face-centered cubic structure. (N6p, Fe, *Cr, V*)

421-N. Changes in the Fine Structure of Austenite and of the Kinetics of the Martensitic Transformation Under the Influence of Plastic Deformation. O. P. Maksimova, A. I. Nikonorova and E. I. Estrin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 114-122. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Plastic deformation of Fe alloy with 22.4% Ni, 3.4% Mn leads to sharp increase in stability of the austenite with respect to the martensitic transformation upon cooling. Relatively small deformations, not enough to cause formation of martensite crystals during the reduction process, are already capable in practice of fully preventing the transformation of austenite upon subsequent deep cooling. The increased austenite stability caused by deformation is accompanied by a change in the fine structure of the austenite. 11 ref.
(N8p, 3-68; Fe, *Ni, Mn*)

422-N. Effect of Cooling Conditions on the Kinetics of the Martensite Transformation. O. P. Maksimova and E. G. Ponyatovsky. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 123-133. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Investigation using thermomagnetic method on Fe-Ni-Mn alloy (22.4% Ni; 3.4% Mn; 0.04% C), having a martensitic point of −30. Presupercooling of the austenite contributes to a more intense course of the martensitic transformation, increasing the initial speed of the isothermal transformation of austenite over the entire martensitic range of temperatures. Increase in speed of martensitic transformation becomes more pronounced with increasing degree and speed of pre-supercooling. 15 ref. (N8p; Fe, *Ni, Mn*)

423-N. On the Effect of Hot Plastic Deformation on the Kinetics of the Martensitic Transformation in High-Nickel Steels. O. P. Maksimova, A. I. Nikonorova and G. K. Pogorelov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 134-137. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

High plastic deformation has a substantial effect ending at relatively low temperature (on the order of 700-800°) on the stability of austenite with respect to subsequent deep cooling (on the position of the martensitic point and on the intensity of transformation) in steels containing from 22 to 24% Ni.
(N8p; AY, *Ni,* 3-68)

424-N. Determination of Binding Energy in Austenite Lattices. Yu. V. Kornev. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 312-316. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Since there is a definite relationship between the self-diffusion activation energy and the binding energy in the lattice, the conclusion was drawn that introducing the carbon into the iron reduces the binding energy in the austenite lattice. Data confirm the deduction that the self-diffusion activation energy can serve as a measure of the binding forces in crystalline lattices of pure metals, and permit extending this deduction to interstitial solid solutions. 8 ref. (N8f, N1d; Fe, C)

425-N. Influence of Carbon on the Binding Forces and on the Static Distortions in Martensite Crystals. G. V. Kurdyumov, V. K. Kritskaya and N. M. Nodia. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission.* AEC-tr-2924, 1958, p. 317-321. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Elastic limit of the martensite lattice is several times greater than the elastic limit of the alpha iron lattice. The cause is apparently the large static distortion of the martensite lattice caused by the presence of carbon atoms dissolved in the lattice. 8 ref.
(N8p, N10a, Q21e; ST, *C*)

426-N.* (German.) **Transformation Phenomena Occurring in Patenting Rope Wires After Electric Resistance Heating in Relation to the Mechanical Properties.** Adolf Rose, Leo Rademacher and Karl Schemmer. *Stahl und Eisen,* v. 78, July 10, 1958, p. 966-974.

Austenitization of prepatented and predrawn rope wire containing 0.4 to 0.8% C creates adequate austenite structures when temperature is from 100 to 150° above ferrite dissolution point. Coarser structures may require higher temperatures. Raising temperature, once austenitization is accomplished, has no influence on mechanical properties. Dilatometric examination of isothermal austenite disintegration indicates that presence of carbon accelerates austenite decomposition before, during and after lead-bath. Isothermal experiments do not alter mechanical properties. Changes in direct, indirect resistance heating or operating conditions during patenting have no significant influence on ultimate stress values of wires. 5 ref.
(N8f, J25, 2-64; ST, 4-61)

427-N. (Russian.) **Fine Crystalline Structure of Some Nickel Alloys.** V. G. Chernyy. *Ukrains'kii Fizichnii Zhurnal,* no. 2, 1957, p. 73-75.

Distortions of crystalline lattice and the dimensions of block mosaic (regions of coherent diffusion) in alloys of the Nichrome type (about 20% Cr and 80% Ni, with up to 1.24% Ti and 2% Al) were determined. Alloys were plastically deformed (up to 80%) and subsequently annealed at 400 to 800°. Alloying with Al and Ti increases hardness after plastic deformation and promotes high-temperature strength. The result is explained by a strengthening of interatomic bonds in the crystalline lattice by introduction of Al and Ti into the solution.

428-N. The Concentration of Hydrogen in Nickel Under Hydrogen Ion Bombardment. J. Morrison and J. J. Lander. *Electrochemical Society, Journal,* v. 105, Mar. 1958, p. 145-148.

Observation showed no increase in dissolved hydrogen when clean Ni was bombarded. Considerable increases were obtained at 200° C. when Ni was coated with nickel or barium oxide. Energetic ions penetrate the outer surfaces of the coated materials and are trapped in the interior by surface barriers. This shows that normal values of

concentration cannot be applied to Ni if its surfaces are contaminated. 4 ref. (N15e; Ni, *H*)

429-N. On the Nature of the Change of the Coercive Force Upon Annealing of Hardened Low-Carbon Steel. I. A. Bildzyukevich, Ya. M. Golovchine and G. V. Kurdyumov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 138-140. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Factors playing a substantial role in the strong increase in coercive force are the martensitic transformation proper, which causes the formation of characteristic, inhomogeneous micro and submicrostructures and stresses; properties of the martensite crystals themselves, namely the fact that the martensite is a supersaturated solid solution of carbon in alpha iron; a certain heterogeneity of the hardened steel owing to the presence of a certain amount of residual austenite and a partial decomposition of the martensite. 14 ref. (N8p, 2-64; CN-g)

430-N. On the Diffusion of Cobalt, Chromium and Tungsten in Iron and Steel. P. L. Gruzin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 329-336. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Investigation of the temperature dependence of the diffusion coefficients of Co, Cr and W in the alpha and gamma phases of iron and in carbon steel of eutectic composition. Diffusion coefficients in austenite for all the elements studied differ only slightly. In ferrite at 800-900°, Cr diffuses most slowly and Co most rapidly. W occupies an intermediate position closer to Cr. The diffusion coefficients in steel are almost the same in magnitude for the whole range of temperatures studied. 12 ref.
(N1c; Fe, Cn-b, *Co, Cr, W*)

431-N. On the Problem of Studying Diffusion by the Method of Radioactive Isotopes. P. L. Gruzin and D. F. Litvin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 337-342. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Isotopes of a great number of elements emit simultaneously both beta and gamma rays. If one deposits such an isotope upon the specimen and subjects the latter to a diffusion anneal, then the relation of the measured intensity of the beta radiation of the specimen to that of the gamma radiation will be decreased. Since the ratio of the intensities of the beta and gamma rays are changed conclusions can be drawn about the diffusion in the specimen and a diffusion coefficient determined.
(N1a, 1-59, 14-62)

432-N. Influence of Inter-Grain Structure of Austenite on the Self-Diffusion of Iron. P. L. Gruzin, E. V. Kuznetsov and G. V. Kurdyumov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 343-345. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

The role of changes of intra-grain structure in affecting the speed of diffusion can be shown in alloys in which the transition of austenite into martensite occurs only at temperatures lower than room temperature. Materials used for study were two Fe-Ni-C alloys, one containing 19.8% Ni and 0.45% C, the other 24.6% Ni and 0.69% C. 8 ref.
(N1d, N8p; Fe, Ni, C)

433-N. Influence of Carbon on the Self-Diffusion of Iron in the System Iron-Nickel. P. L. Gruzin and E. V. Kuznetsov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 346-349. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Magnitude of the diffusion coefficients was determined in the temperature range 800-1300° for alloys with 20% Ni and in the range 1000-1330° for alloys with 25% Ni. Carbon weakens the binding forces of the atom not only in gamma iron, but also in the solid solution of a binary Fe-Ni alloy. Influence of carbon on the parameters of self-diffusion in binary alloys decreases with increase of the Ni content. 4 ref. (N1d; Fe, Ni, *C*)

434-N. Influence of Manganese on the Self-Diffusion of Iron. P. L. Gruzin, B. M. Noskov and V. I. Shirokov. Paper from "Problems of Metallography and the Physics of

Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 350-354. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Investigation of the temperature dependence of the self-diffusion coefficient of Fe in the gamma phase of Fe-Mn alloys, by the method of radioactive indicators, using the artificially radioactive isotope Fe^{59}. Both for volume self-diffusion and for self-diffusion between crystallites an increase of the concentration of Mn in the alloy up to 4% leads to an increase in the activation energy and the factor before the exponential. 6 ref. (N1d, Fe, *Mn*)

435-N. Influence of Alloying on the Self-Diffusion of Cobalt. P. L. Gruzin and B. M. Noskov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 355-360. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Alloying Co with up to 7% Cr leads to an increase of the activation energy of self-diffusion, and increases the interatomic binding in the crystal lattice of the alloy. Alloying with up to 4% Ni increases the activation energy of self-diffusion. Thus, even small concentrations of a second or third component can bring about appreciable changes in the binding forces in alloy lattices. 22 ref.
(N1d, M25h, 2-60; Co, *Cr, Ni*)

436-N. Influence of Chromium on the Self-Diffusion of Iron. P. L. Gruzin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 362-364. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Chromium appreciably strengthens the interatomic binding forces in the lattice of gamma Fe and reduces the mobility of the Fe atoms in the range of temperatures below 1100°. It is supposed that carbon weakens the interatomic forces in austenite not only in ordinary steel but also in steel alloyed with chromium. 4 ref.
(N1d, M25h, 2-60; Fe, *Cr*)

437-N.* (Czech.) **Contribution to the Determination of Stability of Kovar Alloys.** Alexander Spirkov. *Hutnicke Listy*, v. 13, 1958, p. 509-512.

Stability determined as function of the square of the characteristic temperature by means of differential thermal analysis. The higher its characteristic temperature, the more stable the Kovar alloy. Kovar alloys containing both alpha and gamma phases show only a mean characteristic temperature; the value of the distortion factor is identical for both phases. Alloys with high characteristic temperature are less susceptible to the gamma-to-alpha transformation than those with lower characteristic temperatures. 5 ref. (N6p, P11; Fe, Ni, Co)

438-N.* (French.) **Study of Cementites With Manganese Substitutions.** Paul Lesage-Bourdon and Andre Michel. *Comptes Rendus*, v. 246, May 5, 1958, p. 2624-2627.

Synthetically prepared samples of ferromanganese containing about 5% Mn were carburized in mixture of CO plus H at 700° C., yielding a Mn-poor alpha phase and a richer gamma phase which become carburized separately and have different Curie points. Homogenization of Mn content is not possible at 700° C., because diffusion is too slow. An anneal at 950° C. provokes decomposition of Mn-poor cementite; stabilized Mn-rich cementite resists this treatment. Specimens stabilized by diffusion of carbon in ferromanganese, heated to 950° C., provided series of homogeneous solid solutions of Mn in cementite. Studies confirmed that Mn largely replaces iron of cementite and exerts powerful stabilizing influence in presence of this carbide. 10 ref.
(N8, 2-64; AD-n, Mn, Fe)

439-N.* (Japanese.) **Ferrite Grain Size and Hardness of Electric Resistance Welded Pipe After Cold Working and Annealing.** Takayoshi Yamamoto. *Sumitomo Metals*, v. 10, Jan. 1958, p. 5-8.

Investigation on mild steel pipe with varying carbon content. Recrystallization occurred at annealing temperature of 600 to 700° C. Tendency for gain growth almost parallel to carbon content. Grain growth greater when cold reduction is about 10%. Both weld and base metal have similar tendency for recrystallization. Grain size is reduced with greater cold working. 16 tables.
(N3, Q29n, 2-64, 3-68; CN, 4-60, 7-51)

440-N.* (Japanese.) **Investigation of NKS-Magnet. Pt. 1.** Toshihiko

Tsunowo and Akira Higuchi. *Sumitomo Metals,* v. 10, Jan. 1958, p. 31-36.

Aging, microscopy, differential thermal dilatation, magnetic analysis and X-ray analysis utilized to investigate samples of alloys of 8 Al, 14 Ni, 24 Co, 3 Cu type. Permanent magnetism did not depend upon simple precipitation of alpha prime or gamma phase but upon nucleation and growth of a certain kind of precipitate. High-temperature X-ray analysis indicates that precipitation had irreversible gamma-to-alpha transformation resembling the FeNi binary system. 10 ref.
(N7b; P16q, X11g, SGA-n)

441-N. (Russian.) **Ordering Mechanism in the Alloy Ni_3Mn With Various Additions of Molybdenum.** B. G. Livshits, B. V. Molotilov, N. N. Myuller and N. A. Savost'yanova. *Fizika Metallov i Metallovedenie,* no. 3, 1956, p. 477-482.

Study of alloys containing 74-75% Ni, 21-23% Mn and 0.64-4 10% Mo, quenched after heating to 1000° to bring them into the disordered state and then annealed at 250-550° for prolonged periods. Electrical resistance investigated; thermomagnetic properties determined by the Akulov anisometer; X-ray analyses. Measurements of normal modulus of elasticity by the resonance method. Data from thermomagnetic measurements show that ordering of the alloy takes place in a heterogeneous manner. The introduction of Mo raises the electrical resistance, and lowers the magnetic saturation; however, these effects are more complicated than merely a concentration disordering.
(N10b, 2-60; Ni, Mn, Mo)

442-N.* (German.) **Kinematics of the Growth of Tin Crystals.** Elias Anastasiadis. *Freiberger Forschungshefte,* no. B-21, 1958, p. 11-91.

Experiments with aqueous solutions of $SnCl_2 \cdot 2H_2O$, with and without additions of HCl. Growth of Sn crystals as they develop in an electrolytic solution was recorded by micro-motion-picture equipment and the influence of different concentrations studied. These crystals formed from solution differ very little from crystals grown in a vapor phase, other solutions or in a melt. (N12e; Sn)

443-N.* (Russian.) **Investigation of Effect of Molybdenum, Chromium and Columbium on Properties of Invar Alloys.** A. Z. Ivanuskina and B. G. Livshits. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 527-535.

Using a dilatometer and electroresistivity tests it was shown that introduction of Mo into permalloy consisting of Ni_3Fe has a negative effect on the ordering of the alloy; however, by increasing Mo above 1%, changes take place in the opposite direction. Thus, there is an increase in electrical resistivity of alloys Ni_3Fe + 2-6% Mo after prolonged low-temperature annealing. 7 ref.
(N10b, P15g, 2-60; Fe, Ni, Cb, Cr, Co)

444-N. Kinetics of Isothermal Conversion of Austenitic Carbon Steel on Induction Heating. I. N. Kidin and Yu. A. Bashnin. *Metallovedenie i Obrabotka Metallov,* v. 4, July 1958, p. 10-15. (Henry Brutcher, Altadena, Calif., Translation no. 4275.)

Austenitic steel shows less stability after induction heating than after heating by usual methods, due to the nonuniformity of carbon and the reduction in size of austenite grains. The decisive factor determining the character of austenitic steel during induction heating is the austenitization procedure—the speed of heating in the region of phase transformations. 9 ref.
(N8g, M27c, J22, J2g, 2-64; CN)

445-N* **Floating Crucible Technique for Growing Uniformly Doped Crystals.** W. F. Leverton. *Journal of Applied Physics,* v. 29, Aug. 1958, p. 1241-1244.

This method, a simple modification of the Czochralski technique, permits the growing of large Ge single crystals of uniform resistivity. (N3r, P15g; Ge, 14-61)

446-N. Variation of the Kinetics of Weakening With the Composition of the Strengthening Phase During Dispersional Hardening. G. V. Kurdyumov, R. I. Entin and V. M. Rozenberg. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 246-256. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

The weakening of steels and alloys is in many cases related to the coagulation of particles of the strengthening phase. Coagulation of the carbide phase during annealing of quenched steel, or dispersional hardening of alloys, leads to a considerable decrease of strength. One of the methods of increasing

the resistance of alloys to weakening at high temperatures consists in delaying the coagulation processes of the strengthening phase by alloying with other elements. Effect of additions of W, Co, and Cb. 4 ref. (N7, Q27c, 2-63, 2-64; ST, Cb, Co, W, AD-n)

447-N. Effect of Sudden Deformation on the Formation of Martensite Lamellae. A. Másin and D. Tlusta. *Ceskoslovensky Casopis pro Fysiku,* no. 2, 1956, p. 225-226. (Henry Brutcher, Altadena, Calif., Translation no. 4275.)

Test pieces of Fe containing 5% Mn and 1% C., oil quenched from 1100° C., with a 1.5-mm. notch, were impact tested on a Charpy machine. The fracture surface and surrounding areas were examined under the microscope. Fine martensite lamellae formed near the fracture surface and were distributed in three ways within the austenite grain; linearly, with martensite needles crossing each other at an angle of 60°; in a mutually perpendicular arrangement; and with martensite precipitated between the differently oriented parts of the mosaic grain. (N8p, 3-68; AY)

448-N. (Latvian.) **Effect of Chemical Composition on Some Details of Martensitic Transformations.** E. L. Vinogradskaya and G. A. Kreslina. *Izvestiya Akademii Nauk Latviiskoi S.S.R.,* no. 2, 1957, p. 153-160.

Alloys of composition C 0.06%, Mn 13.12, Cu 0.28, Co 2.12, remainder Fe, and C 0.12%, Mn 12.93, Cu 1.61, remainder Fe, were studied by the magnetometric method. Specimens were heat treated by soaking at 900° C. and quenching at the rate of 5° C. per min. to −194° C. A complete hysteresis loop was obtained for the reversible martensitic gamma-to-alpha transformation. Increase of C and Cu lowers the Ms point and reduces the amount of alpha-phase obtained when martensitic transformation is complete. Degree of hysteresis of the reversible martensitic transformation is mainly determined by Ms temperature. (N8p; AY, *Mn*)

449-N. (Russian.) **Process of Carbide Formation During the Tempering of Carbon Steel.** B. A. Apàev. *Metallovedenie i Obrabotka Metallov,* no. 1, 1957, p. 2-15.

Study by thermomagnetic method, using "intensity of magnetization versus temperature" curves, of the transformation characteristics during tempering of steels 40, U8 and U12. Phase constitutions of steels of different C contents differ sharply from each other after tempering under identical conditions. The reason for this is the presence of an intermediate χ Fe_5C in medium and high-carbon steels which is absent in low-carbon steels. 55 ref. (N8a; CN)

450-N. (Russian.) **Self-Diffusion of Iron Within Grains and Along Grain Boundaries.** S. Z. Bokshtein, S. T. Kishkin and L. M. Moroz. *Metallovedenie i Obrabotka Metallov,* no. 2, 1957, p. 2-10.

Coefficients of self-diffusion determined by the autoradiographic method, using the Fe^{59} isotope. The investigation was carried out on alpha-Fe at 800° and on gamma-Fe at 1000, 1100 and 1200°. (N1d; Fe)

451-N. (Russian.) **Effect of Heating Rate on Completeness of Recrystallization of Previously Quenched Steel.** B. G. Sazonov and A. S. Zlatkina. *Trudnovoi Institut Fizicheskoi Metallurgii Ural Filial Akademii Nauk SSSR,* no. 17, 1956, p. 20-40.

Effect of heating rate up to 1000° C. per sec. The degree of orientational relationship between the newly forming austenite and the original structure, on heating a quenched steel, determines the degree of development of secondary grain texture and consequently the completeness of recrystallization when the steel is heated. The magnitude of the effect depends essentially on the heating rate. (N5, M27c, 2-61; ST)

452-N. (Russian.) **Effect of Prior Overheating of Steel on the Decomposition Kinetics of Supercooled Austenite.** V. D. Sadovskii. *Trudnovoi Institut Fizicheskoi Metallurgii Ural Filial Akademii Nauk SSSR,* no. 17, 1956, p. 41-66.

Decomposition kinetics in steel 37KhNZA, 40KhSA and 30KhGSA, after factory annealing (as supplied), quenching from the normal temperature and quenching from 1300° C. followed by high-temperature tempering. Prior quenching from high temperatures leads to the nucleation of pearlite-troostite colonies (after subsequent heating to temperatures in the interval between Ac_3 and the c point of Cher-

nov) in the boundaries of the original grains of the overheated metal. This leads to retardation of the transformation process, increasing with increasing original grain size. (N8, 2-64; AY)

453-N. (Russian.) **Effect of Small Concentrations of Alloying Elements on the Self-Diffusion of Iron.** V. V. Sanadza and T. A. Tsivtsigadze. *Trudy Gruzinskogo Politekhnicheskogo Instituta,* no. 1, 1956, p. 141-144.

Effect of small additions of vanadium studied by radioisotope Fe^{59} electrolytically deposited on the specimens. Diffusion annealing was carried out in vacuo at 1050, 1100 and 1150°, and the coefficient of diffusion was determined by removing layers and subsequently measuring the total activity. Activation energies of diffusion of Fe for alloys containing 0.1, 0.25 and 0.4% V were 62, 54 and 40 kcal. per g-atom, respectively. Alloying Fe with even small amounts of V leads to a reduction in the activation energy of diffusion and consequently weakens the binding forces in the crystal lattice of the alloy. (N1d, 2-60, M25h; Fe, *V*)

454-N. (Russian.) **Diffusion of Indium, Antimony and Tellurium in Indium Antimonide.** B. I. Boltaks and G. S. Kulikov. *Zhurnal Tekhnicheskoi Fiziki,* no. 1, 1957, p. 82-84.

The diffusion coefficients of In, Sb and Te in coarse-grained InSb ingots were measured using the radioactive In^{114}, Sb^{124} and Te^{127} isotopes by the successive layer removal technique. At one and the same temperature, diffusion falls in the order In, Te and Sb. Extrapolation of the data obtained to high temperatures indicates that near the melting point of InSb, all the coefficients coincide. Differences in the activation energies for diffusion of In, Te and Sb in InSb are related to the mechanism of the effect of these elements on the electrical properties of semiconductors (of the hole type). The introduction of Te influences the electronic nature of the conductivity. (N1e, P15g; In, Sb, Te)

455-N. (Ukrainian.) **Transformation in Heat Resisting Alloy No. 1 of the Fe-Cr-Al System.** P. P. Kuz'menko. *Naukovi Zapiski Kievskogo Instituta,* no. 5, 1956, p. 135-139.

When an alloy containing Fe 75.34%, Cr 18.35, Al 5.8, C 0.04, Mn 0.18 and Si 0.29, is annealed for long periods at 1200° C. in sealed capsules, its properties alter considerably. After annealing 228 hr. the lattice dimension is reduced from 2.8808 to 2.8660Å, density increased by 5%, microhardness increased by about 3.5 times and brittleness sharply increased. During annealing a new phase is precipitated in the form of hard inclusions. After 228 hr. alpha-to-gamma transformation occurs. It is concluded that as normally made the alloy is not in equilibrium, that equilibrium is reached very slowly and that it is accompanied by decomposition of the single-phase solid solution. (N8; SGA-h)

456-N. Microscopic Study of Transformations in Metal-Powder Compacts Being Heated. Ya. G. Davidovich and K. V. Kononova. *Zavodskaya Laboratoriya,* v. 24, no. 1, 1958, p. 62-63. (Henry Brutcher, Altadena, Calif., Translation no. 4295.)

8 ref. (N8; ST)

458-N. (Russian.) **New Types of Solid Solutions in High-Titanium Slags.** A. V. Rudneva, M. S. Model and T. Ya. Malysheva. *Academy of Sciences of the USSR, Proceedings,* v. 115-117, 1957, p. 27-31.

New series of solid solutions of unlimited miscibility have been discovered and studied: (1) $2MgO \cdot TiO_2$ — $2FeO \cdot TiO_2$ and (2) (Fe, Mg, Mn) $O \cdot TiO_2$ — Ti_2O_3. In addition to the known solid solutions having the Ti_2O_3 (anosovite) structure, the two newly discovered solid solutions also play a very important part in the phase composition of high-titanium slags. 7 ref. (N12p; Ti, RM-q)

459-N. (Russian.) **On Dissolving Graphite in Austenite.** K. P. Bunin and A. A. Baranov. *Metallovedenie i Obrabotka Metallov,* v. 4, July 1958, p. 15-18. (Henry Brutcher, Altadena, Calif., Translation no. 4276.)

Investigation discloses that filling the vacancies formed in austenite during dissolution of graphite has a self-diffusing character. 15 ref. (N1d; ST)

460-N. Growth of Preferentially Oriented Aluminum Single Crystals. Theodore H. Orem. *National Bureau of Standards, Journal of Research,* v. 60, June 1958, p. 547-549.

Method permits growth of crystals having both preferred orientation and any desired cross section. (N3r, M26c; Al, 14-61)

461-N. (Russian.) **Study of the Formation of Crystals of Martensitic Phases by the Microcinematographic Method.** A. L. Belinkii. *Doklady Akademii Nauk SSSR,* no. 4, 1956, p. 556-558.

Formation and rate of growth of martensitic beta-phase crystals in Cu-Sn bronzes containing 24.6-24.8% Sn and of martensite crystals in steel 50N20G2 and also of the effect of prior plastic deformation in the linear growth rate of martensite crystals. Increase in the degree of prior plastic deformation reduces the rate of growth of crystals and makes them adopt a zig-zag, interrupted form. When the temperature is reduced, the growth rate of beta-phase crystals is lowered, which demonstrates the thermal nature of the martensitic transformation.
(N6q, N8p, 3-68; Cu-n; ST)

462-N. (Russian.) **Investigation of the Mechanism of Aging of High-Coercivity Iron-Nickel-Aluminum Alloy.** B. G. Livshits and V. S. L'vov. *Fizika Metallov i Metallovedeniye,* no. 3, 1955, p. 455-458.

Alloy of 27% Ni, 15% Al, remainder Fe, investigated. Coercivity and temperature coefficient of electric resistivity measured at various stages of heat treatment. Supercooled solid solution of Fe, Ni and Al alloy breaks up at 800-850° C. into an Fe phase and a Ni-Al phase. At a lower temperature (700° C.) there is a further decomposition of the Ni-Al phase.
(N7a, P16; Fe, Ni, Al)

463-N. (Russian.) **Study of Phase Composition and Phase Homogeneity Limits of Vanadium-Carbon-Oxygen System. Pt. 1. Vanadium-Carbon System.** M. A. Gurevich and B. F. Ormont. *Zhurnal Neorganicheskoi Khimii,* no. 2, 1957, p. 356-366.

At high temperatures, the alloys are ternary solid solutions of ferrite subject to transformation under annealing or slow cooling; the temperature of the transformation rises continually from 868° C. for FeCr to 1225° C. for FeV.
(N6p, M24c; V, C, O)

464-N. (Russian.) **Transitions in Solid State in Copper-Zinc System in Range of Apha Solid Solution.** A. T. Grigor'yev, Yu. M. Sokol'ovskaya and V. N. Pyatnitskiy. *Zhurnal Neorganicheskoi Khimii,* no. 7, 1957, p. 1547-1551.

Phase transitions are accompanied by formation of the chemical compound CuZn which has a low-temperature modification alpha$_1$ (transition at 233° C.) and a high-temperature modification alpha$_2$ (transition at 452° C).
(N6p; Cu, Zn)

465-N. Recovery of Embrittled Cadmium Plated Steel. H. H. Johnson, E. J. Schneider and A. R. Troiano. Case Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131654, Dec. 1957, 22 p. $.75.

The baking process used to mitigate hydrogen embrittlement during Cd electroplating of steel is not always effective. Influence of Cd electroplate upon the recovery characteristics of hydrogen embrittled steel indicates that the Cd plate strongly deters hydrogen outgassing upon baking and thus delays recovery. This recovery rate decreases as the plate thickness increases.
(N4, Q26s; ST, *Cd,* 8-12)

466-N. (Russian.) **Intercrystalline and Volume Diffusion of Manganese Into Iron.** D. S. Kazarnovskiy. *Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk,* no. 7, 1956, p. 94-102.

A study was made of the frontal diffusion at 1100-1200° C. of Mn into Fe. The diffusion of Mn into ordinary Fe proceeds along a straight front, parallel to the surface of the sample; in high-purity Fe the diffusion takes place predominantly along the grain boundaries. (N1; Fe, *Mn*)

467-N. (Russian.) **Solubility of Zinc in Metallic Compounds Cu_2Mg and Cu_2Cd.** Ye. I. Gladyshevskiy and P. I. Kripyakevich. *Izvestiya Sektora Fizika Khimicheskogo,* v. 27, 1956, p. 209-211.

Solubility of Zn in Cu_2Mg is from 2 to 6 at. %. Solubility in Cu_2Cd

is considerably lower, about 3%. Difference is explained by the greater electron capacity of Cu_2Mg. The computed magnitudes of the limiting electron concentration for Cu_2Mg and Cu_2Cd agree well with data for the solubility of Zn in these compounds.
(M24c; Zn, Cu, Mg, Cd)

468-N. (Russian.) **On the Transformations of the Silicide MnSi.** K. N. Davydov and P. V. Gel'd. *Fizika Metallov i Metallovedeniye,* v. 2, no. 1, 1956, p. 192.

At approximately 600° C. there is a sharp change in the character of the expansion curves of the alloys; a jump is seen in the temperature dependence of the heat content and a rapid decrease in electrical conductivity. This leads to the conclusion that phase transformations may occur in the silicide Mn_5Si at approximately 600° C. (N6p; Mn, Si)

469-N. (Russian.) **Role of the Surface in the Graphitization of White Cast Iron.** K. P. Bunin, I. V. Grechnyi and N. M. Danil'Chenko. *Liteinoe Proizvodstvo,* no. 5, 1955, p. 12-15.

Formation of graphitic inclusions proceeds irregularly over a cross section; they form readily in the surface zones and less so in the center. Where the section is small, graphitization takes place throughout, but is limited in thick parts. The phenomenon is explained by the molecular picture of the process when the formation of graphite is related to the migration of vacancies from the exterior surfaces mainly as a result of the laws of diffusion and dislocations; thicker test pieces require more for complete graphitization. (N8s; CI-p)

470-N.* (Russian.) **Effect of Cooling Rate on Graphitization of White Iron.** O. M. Galemina. *Liteinoe Proizvodstvo,* June 1958, p. 17-19.

Increasing the cooling rate gives rise to formation of disoriented dendrites in center of chill mold, reduces rate of development of eutectoid crystals and leads to formation of shrinkage holes, greater friability and other defects. 9 ref. (N8s; CI-p, 9-67)

471-N. (Russian.) **Some Problems of the Theory of Graphitization of Malleable Cast Iron.** A. A. Egorov. *Nauchneye Trudy Moskovskoe Poligraficheskogo Instituta,* v. 3, 1955, p. 113-134.

Graphitization centers occur during the annealing of white iron only through the indirect decomposition of Fe_3C. Factors are temperature of graphitization — the higher the temperature, the more centers of graphitization are formed; shape and size of Fe_3C crystals—the finer the Fe_3 crystals, the faster the indirect decomposition, other conditions being equal. (N8s; CI-s)

472-N. (Russian.) **Properties of Tin and Tin-Lead Solders at Low Temperatures.** A. S. Medvedev. *Tsvetnye Metally,* no. 2, 1954, p. 52-60.

Effect of additions on the rate of transformation of white to gray tin; up to 0.5% Sb and about 0.3% Bi prevent the transformation. There is also in white Sn a reversible brittle transformation at −30° C. This greatly lowers the impact value of tin solders at low temperatures.

473-N. (Russian.) **Estimation of the Percentage Transformation of Retained Austenite in Spring Strip.** G. E. Egorov, G. T. Nazarenko and V. P. Moiseev. *Zavodskaya Laboratoriya,* v. 23, no. 1, 1957, p. 52-55.

Structural transformations during heat treatment of 70S2kHA strip are followed by measuring the magnetic saturation and coercive force. The saturation was measured by calculation of the contraction between the poles of an electromagnet, and coercive force by the induction method of dropping a measuring coil into an open magnetic circuit in a hollow solenoid. After 1½ hr. tempering at 400° C. there was practically no retained austenite. Martensite decomposes rapidly in the same temperature range. In continuous furnaces in which strip remains for tempering only 35 sec., only 25% of the retained austenite decomposed at 400° C. (N8, 1-54, M23a; ST, SGA-b)

474-N. (Russian.) **Diffusion of Hydrogen Through Iron and Binary Iron-Chromium and Iron-Nickel Alloys at High Pressures and Temperatures.** A. A. Shicherbakova. *Zhurnal Prikladnoi Khimii,* v. 29, no. 6, 1956, p. 879-884.

Speed of diffusion of hydrogen through Fe-Cr alloys at 100 atm.

pressure and temperature from 200 to 600° C. diminishes considerably when the Cr content is increased to 19%. The speed through Fe-Ni alloys increases with addition of Ni from 1.29 to 10%, but further increase of Ni from 10 to 20% causes a considerable reduction in speed.

487-N.* (German.) **Theory and Practical Application of Relief Diffusion.** Hansfriedrich Hadamovsky. *Bergakademie,* v. 9, Dec. 1957, p. 621-624.

The undersirable formation of coarse grains by recrystallization resulting after exceeding a minimum deformation or a certain annealing temperature can be controled by metallic additions. For Al, traces of Mg, Zn, Si, Cu, Mn, Fe promote the critical deformation limit or the temperature limit. This ability increases from Mg to Fe in the sequence shown. An Fe addition of 0.043 at. % (0.09% by weight) delays recrystallization and also reduces the grain notably. 24 ref.

498-N. The Non-Martensitic Diffusionless Transition in Manganese Arsenide at About 40° C. Z. S. Basinski and W. B. Pearson. *Canadian Journal of Physics,* v. 36, Aug. 1958, p. 1017-1021.

It appears that plastic deformation of MnAs is impossible and so, instead of the change following the martensitic pattern, the strain energy of the transformation is minimized by a fragmentation of the crystal grains into pencil-like subgrains. 10 ref. (N6; Mn, As)

499-N. Diffusion of Cerium and Zirconium in Molten Uranium. T. Smith. *U. S. Atomic Energy Commission, NAA-SR-2628,* 1958, 26 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Coefficients measured over the range 1170 to 1480° C. An equation relates the diffusion coefficient and temperature. The diffusion coefficient for Ce at 1200° C. is 1.0×10^{-4} sq. cm. per sec. The solubility of Ce in molten U varies from 1 to 2% by weight over the range 1140 to 1345° C. Experimental errors involved in measuring diffusion coefficients at high temperatures. 6 ref. (N1b, 2-62; Ce, Zr, U)

500-N. Progression of the Freezing Front and the Temperature Distribution in Ingots During Solidification. J. W. Hlinka and V. Paschkis. *American Society for Metals, Transactions,* Preprint no. 97, 21 p.

Progression of freezing and temperature distribution in the liquid and solid regions of a slab-shaped

ingot in terms of the mold-melt interface temperature. The problem is the freezing of a finite slab of pure metal or eutectic alloy contained in a "sufficient" mold; the range of variables included metals commonly used in industry, superheated and nonsuperheated, as well as preheated and subcooled molds, with the conclusion that the dimensionless interface temperature and dimensionless superheat define the progress of solidification and temperature distribution. 4 ref. (N12; 5-59)

501-N. (Czech.) **Crystallization of Metals.** Premysl Rys. *Slevarenstvi,* v. 4, no. 9, 1956, p. 263-267.

Fundamental thermodynamic conditions for spontaneous crystallization characterized by the appearance of supercritical nuclei (homogeneous nucleation). Influence of nonmetallic inclusions and of the walls of the mold on hardening; nature of the crystallization process at the walls; action of various types of nonmetallic inclusions. Examples of the action of inclusions on structure. Methods to obtain fine crystallization structure of metals and alloys. (N12, P12, 9-69)

502-N.* (French.) **Conditions of Regeneration of Single Crystals of Alpha Uranium Containing Traces of Impurities After a Period of Several Hours in the Beta Phase.** Gerard Donze and Rene Faivre. *Comptes Rendus,* v. 246, June 30, 1958, p. 3619-3621.

As previously determined for iron, it is found that regeneration of U monocrystals in alpha phase is due to conservation of crystal nuclei throughout alpha-beta-alpha transformation. Due to anisotropy of expansion of U, this phenomenon is shown very clearly in curves of thermodilatometric analysis. 6 ref. (N6p; U, 14-61)

503-N.* (French.) **Settlement and Diffusion of Hydrogen in Iron.** J. Plusquelloc, P. Azou and P. Bastien. *Comptes Rendus,* v. 246, June 30, 1958, p. 3628-3631.

It is established that H settles in (112) planes. Interruption of electrolysis provokes a greater absorption of H when charging is recommenced. 7 ref. (N1c; Fe, *H*)

504-N. (Russian.) **Problem of the Anisotropy of the Speed of Growth of Crystals.** F. P. Tybalko. *Fizika Metallov i Metallovedenie,* v. 3, no. 1, 1956, p. 184-185.

A cylindrical bicrystal of Al was grown by passing a tube with molten Al (99.98%) through an electric furnace. The separation boundary of the crystals appears on the photograph as a saw-tooth line that parallels the generatrix of the cylinder. X-ray diffraction investigation shows that for one of the crystals the plane of the joint between the crystals, which makes an angle of 10° with the x axis, is the crystallographic plane (112). It is concluded that the rate of crystal growth has a different temperature dependence in different directions. (N12n; Al-a)

505-N. (Russian.) **Influence of Silver or Zinc Impurities in Aluminum on the Speed of Diffusion of Copper.** V. I. Arkharov and N. I. Noskova. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 472-476.

In a solid solution of Ag or Zn in Al, at high content of Ag or Zn (10 to 20%), the speed of diffusion of Cu is substantially greater than in pure Al. An explanation is offered for the previously established accelerating influence of small impurities (0.2%) of Ag (or Zn) on the speed of decomposition of supersaturated solid solution of Cu in Al. This can be caused by the positive internal adsorption of Ag (or Zn) taking place on the periphery of the produced particles of the phase that becomes precipitated from the very beginning stages of their formation, due to the particles turning out to be surrounded by zones of solid solution with increased concentration of Ag (or Zn). (N1e; Al-b, Ag, Zn, Cu)

506-N. (Russian.) **Cast Iron Sheet, Its Crystallization and Plastic Deformation in Cold and Hot States.** Ye. G. Nikolayenko and S. I. Vitenzov. *Novoye v Teorii i Praktike Liteynogo Proizvodstvo, Moskva-Leningrad Mashgiz,* 1956, p. 409-419.

Effect of conditions of primary and secondary crystallization and plastic deformation in cold and hot states on the structure and properties of cast iron sheets obtained by liquid rolling.
(N12, N5, Q24; CI, 4-53)

507-N. (Russian.) **Processes of Carbide Formation in Isothermal Decom-**

position of Alloyed Austenite. R. I. Entin. *Problemy Metallovedeniya i Fiziky Metallov,* v. 4, 1955, p. 239-250.

Structure of the carbide phase in Mo, Co-Mo and W steels investigated during the process of transformation at temperatures of the pearlite and intermediate regions, also after special binary treatments. Decomposition of the austenite in the pearlite temperature region in steels alloyed by carbide-forming elements is due to the formation of a carbide phase that is enriched with these elements, and consequently to a diffusion redistribution of the alloying elements. (N8r; AY, *Mo, Co, W*)

508-N. (Russian.) **Study of Auto-Diffusion of Alpha-Iron.** B. M. Golikov and V. T. Borisov. *Problemy Metallovedeniya i Fiziky Metallov,* v. 4, 1955, p. 528-542.

Modification of the absorption method, proposed for determination of small auto-diffusion factors, requires no preliminary determination of the absorption factor of the beta-radiation of the radioactive indicator. The processes taking place in the active layer and on the separating boundary layer-sample are taken into consideration. How to take the isotope composition of the compound into consideration is shown. Equation for the auto-diffusion of alpha-iron within the temperature interval from 650° to 850° is given. (N1d; Fe)

509-N. (Russian.) **Investigation of Diffusion Processes in Sintering Using Radioactive Isotopes.** L. M. Mirskiy, V. S. Rakovskiy and S. Z. Bokshteyn. *Poroshkovaya Metallurgiya, Yaroslavl',* 1956, p. 52-60.

Procedure developed made it possible to conclude that the ideas concerning the "hole" mechanism of diffusion are correct. The coefficients of diffusions determined for the alloys W-Ni, TiC-Mo, TiC-W and TiC-Cb coefficients make it possible to calculate the activation energy of W, Mo and Cb and consequently to determine the strength of the bond in the lattice.
(N1e, 1-59; H15; W, Ti, Cb)

510-N. (Russian.) **Investigation of the Process of Crystallization of a Solid Solution.** L. P. Zaytseva. *Trudy Leningradskogo Politekhnicheskogo Instituta,* no. 180, 1955, p. 13-31.

Crystallization of a solid solution under actual cooling conditions investigated in 14 alloys of the Cu-Si, Cu-Si-Mn, Al-Zn and Sb-Bi systems. Ratio of liquid and solid phases during crystallization process was fixed for each given instant by hardening, after which a metallographic investigation was made of the structure of the alloys on microsections, and microhardness measured. Change of concentration of the separating initial dendrites and of the parent solution was investigated by ultraviolet color microscope and local spectrography.
(N12p, Cu-b, Al-b, Sb-b)

511-N. (Russian.) **Investigation of Diffusion in Binary Alloys as a New Method of Physical-Chemical Analysis.** M. V. Neyman and A. Ya. Tsinyayev. *Zhurnal Neorganicheskoi Khimii,* v. 1, no. 6, 1956, p. 1257-1263.

The change in the coefficient of diffusion, D, the energy of activation, E, and the coefficient of the exponential D_0, as functions of the composition of the alloys were determined in Fe-Ni and Fe-Mo systems. In the Fe-Ni system, which in the temperature region from 900 to 1100° C., represents a continuous series of solid solutions of nickel in iron, D increases continuously, while E and log D_0 diminish continuously as functions of the alloy composition. In the Fe-Mo system, which contains the compound Fe_3Mo_2 in the temperature range 100 to 1200° C., D diminishes sharply and E and log D_0 increase sharply at the point corresponding to the chemical combination.
(N1e; Fe, Ni, Mo)

512-N. (Russian.) **Investigation of the Tempering Processes in an Iron-Nitrogen System.** V. G. Permyakov. *Metallovedenie i Obrabotka Metallov,* no. 7, 1956, p. 2-9.

Structure of commercial iron, hardened after nitriding at 600 to 900° C., and its variations in tempering. Observation of the nitrided austenite and martensite obtained in the nitride layer during heating shows a far-reaching analogy between the tempering of hardened iron nitride and iron carbide alloys. Tempering begins with the decomposition of the martensite, on which is superimposed at 190 to 310° C. the decomposition of the residual austenite. As a result of one or the other a mixture of ferrite and of a nitride gamma-prime phase of different dispersions is formed.
(N8a; Fe, N)

513-N.* **Conditioning Phenomenon in a High Chromium Steel.** S. C.

Das Gupta. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 207-217.

A 15% Cr, 0.7% C steel is studied under various conditions: without presence of initial martensite; in presence of initial martensite; plastically deformed specimens without any initial martensite. The degree of conditioning increases progressively with temperature of reheating above 300° C. However, in presence of initial martensite, an important change in the mode of formation of some of the martensite plates occurs above 450° C. 5 ref. (N8p; AY, *Cr*)

514-N.* A Study of the Early Stages of Tempering in a 0.2% C, 9% Cr and 0.38% V Steel. A. K. Seal. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 73-88.

Mechanism of the early stages of tempering studied by long-time isothermal tempering at 170° C. for up to 1000 hr. Specimens were examined by hardness measurements, optical and electron microscopic studies, X-ray examinations of the carbide extracts and electron diffraction studies of the extraction replicas. It was found that the iron carbide formed at this temperature possessed an imperfect cementite structure. An attempt has been made to correlate the hardness and electron microstructural changes on tempering. 5 ref. (N8a; AY, *Cr, V*)

515-N.* (French.) Determination of Coefficients of Diffusion and Study of the Kirkendall Effect on the Couple Uranium-Titanium. Yves Adda and Jean Philibert. *Comptes Rendus,* v. 247, July 7, 1958, p. 80-83.

Concentration-penetration curves in U-Ti diffusion couple between 950 and 1075° C., coefficient of chemical diffusion determined as function of concentration. Quantitative study of Kirkendall effect; coefficients of intrinsic diffusion of U and Ti calculated. 4 ref. (N1e; U; Ti)

516-N.* (French.) Influence of Tungsten on the Kinetic Parameters of the Formation of Proeutectoid Ferrite. Karel Mazanec and Josef Cadek. *Revue de Metallurgie,* v. 55, June 1958, p. 501-512.

Tungsten decreases speed of nucleation of proeutectoid ferrite in temperature range 675-745° C. virtually independently of temperature. In low-temperature domains (below 650° C.), W causes decrease in rate of grain growth, while this rate remains practically constant at temperatures above 740° C. Role of time in speed of nucleation was also investigated. After period of incubation, speed of nucleation increases rapidly and, after reaching a maximum, decreases according to a hyperbolic curve. Speed of grain growth follows same hyperbolic pattern. Activation energy (33,600 cal. per mol.) proves that speed of growth is controlled by speed of diffusion of carbon in austenite. 21 ref. (N2, N8j; 2-60; AY, *W*)

517-N.* (French.) Determination of Volume Self-Diffusion Constants of Iron in the Alpha Phase by Means of Radioactive Isotopes. Claude Leymonie and Paul Lacombe. *Revue de Metallurgie,* v. 55, June 1958, p. 524-530.

A layer of Fe^{55} and Fe^{59} radioisotopes is deposited on surface of thin platelets of Armco iron. During a diffusion anneal under vacuum, activity of both sides of sample is measured periodically. A ratio exists between variation of measured activities and coefficient of diffusion. Experiments were conducted on polycrystalline specimens at temperatures above 850° C., on monocrystals at temperatures under 850° C. Under conditions described, variation of coefficient of diffusion D at absolute temperature T can be expressed by $D = 18 \exp. (-64000/RT)$. 8 ref. (N1d, 1-59; Fe)

518-N.* (Italian.) Influence of Zirconium in Association With Manganese on Recrystallization and Mechanical Properties of Ac 11 Alloy Extrusions. E. Di Russo and D. Gualandi. *Alluminio,* v. 27, July-Aug. 1958, p. 321-329.

Six Al alloys, three with and three without Zr additions, were studied. Recrystallization structure of extrusions is improved by addition of 0.15-0.20% Zr in presence of 0.3-0.4% Mn. This composition makes it possible to avoid stains, marbling and other undesirable effects caused by segregation of intermetallic compounds of Al-Mn and Al-Fe-Mn in anodized Ac 11 alloy when Mn content is 0.7%. Improvement in mechanical properties noted. 7 ref. (N5, Q-general, 2-60; Al-b, *Zr, Mn,* 4-58)

519-N. (Russian.) **Anisotropy of Crystal Growth Speed.** F. P. Rybalko. *Fizika Metallov i Metallovedenie,* v. 3, no. 1, 1956, p. 184-185.

It was found on X-ray study of a monocrystal of Al (99.98%), grown in a melt, that the crystal growth speed in different directions depends on temperature. (N3r; Al-a)

520-N. (Russian.) **Mechanism of Structural Transformations in Aging Alloys With a Nickel Base.** Yu. A. Bagaryatskiy and Yu. D. Tyapkin. *Kristallografiya,* v. 2, no. 3, 1957, p. 419-423.

X-ray structural method (oscillation X-ray photographs by "transmission" and by "reflection" in K_o-Cr, Fe, Ni, Cu, and Mo radiation) and X-ray photographs of diffusion scattering in K_o-Mo radiation have been used to study the aging of single crystals of alloys Ni-Al, Ni-Ti, Ni-Cr-Al, Ni-Cr-Ti, Ni-Al-Ti, including the Nimonic-80 type of alloy. The alloys become inhomogeneous even in the region of equilibrium solid solutions (1200-1300° C.). The dimensions of the irregularities observed in the hardened alloys depend on the content of Ti and Al and on the heating temperature. (N7a, M22g; Ni-b, 14-61)

521-N.* (English.) **Solution Anisotropy and Shape of Solution Body in Crystals.** Mikio Yamamoto. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 183-200.

Derives from phenomenological considerations, taking into account crystal symmetry, the expressions for anisotropy of the solution rate and for the shape of the solution body in hexagonal, rhombohedral, tetragonal and cubic metal crystals. Data from theoretical formula for anisotropy of solution rate in accord with available experimental values. 13 ref. (N12, M26)

522-N.* (English.) **Diffusion of Silicon and Manganese in Liquid Iron. Pt. 1. Diffusion in Liquid Iron Saturated With Carbon.** Tunezo Saito and Kazuo Maruya. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 259-268.

Diffusion coefficient determined for temperatures between 1300 and 1600° C. by the method of "semi-infinite medium". Diffusion coefficients of Si were 2.0 to 2.8 $\times$ 10^{-5} sq. cm. per sec. and activation energy of 8.2-k. cal. per g. atom. Diffusion coefficients of Mn were 3.0 to 4.1 $\times$ 10^{-5} sq. cm. per sec. and activation energy was 5.8 k.cal. per g. atom. 10 ref. (N1b; Si, Mn, Fe. 14-60)

523-N. (Russian.) **Decompositon of Solid Solution in Thin Laminae.** M. I. Zakharova and I. N. Soboleva. *Doklady Akademii Nauk SSSR,* v. 108, no. 5, 1956, p. 841-842.

Using X-ray diffraction and the variation of the lattice constant during tempering, an investigation was made of the dependence of the decomposition process on the dimensions of the specimens. Specimens 0.4, 0.02 and 0.004 mm. thick of a solid solution of Cu in Al were hardened and annealed for 1 hr. at temperatures from 180 to 320° C. After tempering at 180, 200, 220, 240, 300 and 320° C., the lattice constant of all the specimens was found to vary smoothly (i.e., homogeneous decomposition of the solid solution took place). After tempering at 260 and 280° C., the thinner specimens (0.02 and 0.004 mm.) exhibited regions of solid solution with a different degree of supersaturation. (N7, M26p, 1-60; Al, *Cu*)

524-N. (Russian.) **Recrystallization. Diagrams for Titanium and Titanium Alloys.** E. M. Savitzky, M. A. Tylkina and A. N. Turnaskaya. *Izvestiia Akademiia Nauk USSR, Otdelenie Tekhnicheskikh Nauk,* no. 7, 1956, p. 111-114.

Recrystallization diagrams of titanium iodide and titanium thermal magnesium (brand BTI-D) are plotted, which link together the size of metal grain with the deformation degree and with the subsequent annealing temperature or with the hot deformation temperature; recrystallization of hot rolled Ti calcium hydride also studied. (N5; Ti)

525-N. (Russian.) **Dependence of the Crystal Growth Shape on the Growth Speed.** V. I. Malkin. *Problemy Metallovedenya i Fiziky Metallov,* v. 4, 1955, p. 113-120.

Dependence of growth shape on growth speed of a salol crystal growing in a melt and the connection between growth speed and the

structure in an ingot of Sn. The transition to an acicular growth shape is observed, when growth speed of the crystal increases. When undercooling is decreased, growth speed decreases also, and the growth of crystals of acicular shape is replaced by the growth of crystal of regular shape. The same transition to an acicular structure with the increase of growth speed was observed also in an ingot of Sn.
(N12; Sn)

526-N. (Russian.) **Effect of Elements That Form Difficultly Soluble Carbides on the Decomposition of Austenite.** L. I. Kogan and P. I. Entin. *Problemy Metallovedenya i Fiziky Metallov,* v. 4, 1955, p. 251-286.

When hardening from ordinary heat treating temperatures (900 to 1000° C.), the presence of such strongly carbide-forming elements as Ti, V, Zr, Cb and Ta reduces the hardenability of carbon steel, owing to the formation of quite stable carbides by these elements. A partial transformation of these carbides into austenite when heating to 900 to 1000° C. can be accomplished by alloying the steel with manganese (1.5 to 2.5%). In this case, addition of Ti to Mn steel increases considerably the stability of the austenite in the pearlite and intermediate regions.
(N8r, 2-60; AY, *Mn, Ti*)

527-N. (Russian.) **Radioactive Tracer Investigation of the Distribution of Chromium and Tungsten During the Process of Austenite Decay.** S. V. Tsivinskiy, L. I. Kogan and R. I. Entin. *Problemy Metallovedenya i Fiziky Metallov,* v. 4, 1955, p. 277-295.

Radioactive isotopes used to determine the contents of Cr and W in the carbide phase in steels with 1.18% C and 2.42% Cr and with 1.02% C and 0.78% W, respectively, in the process of transformation of austenite at the temperatures of the pearlite and intermediate regions. In the process of decomposition in the pearlite region, contents of the alloying elements in the carbides exceed their contents in steel by a factor of 3 to 5 times. Results prove that decomposition of the austenite in the pearlite region is connected with the need for diffusion redistribution of tungsten.
(N8h, 2-60, 1-59; AY, *Cr, W*)

528-N. (Russian.) **Influence of Alloying Elements on the Eutectoid Transformation in Steel.** N. T. Gudtsov and I. Chadek. *Sbornik Moskovskogo Instituta Stali,* v. 36, 1957, p. 13-32.

Investigation of carbide phase of the products of isothermal eutectoid transformation, of carbide phase formed during prolonged annealing of these products at the same temperature and of carbide phase of the products of tempering of martensite. Role of kinetic factors in eutectoid transformation; formation of the cementite is not a primary factor in the eutectoid reaction even when the latter is one of the stable carbide phases of the particular steel. (N8r, 2-60; AY)

529-N. (Russian.) **Relaxation and Recrystallization of Single-Phase and Aging Alloys With a Nickel Base.** S. S. Gorelik, Yu. V. Gracheva, N. O. Borneyev, I. G. Skugarev and E. N. Spektor. *Sbornik Moskovskogo Instituta Stali,* v. 36, 1957, p. 103-130.

Influence of 1 to 20% Cr on recrystallization temperature of Nichrome. Compared with Ni, Nichrome has a considerably higher recrystallization temperature. Introducing into Nichrome alternately B, Mo and W, while retaining the single-phase nature of the alloy, has little effect on the temperature of the start of recrystallization but shifts the temperature of the end of recrystallization upward. Introducing elements that cause aging leads to a considerable increase in recrystallization temperature, with the strongest effect being exhibited by Al, Ti, Al + Ti, Al + Ti + Mo, Al + Ti + Mo + W.
(N5, 2-60; Ni-b)

530-N. (Russian.) **Effect of Tungsten on the Kinetic Parameters of the Formation of Ferrite in Isothermal Transformation of Austenite.** I. Chadek and K. Mazanets. *Sbornik Moskovskogo Instituta Stali,* v. 36, 1957, p. 147-159.

In the range from 675 to 740° C., W reduces the speed of formation of nuclei, and the rate of increase diminishes noticeably with increasing W, particularly at low temperatures (below 650° C.), and hardly diminishes at higher temperatures (about 745° C.). At greater supercooling, rate of growth is determined by diffusion of carbon in the austenite, and at smaller supercooling, by formation of double nuclei. Rate of formation of nuclei diminishes at small degrees of super-

coolings, due to the influence of W on surface tension at the boundary of the gamma grain.
(N8g, 2-60; AY, *W*)

531-N. (Russian.) **Theory of the Growth of Centers of a New Phase in Isothermal Decomposition of Austenite.** B. Ya. Lyubov. *Trudy Nauchno-Tekhnicheskogo Obshchestva, Chernoy Metallurgii,* v. 3, 1955, p. 39-44.

Theoretical analysis of the growth of centers of a new phase in the isothermal decomposition of supercooled austenite. The new phase (ferrite, cementite or pearlite) differs from the initial one (austenite) in its structure as well as in its composition. Consequently, the redistribution of the dissolved matter combines in the phase transition with the transition of the solvent from one structural form to another. The kinetics of the growth process of the center, by which the particular components of its simple processes cause a minimum rate of displacement of the boundary between the phases, are determined. (N8g)

532-N.* **The Preparation and Properties of Gallium Arsenide Single Crystals.** J. M. Whelan and G. H. Wheatley. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 169-172.

Preparation of gallium arsenide single crystals by the floating-zone method. These crystals have resistivities in the range 10^{-2} to 10^{-6} omega-cm. Hall coefficient and conductivity were measured for five n-type samples in the temperature range 50-900° K. An impurity level 0.54 ± 0.05 eV below the conduction band is believed to be responsible for the high-resistivity sections of the crystals. 12 ref.
(N3r, P15, Ga, As, 14-61)

533-N.* **Diffusion, Solubility and Electrical Behavior of Copper in Gallium Arsenide.** C. S. Fuller and J. M. Whelan. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 173-177.

Copper diffuses into GaAs single crystals at rates comparable to those found for Cu in Si and Ge. As with Ge, the diffusion appears to follow the dissociative mechanism. Autoradiographic evidence for this. The diffusion process requires both interstitial and substitutional roles for Cu. Solubility of Cu in single crystals of GaAs determined from 700 to 1160° C. by means of Cu^{64}. 10 ref. (N1, P15, Cu, Ga, As)

534-N.* **Thermodynamics of Ordering Alloys. Pt. 3. Energies of Transformation of the $Au_{\frac{1}{2}}Cu_{\frac{1}{2}}$ Phases.** R. A. Oriani and W. K. Murphy. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 277-279.

Energy differences among the two superlattices and the disordered solid solution at the composition $Au_{\frac{1}{2}}Cu_{\frac{1}{2}}$ have been derived from calorimetric measurements of the heats of formation of the three phases. It is shown that neither of these transitions is understood in terms of quasi-chemical theory. 10 ref. (N10b, P12q; Au, Cu)

535-N. (Czech.) **Setup for Growing Single Crystals of Metals.** Bohdan Sestak. *Ceskoslovensky Casopis pro Fysiku,* v. 7, no. 2, 1957, p. 202-208.

Crystals were grown in an atmosphere of argon at atmospheric pressure. Protective atmospheres are purified of oxygen and dried in a special apparatus during growth of the single crystals. Procedure of growing single crystals of Cu and Ni is by the Bridgeman method. Cu crystals of 12 mm. diameter and 99.95% purity were grown in a graphite crucible at velocities of 37.2 to 76 mm. per hr., and Ni crystals 99.85% pure and 15 mm. in diameter were grown in a crucible made of pure sintered Al at a crucible displacement rate of 9.1 to 25 mm. per hr. (N3r; Cu, Ni)

536-N.* (German.) **Essential Features of the Discontinuous Precipitation in Zinc-Copper and Copper-Silver Alloys.** W. Gruhl and H. Kramer. *Metal,* v. 12, Aug. 1958, p. 707-712.

In discontinuous precipitation the grain boundary moves into the adjacent crystal. By tests with an alloy of Zn and electrolytic Cu, process of discontinuous precipitation and correlation between discontinuous and continuous precipitation is shown. Displacement of grain boundary explained by liberated energy resulting from the boundary itself as well as from the solid solution. 15 ref. (N7; Zn, Cu, Ag)

537-N.* (Japanese.) **Precipitation of Alpha Phase in Magnesium-Lithium**

Beta Phase Alloy by Preferential Oxidation of Lithium. S. Morozuni, S. Matsuo and T. Takeuchi. *Nagoya Industrial Experimental Station, Report,* v. 7, July 1958, p. 504-510.

Specimens are Mg alloy with 11% Li beta phase, cold pressed, cut, annealed at 350° C. and then heated at 500° C. in silica tube under 10^{-2} mm. Hg. Fine precipitates are found along the grain boundary of the matrix, which was a single-phase solid solution and, after a few hours, grow with distinct orientation. Debye-Scherrer X-ray diffraction patterns show that closed-packed hexagonal phase has appeared in body-centered cubic lattice. The orientation of the precipitates is analyzed by stereographic projection diagram which is drawn according to the knowledge from Laue spots. The new alpha-phase could be platelets parallel to {112} plane of the matrix. (N7; Mg, *Li*)

538-N. (Russian.) **Aging of the Al-Cu Alloy.** N. N. Buynov. *Fizika Metallov i Metallovedenie,* v. 1, no. 2, 1955, p. 339-348.

The Guinier-Preston zones 1 are present in the alloy immediately after hardening. During the process of low-temperature aging, the zones increase and become enriched with Cu, and the Guinier-Preston zones 1 become Guinier-Preston zones 2. The basic feature of artificial aging during the stage of vigorous strengthening of the alloy is the enrichment of the existing zones by Cu and their allotropic transformation into particles of the theta-prime phase.
(N7a, N6p; Al-Cu)

539-N. (Russian.) **X-Ray Diffraction and Electron-Microscope Investigation of Aging of an Al-Zn Alloy.** N. N. Buynov and L. I. Podrezov. *Fizika Metallov i Metallovedenie,* v. 1, no. 2, 1955, p. 349-358.

In the initial stage of aging, the Guinier-Preston zones hardly differ in structure from that of the matrix, are coherently connected with it, and are little saturated with the Zn atoms. Ths first stage of aging is significant in the enrichment of the zones with Zn. It leads to a distortion of the structure of the zones themselves and of the adjacent solid-solution regions, as evidenced by the asymmetry of the anomalous effects (diffused and linear) of the characteristic radiation. When the Zn concentration in the zones reaches almost 100%, the cubic lattice turns into the hexagonal lattice of Zn (second aging stage—separation).

542-N.* Formation of Ferrite and Pearlite in Cast Iron. G. Ohira and K. Ikawa. *Modern Castings,* v. 34, Oct. 1958, p. 60-66.

Formation of ferrite and pearlite studied in iron-carbon, iron-carbon-silicon alloys and charcoal pig iron. At the eutectoid temperature pearlite was nucleated by cementite which had precipitated on cooling after solidification; ferrite crystallized out on precipitated graphite. Pearlite formation was promoted when the Fe contained P or Sn. Ferrite formation was promoted by Mn. 5 ref. (N8h, N12; CI)

543-N.* Diffusion of Cadmium Into Single Crystals of Copper. Tokutaro Hirone, Nobuhiko Kunitomi, Masanobu Sakamoto and Hideo Yamaki. *Physical Society of Japan, Journal,* v. 13, Aug. 1958, p. 838-840.

Diffusivity measured in the range from 725 to 950° C. using radioactive isotope Cd^{115} as a tracer. Values obtained are compared with the corresponding values for the diffusion of Zn into Cu to investigate the effect of the difference in atomic radii.
(N1e, 1-59; Cu, *Cd,* 14-61)

544-N. Investigation of Germanium-Silicon Alloys. C. C. Wang. Sylvania Electric Products, Inc. *U. S. Office of Technical Services,* PB 131422, Feb. 1955, 50 p. $1.25.

Experimental methods for preparing homogeneous Ge-Si alloys in polycrystalline form for all the compositions and in single-crystal form for the low-Si alloys. Isothermal solidification technique used in preparing the alloys. From the standpoint of devices and ease of preparation, the most useful alloys are in the range between 0 to 15 at. % Si. (N12, N3r; Ge-b, *Si*)

545-N.* The Diffusion of Hydrogen in Steel at Temperatures of −78 to 200° C. J. D. Hobson. *Iron and Steel Institute, Journal,* v. 189, Aug. 1958, p. 315-321.

Using cylindrical specimens cut from large forgings, it is shown that diffusion of hydrogen in carbon and alloy steels does not follow predictions of accepted exponential equation at temperatures below 150° C. Diffusion constant at a given temperature varies with steel composition but square relating rate of evolution and specimen diameter is followed approximately. Results of experiments on large castings in agreement with laboratory measurements. 13 ref. (N1, 2-61; ST, *H*)

546-N.* Behavior of Nitrogen in 3% Silicon Iron. R. E. Fryxell, N. Galitzine and F. S. Gardner. *Iron and Steel Institute, Journal,* v. 189, Aug. 1958, p. 327-332.

Vacuum fusion method, hydrochloric acid evolution method and chemical separation followed by X-ray identification of inclusions were utilized in studying influence of quenching temperature, time of heat treatment and steel composition on reactions of nitrogen in 3% silicon iron. Results interpreted in terms of solution precipitation equilibrium of silicon nitride (Si_3N_4). Re-evaluation of chemical analysis methods. 21 ref. (N7, S11, 2-64; Fe, *Si*)

547-N.* (German.) **X-Ray Observations on Age Hardening Properties of Aluminum - Magnesium - Zinc Alloy.** Hermann Schmalzried and Volkmar Gerold. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 291-301.

Phases occurring during the age hardening process in an alloy with 6.5% Mg and 3.5% Zn. In the cold hardening phase at 135° C. a separation of Mg and Zn atoms takes place accumulating alternately in (001) planes of the crystals. The Mg atoms cause lattice distortion limiting the cluster diameter to about 25 Å. Above 80° C. the semistable intermediate phase $MgZn_2$ was observed in two orientations. Above 190° C. an additional stable ternary phase T ($Al_2Mg_3Zn_3$) appears. 29 ref. (N7a; Al-b, *Mg, Zn*)

548-N.* (Russian.) **Effect of Nickel Additions on Phase Transformations in Al-Cu Alloys During Long-Time High-Temperature Anneals.** A. Z. Zhmudskii and P. A. Maksimyuk. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 34-37. (Henry Brutcher, Altadena, Calif., Translation no. 4319.)

Investigation conducted by X-ray analysis and microhardness tests. Introduction of Ni retards the diffusion process in Al-Cu-Ni alloys at elevated temperatures. This slows down the aging process and grain growth thereby increasing the heat resistance of Al alloys. Maximum amount of Ni needed to inhibit decomposition is 1%. Addition of 0.5% Ni in Al-Cu-Ni alloys impedes grain growth during heat treatment. (N3, N1, N7a, 2-60, Al-b, *Ni*)

549-N.* (Russian.) **Grain Refinement on High-Temperature Heating.** Ya. R. Rauzin. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 14-17. (Henry Brutcher, Altadena, Calif., Translation no. 4314.)

Study of grain structure of metals when heated near melting point. Heating of 99.5% pure Al wire shows a continual grain growth. At 400° C. the average grain size is 0.12 mm.; at 600° C. it increases to 0.81 mm. As result of very slow increase of heat (5° per hr.) the average grain size slightly increases to 0.14 mm. at 400° C. and to 0.92 mm. at 600° C. Conclusions: there is no relation between grain refinement and phase transformation. Very slow heating, even to very high temperatures, does not lead to grain refinement. Quick heating at high temperatures results in localized plastic deformation and recrystallization resulting in considerable grain refinement. 10 ref. (N3, N5; Al-a)

550-N.* Preparation of FeO, NiO and CoO Crystals by Halide Decomposition. R. E. Cech and E. I. Alessandrini. *American Society for Metals, Transactions,* v. 51, Preprint no. 82, 1958, 8 p.

New method for producing crystals of FeO, NiO and CoO. Oxide crystals are produced by elevated-temperature decomposition of metal halide in an atmosphere which has

hydrogen and water vapor in the proper ratio to be in equilibrium with the monoxide phase of the metal. The metal halide decomposition occurs on an MgO crystal surface and deposits oxide in an epitaxially oriented film. Oxide crystal films 500 microns thick have been produced. 6 ref.
(N3r; Fe, Ni, Co, 14-68)

551-N.* Diffusion Layer Formation in the Ternary System Aluminum-Magnesium-Zinc. J. B. Clark and F. N. Rhines. *American Society for Metals, Transactions,* v. 51, Preprint no. 85, 1958, 19 p.

Identity, order and structure of ternary diffusion layers studied in couples composed of Al and a series of Mg-Zn alloys, using metallographic and X-ray diffraction methods. The sequence of layers always corresponds to consecutive regions in the appropriate ternary isotherm of the phase diagram; the composition path represented by successive compositions in the diffusion couple deviates away from that component which diffuses the most rapidly. 10 ref. (N1e, M24c; Al, Mg, Zn)

552-N.* The Mechanism of the Allotropic Transformation in High Purity Iron. Erwin Eichen and J. W. Spretnak. *American Society for Metals, Transactions,* v. 51, Preprint no. 89, 1958, 16 p.

Studied using a thermionic emission microscope. Criterion for discerning the difference between a nucleation and growth mechanism and a shear mechanism. Mechanism of the allotropic transformation in high-purity Fe just below the A_{e3} temperature is a shear mechanism. As the degree of undercooling increased, the average length of the individual shears increased, and the average rest periods between shears decreased. 8 ref. (N6p; Fe-a)

553-N.* The Effect of Stress on the Eutectoid Decomposition of Titanium-Chromium Alloys. A. W. Goldenstein, A. G. Metcalfe and W. Rostoker. *American Society for Metals, Transactions,* v. 51, Preprint no. 92, 1958, 18 p.

Three Ti-Cr alloys have been forged in the beta range to give six systems with controlled amounts of each phase. The isothermal transformation at 400, 500 and 600° C. of each of these systems was followed by resistivity, X-ray diffraction, elastic modulus measurements and metallography. The transformation study was repeated under a stress which produced creep in 1000 hr. An acceleration of 4 to 7 times in the rate of transformation occurred under the action of this stress. Complete tensile test data were obtained at all stages of the transformation and plotted on the T-T-T diagrams. 12 ref. (N7c; Ti, Cr)

554-N.* Austenite Transformation and Incubation in an Alloy Steel of Eutectoid Carbon Content. R. A. Grange, P. T. Kilhefner and T. P. Bittner. *American Society for Metals, Transactions,* v. 51, Preprint no. 93, 1958, 19 p.

Transformation of austenite as it occurs isothermally and on continuous cooling was studied in a Ni-Cr-Mo steel whose carbon content was such that neither pro-eutectoid ferrite nor pro-eutectoid carbide formed. Comparison of the resulting T-T-T diagrams reveals that the methods proposed for correlating the two are unsatisfactory for this steel. This is because holding metastable austenite in certain temperature ranges, whether accomplished by isothermal treatment or by comparatively slow continuous cooling retards subsequent transformation at a lower temperature. 13 ref.
(N8; AY, *Ni, Cr, Mo*)

555-N.* A Study of the Solidification Process in Grey and White Cast Irons. A. G. Fuller and I. C. H. Hughes. *British Cast Iron Research Association, Journal,* v. 7, Aug. 1958, p. 288-298.

Using the quenching technique and thermal analysis, the mode of eutectic solidification of 2-in. bar castings is studied for a white iron and a hyper-eutectic flake graphite iron. The white iron eutectic solidification by the progressive growth of columnar crystals, from the edge to the center of the casting, to form a continuously thickening, sharply defined shell of solid, while the center of the casting remained completely liquid. The hyper-eutectic gray iron eutectic solidified in a similar manner to that of a hypo-eutectic gray iron. 5 ref.
(N12q; CI)

556-N.* Recrystallization of Thorium. E. J. Boyle. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 217-224.

Pure Th, prepared by decomposition of the iodide, recrystallizes in the range from 500 to 700° C. after 20 to 80% reduction by cold rolling. Ames Th, prepared by calcium reduction of the fluoride, recrystallizes in the range from 520 to 700° C. after 20 to 80% reduction by cold rolling. Carbon, which is the principal contaminant in Ames Th, does not appear to have a significant effect on the recrystallization temperature range. (N5; Th)

557-N. Precipitation of Cu in Ge. Pt. 2. Supersaturation Effects. A. G. Tweet. *Physical Review,* v. 111, July 1, 1958, p. 57-66.

Evidence for the nucleation of Cu precipitates upon a single type of nucleation site in a supersaturated solid solution of Cu in essentially dislocation-free Ge. (N7; Cu, Ge)

558-N. Growth and Properties of "Whiskers". S. S. Brenner. *Science,* v. 128, Sept. 12, 1958, p. 569-575.

Further research is needed to show why crystal filaments are many times as strong as large crystals. 69 ref. (N3r)

559-N.* Solid State Graphitization in Iron-Carbon-Silicon Alloys. Ariel Taub. *Foundry,* v. 86, Oct. 1958, p. 82-83.

Graphite rosette nucleation and growth in a hypo-eutectic white cast iron. Presence of a dark etching layer that contained flake graphite was observed around the growing rosettes. The process of graphitization is pictured as occurring in two steps; the precipitation of secondary globular carbides from austenite and the decomposition of globular carbides into graphite and carbon-depleted austenite. (N8s; CI-p, *Si*)

560-N.* Analyses for Diffusion During Plastic Deformation. J. Simmons and J. E. Dorn. *Journal of Applied Physics,* v. 29, Sept. 1958, p. 1308-1313.

General equation for self-diffusion in deforming media. Methods of analyses for determining the self-diffusivity as a function of time for prescribed strain histories given for special cases of linear diffusion. No unrealistic assumptions relative to the constancy of the diffusivity with time are made. (N1b, Q24)

561-N.* Phase Transition in Solid Mercury. C. A. Swenson. *Physical Review,* v. 111, July 1, 1958, p. 82-91.

A polymorphic transition in solid mercury which was initially discovered by Bridgman has been studied at lower temperatures and pressures than those previously used. The transition would occur at zero pressure and 79° K. if these data are extrapolated. However, the transition begins to show time effects and large pressure hysteresis at much higher temperatures, and below 93° K. it can only be made to run irreversibly and in the alpha-beta direction, and then only upon the application of several thousand atm. pressure. (N6p; Hg)

562-N. (Bulgarian.) **X-Ray Study of Aging Lead-Tin Alloys.** L. N. Larikov. *Doklady Bolgarskoi Akademii Nauk,* v. 9, no. 4, 1956, p. 65-68.

Monocrystals of alloys containing 4.5, 6.0 and 19.0% Sn, were prepared by Czochralski's method, tempered after homogenizing from 182°, and aged at room temperature. A conversion of the monocrystal in the aging process into a polycrystalline aggregate was detected, and the effect of the composition of the alloy on the time of aging was established. Changes of lattice spacing of the solid solution in the aging process investigated by means of a special precision focusing camera. (N7; Pb, Sn)

563-N. (Czech.) **Structural Changes in Low-Carbon Low-Alloy Steels on Tempering.** Foldyna Voznyak. *Hutnické Listy;,* no. 11, 1956, p. 663-669.

Electron diffraction diagrams were taken from two steels with 0.08% C and 1.24% V (at an atomic ratio V:C of 3.62) and with 0.11% C and 2.25% Mo (with an atomic ratio Mo:C of 2.56) in the course of a 2-hr. anneal in the range 200-700° C. Specimens were first austenitized for 15 min. at 1250° C. and quenched into 10% NaOH. The precipitation of crystallographically developing special carbides (V_4C_3 and Mo_2C) causes the secondary hardness on annealing at temperatures of 450-600° C. (N8a, J29; AY)

564-N.* (French.) Study of the Nucleation of Graphite and the Kinetics of Graphitization of Prehardened White Cast Irons. Pt. 1. Pierre Laurent and Michel Ferry. *Fonderie,* June 1958, p. 249-262.

Influence of number of nodules of graphite in starting material on speed of graphitization during isothermal and two-stage malleabilizing; influence of a tempering opera-

tion prior to malleabilizing treatment on nucleation of graphite and speed of graphitization.
(N2, N8s, J23b; CI-p)

565-N. (Polish.) **Effect of Vibrations, Transformation of Retained Austenite to Martensite.** E. Smihorski. *Prace Instytutaw Ministerstwa,* v. 6, no. 19, 1957, p. 30-33.

Effect of mechanical ultrasonic and magnetostrictive vibrations on the microstructure of quenched steel containing 1.48% C, 0.70% Mn, 0.35% Si and 1.30% Cr. A particularly marked effect on the change of microstructure was shown by vibrations connected with magnetostriction, the effectiveness of which was greater than that of tempering at 210° C. Magnetostrictive vibrations bring about a reduction in the amount of retained austenite, the transformation of tetragonal martensite to cubic, and breakdown of the martensite needles. (N8p, 1-74; AY)

566-N. (Rumanian.) **Cooling Curves of Cast Iron With Spheroidal Graphite.** L. Sofroni. *Studii si Cercetari Metalurgie,* v. 1, no. 2, 1956, p. 241-259.

Character of the cooling curves of gray cast iron with 3.27% C, 2.96% Si and 0.193% P, and of cast irons with spheroidal graphite with 3.20 and 3.35% C, 3.15 and 2.65% Si, 0.221 and 0.060% P and 0.074 and 0.94% Mg. Eutectic conversion in the spheroidal graphite cast iron takes place with greater supercooling and in a smaller interval of time than in gray cast iron. Increase of the Mg and P content causes an increase in the degree of supercooling on eutectic conversion but C and Si decrease it and increase the duration of eutectic conversion, because they accentuate the extent of graphitization in the process of hardening.
(N8s; CI-n, CI-r)

567-N. (Russian.) **Crystal Structure of the Metastable Phase Forming on Tempering Cu-Sn Alloys With 24-27% Sn.** Yu. A. Bagaryatskii. *Kristallografiya,* v. 2, no. 2, 1957, p. 283-286.

Taking into account the structural factor and the repeatability factor, relative line densities were calculated for the phase in Cu-Sn alloys with structure similar to the hexagonal zeta phase in Ag-Zn alloys, and a comparison made with the experimental findings of X-ray structural analysis. It is shown that the tempering phase (zeta-phase) in Cu-Sn alloys is isomorphous with the zeta-phase of Ag-Zn alloys. The law for the lattice transition beta→zeta is similar to that for the transition beta→omega in Ti alloys.
(N6p, J29; Cu-b, *Sn*)

568-N. (Russian.) **Hardening of Austenite During Reverse Martensite Transformation.** V. N. Gridnev, V. T. Cherepin and N. F. Chernenko. *Metallovedenie i Obrabotka Metallov,* no. 5, 1957, p. 7-12.

An Fe-Ni-Mn alloy with 21.5% Ni, 2.86% Mn and 0.02% C, having an Ms temperature at about 10° and temperature of 470° C. for the beginning of the reverse martensite transformation, was studied to determine transformations at high rates of heating. Elongation, hardness, temperature, drop in voltage and current strength were measured. Heating was carried out at rates of 100-10,000° per sec. and the cyclic method of treatment was also used; soaking at −75° for 30 min., heating at 800° at a rate of 3000° per sec., and cooling in water. The magnitude of the volume effect during the reverse martensite transformation was the criterion of the stabilization of austenite. (N8p; AY)

569-N. (Russian.) **Some Rules for Direct and Reversed Martensitic Transformations.** E. L. Vinogradskaya and G. A. Kreslina. *Metallovedenie i Obrabotka Metallov,* no. 5, 1957, p. 12-15.

Conversions in an Fe alloy with 0.06% C, 13.2% Mn, 0.28% Cu, 2.12% Co were studied by a magnetometric method on a special apparatus. The amount of alpha-phase was determined. Temperature at the beginning of the formation of martensite was 110-113° C. Heating from −194° at a rate of 3° per min. to 680°, soaking 5 min., cooling at a rate of 3° per min. to −194°, heating to room temperature, etc., showed that the alpha-gamma transition occurs at 350-650° and that in the second cooling about half as much martensite is formed in comparison with the first heating. The greatest stabilization of the gamma-phase is observed on heating after the first cycle up to 630° (N8p; AY)

570-N. (Russian.) **Strain Hardening, Recrystallization and Softening of Al-**

loyed Austenite. L. A. Metashop and M. E. Blanter. *Metallovedenie i Obrabotka Metallov,* no. 5, 1957, p. 15-23.

Deformed specimens of an alloy steel with 1.0 to 1.2% C, 12% Mn, and additions of 0.98, 3.08 and 5.07% Cr were annealed at temperatures from ambient up to 1100° C., at intervals of 50-100° C. The processes of softening and recrystallization were assessed by measuring hardness and electrical resistance, as well as by metallographic examination and X-ray structural analyses. Softening of the austenite commences with a recovery process, and is completed at a low deformation degree (5%) only at the expense of the recovery process. Previous plastic deformation sharply lowers the temperature of the beginning of both the softening and recrystallization, and affects only slightly the end temperature of the softening process.
(N5, N7, 3-68; AY)

571-N. (Russian.) **Problem of the Nature of Martensitic Transformation.** M. E. Blanter and P. V. Novichkov. *Metallovedenie i Obrabotka Metallov,* no. 6, 1957, p. 11-14.

Changes in the condition of the retained austenite during martensitic transformation and the effect of these changes on its stability against forming further martensite particles. Specimens of steel with 1.21, 1.18 and 1.52% C and 2.04, 2.98 and 2.94% Mn respectively were heated to 860° C., cooled in oil and then, after various times, in the vapors from liquid O_2. The retained austenite content was determined on an anisometer. To obtain the characteristics of phase-work-hardening, a statistical method was used to measure the microhardness of the retained austenite. (N8p; AY, *Mn*)

572-N. (Russian.) **Effect of Vanadium on the Gamma→Alpha Transformation in Iron-Cobalt-Vanadium Alloys.** T. V. Krasnopevpeva and V. G. Livshits. *Sbornik Trudov (Tsentralny Nauchno-Issledovatelskii Institut Chernoj Metallurgii. Institut Stali),* no. 15, 1956, p. 68-85.

Investigation of transformation during continuous cooling of gamma-phase and also during isothermal holding on alloys with 0, 2, 4, 5, 8, 10 and 12% V, at a constant Co content of 51%. Coercive force measured and microstructure alloys examined. As the V content was increased from 0 to 12%, the temperature corresponding to the start of gamma → alpha transformation changed from 925 to 525° C.

573-N. (Russian.) **A Study of Transformation During Deformation of Iron - Cobalt - Vanadium Permanent Magnet Alloys.** G. V. Pshechenkova. *Sbornik Trudov (Tsentralny Nauchno-Issledovatelskii Institut Chernoj Metallurgii. Institut Stali),* no. 15, 1956, p. 111-123.

Transformation processes leading to high magnetic properties in alloys containing 5-18% V and 50-52% Co. Changes in saturation magnetization measured with an Akulov anisometer; electrical resistivity, hardness, microhardness and microstructural examination; dilatometric and in some cases X-ray analyses. A section of the equilibrium diagram was constructed for alloys with 50% Co and 8-13% V. Alloys containing less than 12% V have a gamma-phase structure and do not undergo much change on heating and cooling. (N6p, P16; Fe, Co, V, SGA-n)

574-N. (Russian.) **Problem of the Gamma-Phase Stability in N29K Alloy at Subzero Temperatures.** M. I. Yudkevich and N. A. Solov'eva. *Sbornik Trudov (Tsentralny Nauchno-Issledovatelskii Institut Chernoj Metallurgii, Institut Stali),* no. 15, 1955, p. 124-130.

Study of factors by which the gamma-alpha transformation can be brought down below −70° C. Specimens containing 26-32% Ni, 13-19% Co, 0.5-0.8% Cr and remainder Fe, were examined for the effect of alloy composition, cold work and heat treatment on the stability of gamma phase at temperatures below 0° C. Specific resistivity and coercive force were measured after annealing 1 hr. at 950° C. and after annealing and cooling for 2 hr. at −80° C. (N6p, 2-63; Ni, Fe)

575-N. (Russian.) **Recrystallization on Heating Eutectoid Aluminum Bronze.** G. N. Bogacheva and V. D. Sadovskii. *Trudnovoi Institut Fizicheskoi Metallurgii Ural Filial Akademii Nauk SSSR,* Series 17, 1956, p. 125-138.

Structural mechanism of recrystallization on heating specimens of Al bronze with 12.11% Al. The kinetics of the beta' beta-transformation on heating were examined dilatometrically on fully quenched samples. A comparatively rapid heating (200-300° C. per min.) does not lead to recrystallization, the grain showing great stability. The

phase transformation which starts, according to dilatometric curves, at 420° C., proceeds in the interior of the grains; this process of recrystallization is not accompanied by recrystallization of the solid beta-solution as involved by internal strain hardening on reverse transformation to "martensite". (N5; Cu-s, *Al*)

576-N. (Russian.) **Dilatometric and X-Ray Structural Analysis of Steels.** E. S. Tovpenets and G. N. Sin'kovskaya. *Trudy Donetskogo Industrialnogo Instituta,* v. 19, 1957, p. 59-64.

Effect of chemical composition, system of cooling and homogeneity of the steel on the decomposition of supercooled austenite in alloy construction steels containing C 0.32-0.42, Mn 0.40-0.72, Si 0.25-0.38, P 0.035, S 0.030-0.040, Cr 0.70-2.44, NiO 3.82, Mo 0-0.43, V 0-0.17 studied by dilatometric and X-ray structural analysis. The higher the alloy content, the lower is the temperature of beginning and end of decomposition of supercooled austenite. When degree of homogeneity of the steel decreases, the temperature of the end of decomposition of supercooled austenite is lowered to the region of lower temperatures. (N8; AY)

577-N. (Russian.) **Study of the Solubility of Carbides in Gamma Iron by Measuring the Width of the Diffraction Lines.** M. D. Perkas and A. E. Shamov. *Trudy Kuibeyshevskogo Inshener-Stroitelnogo Instituta,* Series 4, 1957, p. 177-183.

Investigations on low-carbon steel with 0.1% C, alloy steels with 6 to 11% Cr, 0.5% Ti, or 1.16% Cb, and on complex alloy steels with either 0.67% Ti and 5.7% Ni or 1.45% Cr and 0.83% V, or with 1.48% Mn and 1.4% V. To dissolve the carbides in the gamma phase, specimens were heated to 850-1300° C. and then quenched into a 10% aqueous solution of sodium hydroxide. X-ray diagrams were made in a back reflection camera with Cr-radiation. Relation between width of the diffraction lines and quenching temperature was obtained. (N8r, M22g; CN, AY)

578-N. (Russian.) **Low-Temperature Transformations in Austenitic Steels Used for Instrument Making.** F. A. Bogachev. *Trudy Leningradskogo Instituta Aviats ionnogo Priborostroeniya,* no. 22, 1957, p. 3-22.

Thermomagnetic and metallographic analysis used to study the effect of hot and cold plastic deformation, partial surface decarburization and isothermal holding at room temperature on martensitic transformation in thermomagnetic alloys (C 0.05-0.15%, Ni 30.8-37.0%, Mn 0.2-2.4%, Cr 10-12%), alloys with special thermal properties (C 0.05-0.30%, Ni 20.0-34%, Cr 2.3-2.8%, Co 5.7%) and thermo-bimetals (C to 0.36%, Ni 22.0-37.0%, Cr 2.0-3.0%). Review of the effects of ternary and quaternary alloying on the stability and properties of U-Zr, U-Cb and U-Mo gamma-phase alloys. Effects of ternary and quaternary additions of Cr, Mo, Cb, Ru, V and Zr, on transformation kinetics, transformation temperature, hot

hardness and corrosion resistance. 4 ref. (M24, 2-60; U-b)

582-N.* (German.) **On the Practical Application of TTT-Diagrams for Continuous Cooling of Heat Treated Steels.** Hans Bühler and Franz Josef Schmidt. *Stahl und Eisen,* v. 78, May 15, 1958, p. 663-668.

Forged specimens of 400-mm. diameter from steel 38 MnSi4 and steel of about 0.5% C and 0.25% Mo studied regarding their cooling behavior from austenite point in water and oil. Precalculation of diagrams according to T. F. Russel and H. Bachmann permits a sufficiently accurate means of determining cooling characteristics for pieces up to 500 mm. diameter. 12 ref. (N8g; ST)

583-N. Distribution of Small Quantities of Carbon in Alloyed Iron. A. S. Zavyalov and B. I. Bruk. *Academy of Sciences of the USSR, Proceedings,* v. 115, 1957, p. 667-670. (Translation by Consultants Bureau, Inc.)

Nature of distribution of carbon in alloyed iron studied by autoradiography using C^{14}. 8 ref. (N1e, 1-59; Fe)

584-N.* (Russian.) **Rhenium Recrystallization Diagram.** E. M. Savitskii, M. A. Tylkina and K. B. Povarova. *Doklady Akademii Nauk SSSR,* v. 119, Mar. 11, 1958, p. 274-277.

Recrystallization temperature for cast Re is lower than for the metallo-ceramic Re. Re does not have tendencies to sudden grain growth even at annealing temperatures as high as 2000 to 2500°. Grain diameters deformed by various degrees of compression higher than critical do not exceed 15 to 20 microns for metallo-ceramic Re and 100 microns for cast. High hardening property of Re calls for frequent intermediate annealing during cold treatment. (N5, 2-64, M27c; Re)

585-N. (Russian.) **Recrystallization Texture in Low-Carbon Steel After Cold Rolling.** K. V. Grigorov and G. P. Blokhin. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 331-338.

Magnetometric study. As the degree of deformation is increased, there are changes in both the type of recrystallization texture and the degreé of its perfection. For 90-95% deformation the first type of recrystallization texture, (001) [100] and (110) [001] is strongly developed. A second type of recrystallization texture is also present and becomes predominant on further increase of the degree of deformation. (N5, M26c; CN-g)

586-N. (Russian.) **Effect of Intermediate Annealing on Cold Rolling Texture and Recrystallization.** K. V. Grigorov and G. P. Blokhin. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 339-343.

Magnetometric study of effect of intermediate annealing at 800-1000° C. on the cold rolling texture and recrystallization of low-carbon and transformer steels. On cold rolling to high degrees of total deformation, with intermediate annealing, the texture formed is that characteristic of cold rolling to small degrees of deformation, without intermediate annealing. This indicates that it is possible to control the formation of cold rolling and recrystallization texture by selecting the number of intermediate anneals and degrees of deformation. (N5, M26c, 2-64; ST)

587-N.* Transformation Kinetics of Beta Plutonium. R. D. Nelson. *American Society for Metals. Transactions,* v. 51, Preprint no. 107, 1958, 6 p.

Transformation kinetics determined by a fluid displacement technique. Rate of formation of the alpha phase from the beta phase was determined after beta heat treating and allowing the sample to transform isothermally in the alpha range. Isothermal reaction curves were obtained from −78 to +90° C. A time-temperature-transformation curve showed the maximum rate of transformation to be approximately −20° C. A relationship between the fraction untransformed beta and the transformation temperature was established. 3 ref. (N6p, N7c; Pu)

588-N.* Recrystallization, Structure, and Hardness of Low Carbon Steels Containing up to 1% Copper. R. L. Rickett and W. C. Leslie. *American Society for Metals, Transactions,* v. 51, Preprint no. 108, 1958, 24 p.

Electron microscope and X-ray diffraction techniques were utilized in assessing effects of holding at 1100, 1200 and 1300° F. and Cu content on precipitation, hardness and lattice parameters of normalized Cu steels. Influence of recrystallization temperature, Cu content, cold

reduction and heat treatment prior to or following cold reduction on recrystallization rate, grain structure and hardness. Cu greatly retarded recrystallization and, in general, increased its hardness after annealing. Under proper conditions, comparatively coarse elongated ferrite grains were obtained in cold worked and annealed steels containing 0.4% or more Cu in which case the hardening effect of Cu was minimized. 6 ref. (N5, Q29n, 1-60; CN-g, *Cu*)

589-N.* **Solid State Diffusion and the Motion of Phase Boundaries.** David D. Van Horn. *American Society for Metals, Transactions*, v. 51, Preprint no. 116, 1958, 14 p.

Using the parabolic law for diffusion penetration versus time, the equations relating the motion of a phase boundary to the diffusion rates in a simple two-phase binary system are obtained. Nomographic methods for solving these equations are presented, and the behavior of various physical systems are analyzed. In cases where the parabolic law does not hold, the capabilities and limitations of various methods of analyzing the data are discussed. The influence of time dependent boundary conditions on the motion of phase boundaries is noted. Criteria for the design of experiments are given so that deviations from ideal behavior will be recognizable and the maximum physical significance may be obtained from the data. 19 ref. (N1b)

590-N.* (Russian.) **Changes in Some Properties of Steel No. EI612 and Its Dependence on the Degree of Austenite Decomposition.** V. I. Prosvirin and L. F. Chernov. *Metallovedenie i Obrabotka Metallov*, June, 1958, p. 10-14. (Henry Brutcher, Altadena, Calif., Translation no. 4246.)

This Cr-Ni steel containing W, Ti and Al was heat treated at different temperatures for various time intervals. Brittleness was produced at all temperatures after the first 1-2 hr. Intensive lowering of shock resistance resulting from heating at comparatively high temperatures is raised by longer treatment at 750° C. $Ni_3(AlTi)$ and TiC appear as secondary phases. The lower the temperature of austenite decomposition the more noticeable the changes in properties.

596-N. (Russian.) **Investigation of Iron-Cobalt Alloys With High Magnetic Saturation.** G. V. Pshechenkova and T. V. Krasnopevtseva. *Sbornik Trudov (Tsentralny Nauchno-Issledovatelskii Institut Chernoj Metallurgii Institut Stali)*, v. 15, 1956, p. 102-110.

Hardness, microstructure, critical points and magnetic properties of alloys containing 50% Co and 2% V. V substantially alters the critical points of alloys of the system Fe-Co, lowering the temperature of the alpha $\rightleftharpoons$ gamma change. The microstructure of slowly cooled alloys exhibits a characteristic network in the grains, which is probably associated with the phenomenon of order formation. The hardness of cold rolled specimens substantialy increases on heating up to 400-600°; with further temperature increase there is a decrease in hardness which is associated with the beginning of recrystallization.

598-N. (Ukrainian.) **Relationship Between Chemical Composition and Alpha-Phase Content.** I. M. Fishman. *Naukovi Zapiski (Zaporiz'kii Derzhovnii Pedagogichnii Institut)*, v. 2, 1956, p. 79-82.

From tests on 400 casts of steel 1KH18N9T, an empirical formula was obtained by statistical analysis, giving the alpha-phase content for any actual steel composition within specification limits. Calculation was based on the multiple correlation method, assuming that Si, Cr and Ti increase the alpha-phase content, while C, Mn and Ni decrease it, to varying degrees. The formula obtained is as follows: alpha = − 10.47 C + 1.00 Si − 0.11 Mn + 0.50 Cr − 0.28 Ni + 1.63 Ti − 4.73. The over-all correlation coefficient is 0.434, showing that results are quite trustworthy. (N8, 2-60; AY, SS)

601-N. Effect of Composition on the Ms and Decomposition Temperatures in Stainless Steels. F. C. Monkman, F. B. Cuff and N. J. Grant. Massachusetts Institute of Technology. *U. S. Office of Technical Services*, PB 125891, 18 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.40; Photostats $3.30.)

Martensite reaction is followed in simple 18-8 stainless steels by electrical resistivity. A linear equation is determined by the method of least squares relating the alloy composition and the temperature at which martensite is first observed to form during cooling. Decomposition of martensite at elevated temperatures investigated by electric resistivity measurements; decomposition products examined metallographically. (N8p, 2-60; SS)

602-N. Influence of Oxygen on the Transformation Characteristics of Some Titanium-Molybdenum Alloys. George L. Kehl and Alfred E. Riccardo. Columbia University School of Mines. *U. S. Office of Technical Services*, PB 125957, Oct. 1955, 83 p. (Available at Library of Congress, Washington, D. C.—Microfilm $4.80; Photostats $13.80.)

Influence of dissolved oxygen in the Ti-Mo alloys investigated was to shorten the time for initiation and completion of isothermal transformation and to raise the region of

rapid transformation of the T-T-T curve to higher temperature levels. (N7c; Ti-b, *Mo*)

603-N. Self-Diffusion in Germanium. Harry Letaw, Jr., W. M. Portnoy and L. Slifkin. Illinois Engineering Experiment Station. *U. S. Office of Technical Services,* PB 125958, May 1956, 15 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.40; Photostats $3.30.)

In the temperature range 766-928° C., self-diffusion coefficient of Ge is represented by D-7.8 exp (−68,500/RT) sq. cm. per sec. The probable errors in the frequency factor and activation energy are ± 3.4 sq. cm. per sec. and ± 0.96 k. cal. per mol., respectively. (N1d; Ge)

604-N. Transformation in Disordered Gold Copper Alloys. G. C. Kuczynski, M. Doyama and M. E. Fine. Northwestern University. *U. S. Office of Technical Services,* PB 126302, Mar. 1956, 21 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.70; Photostats $4.80.)

Measurement of specific heat, temperature coefficient of expansion, Young's modulus and yield point in Cu_3Au alloys establishes a phase transition between 550 and 600° C. and possibly another one near 850° C. The temperature of the 550-600° C. transition decreases sharply as the composition of the alloy deviates from Cu_3Au. (N10a; Cu, Au)

605-N. Investigation of Beta Phase "Recrystallization" in Ti-3%Al-5% Cr Alloy. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131338, Nov. 1957, 22 p. $.75.

Possibility of controlling beta grain size during heat treatment of binary and ternary Ti alloys with Al and Cr, and effects on mechanical properties. Beta grain behavior was studied in the composition ranges of commercial MST Ti-3Al-5Cr alloy. A preliminary transformation temperature survey was made. (N5, M27c, 2-63; Ti-b, *Al, Cr*)

606-N. Research on the Effects of Stress, Strain, and Temperature on the Eutectoid Decomposition of Titanium Alloys. Adolph W. Goldstein, Arthur G. Metcalfe and William Rostoker. Armour Research Foundation. *U. S. Office of Technical Services,* PB 131610, Nov. 1957, 72 p. $2.

Three Ti-Cr alloys were forged in the alpha-beta range to give six systems with controlled amounts of each phase. The isothermal transformation at 400, 500 and 600° C. of each system was followed by resistivity, X-ray diffraction, elastic modulus measurements and metallography. Reactions occurring in the transformation were identified where possible. This transformation study was repeated under a stress which produced 1% creep in 1000 hr. An acceleration of four to seven times in the rate of transformation occurred under the action of this stress. (N9, N7c; Ti)

607-N.* (German.) **Structures Resulting From Precipitation of Cementite in Ferrite.** Wolfgang Pitsch and Angelica Schrader. *Archiv für das Eisenhüttenwesen,* v. 29, Aug. 1958, p. 485-488.

Investigations on the similarity in orientation of ferrite and cementite particles which have been precipitated from the ferrite. Direct electron microscope pictures of particles and electron diffraction pictures. Similarity in the atom structure suggests preference for $[111]_\alpha$ and $[010]_\alpha$ planes. 6 ref. (N8j; ST)

608-N.* (German.) **X-Ray Examination of Stacking Defects in Cold Formed Alpha-Iron.** Christian N. J. Wagner. *Archiv für das Eisenhüttenwesen,* v. 29, Aug. 1958, p. 489-493.

Chips from pure alpha iron were produced at room temperature under liquid nitrogen. Position and form of the intensity distribution diagrams of various Debye-Scherrer-lines were measured with filtered Co and Mo rays and with a Norelco diffractometer. A line spread was observed after cold deformation but no line shift. The particle spread is dependent on the crystallographic orientation and can be explained through stacking defects in the (211) planes of the lattice structure. 24 ref. (N8j; M22g; Fe)

609-N.* (German.) **Grain Size in the Hardening of Gold-Platinum Alloys.** H. Schmid. *Metall,* v. 12, July 1958, p. 612-619.

Gold-platinum alloys with 50 to 75% Au and 25 to 49% Pt tend to have strong grain segregation which increases up to 50% Pt and which is still in existence after 14th annealing at 1000° C. Rh additions have no effect on this phenomenon. Pt-rich alloys have finer grains than those with low Pt content. Grain

grows with increasing homogeneity of castings. Alloys between 30 and 50% Pt show better hardenability without Rh. Phase diagrams are given, and diagrams for strain, tensile strength, hardness as a function of annealing time and per cent Pt. 15 ref. (N3, J23; Au, Pt)

610-N.* (German.) **Structural Transformations of Austenitic Steels Subject to Long-Time Strain Tests.** Walter Koch, Angelica Schrader, Alfred Krisch and Helga Rohde. *Stahl und Eisen,* v. 78, Sept. 4, 1958, p. 1251-2162.

Four Cr-Ni steels, two of which were Cb-stabilized and one of which contained approx. 2% Mo, were subjected to long-time stress of 0 to 40 kg. per sq. mm. at 600-700° C., and up to 50,000 hr. Under these conditions, initially the MeC carbide of the stabilizing element was precipitated. Later the $Me_{23}C_6$ carbide was reduced again after a certain time and disappeared with the formation of the sigma phase. 15 ref. (N8, 3-68; AY)

611-N.* (Russian.) **Effect of Nitrogen on Austenite Grain Growth of Medium-Carbon High-Phosphorus Steel.** V. N. Svechnkov and I. Kh. Truzh. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 15-19. (Henry Brutcher, Altadena, Calif., Translation no. 4350.)

Combined effect of increased phosphorus-nitrogen content on grain size of medium carbon steel and changes occasioned by increased temperature. Tests conducted with bessemer rail steel (0.07% P). Results of metallographic study show that steels with 0.025% N show numerous clearly defined deformation lines in the ferrite. They are also present in steels with 0.006% N, but in considerably fewer numbers. Introduction of Al reduces number of these deformation lines. With 0.4% Al an agglomeration of these lines is noted. 13 ref. (N3, 2-60; CN)

612-N.* (Russian.) **Transformations During Heating of Quenched White Iron.** F. K. Tkachenko and V. F. Zubarev. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 24-26. (Henry Brutcher, Altadena, Calif., Translation no. 4352.)

Study made by simultaneous recording of thermal, dilatometric and magnetic curves during heating and cooling of specimens. Objects were heated with 800, 900, 950 and 1000° temperatures at 30-min. exposures. The magnetic transformation taking place in the ferrite of white iron goes below the Ac_1 point. At the second temperature levels the residual austenite is transformed into martensite and the magnetic transformation of carbides of unknown composition. (N8; CI-p)

613-N.* **Interaction of Dislocation With Atomic Order in Solid Solutions.** Koji Sumino. *Tohoku University, Science Reports of the Research Institutes,* v. 10, Aug. 1958, p. 283-298.

Interaction energy and locking force against the motion of the dislocation are calculated for the superlattice of a beta-brass type alloy; effect of thermal motion on the locking force. Interaction energy and locking force for an edge dislocation reveal a sharp peak at the Curie point of order-disorder transformation, while such a sharp peak is absent in a screw dislocation. (N10, M26b; Cu-b)

614-N.* **Diffusion of Calcium in Liquid Slags.** Tunezo Saito and Kazuo Maruya. *Tohoku University, Science Reports of the Research Institutes,* v. 10, Aug. 1958, p. 306-314.

Self-diffusion coefficients of Ca in molten slags (CaO-SiO_2, CaO-Al_2O_3, and CaO-SiO_2-Al_2O_3-MgO systems) were measured in the temperature range from 1350 to 1600° C. Diffusion coefficient has good correspondence to both the specific electric conductivity and the viscosity coefficient. Some behaviors of Al_2O_3 and MgO in basic slags. (N1d; RM-q, Ca)

615-N. Irradiation Induced Phase Changes in Uranium-Base Alloys. M. L. Bleiberg. Second United Nations Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/619, 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Kinetics of the phase reversal were studied by continuous measurements of the electrical resistivity of U alloy with 9% Mo while under pile-irradiation and at low temperatures. Changes in temperature coefficient of electrical resistivity were measured as a function of exposure. 10 ref. (N6p, 2-67; U-b, *Mo*)

616-N. Transformation Kinetics of Plutonium. R. D. Nelson and I. D. Thomas. Second United Nations International Conference on the

Peaceful Uses of Atomic Energy. A/CONF.15/P/1030, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Alpha → beta, beta → gamma and gamma → delta transformations in Pu studied by fluid displacement measurements. Heating and cooling curves, isothermal reaction curves showing the fraction transformed as a function of time, T-T-T curves, were obtained by this technique. (N6p; Pu)

617-N.* (French.) **Study of the Nucleation of Graphite and the Kinetics of Graphitization in Prehardened White Cast Irons. Pt. 2.** Pierre Laurent and Michel Ferry. *Fonderie,* no. 150, July 1958, p. 319-337.

Graphitization at temperature lower than that of eutectoid transformation point: number of particles of graphite obtained by isothermal treatment, speed of graphitization between 500 and 700° C., relationship between number of nuclei and speed of graphitization, variations in Vickers hardness during isothermal transformation, incubation period. Also, comparative study of kinetics of graphitization of hardened and nonhardened irons. (To be continued.) (N2, N8s; CI-p)

618-N.* (French.) **Iron Containing Diffused Graphite Produced by Annealing. Physicochemical and Metallographic Aspects.** J. Pomey. *Revue Universelle des Mines,* v. 14, 9th Series, Sept. 1958, p. 293-300.

Formation and evolution of transition carbides from martensite or bainite; epitaxic germination of graphite from hexagonal carbide; morphological and kinetic aspects of growth of graphite. Heat treatment of iron containing diffused graphite; mechanical properties of this iron. (N8s, J23: CI)

619-N.* (German.) **Strain Aging of Soft Iron Retarded by Phosphorus.** Friedrich Erdmann-Jesnitzer and Willi Dehnke. *Bergakademie,* v. 10, May-June 1958, p. 321-327.

Samples from melts with 0.02-0.07% C, 0.01% Si, 0.08-0.12% Mn, 0.006-0.073% P, 0.021-0.022% S, 0.013-0.014% N and 0.011-0.014% O were rolled and tested. Strain aging tendency studied by determination of elastic limit and increase of hardness after pre-straining and aging. Strain aging decreases within the range of 0.006 to 0.073% P. 15 ref. (N7e, 2-60; Fe, *P*)

620-N.* (German.) **Recrystallization of Magnesium in the Presence of Trace Elements.** Friedrich Erdmann-Jesnitzer and Ingrid Otto. *Bergakademie,* v. 10, May-June 1958, p. 328-333.

Experiments on the recrystallization temperature in relief annealing. Two Mg samples (with 0.08 wt % = 0.07 at. % and 0.44 wt. % = 0.40 at. % Al) and two other samples (with 0.08 wt. % = 0.035 at. % and 0.95 wt. % = 0.40 at. % Fe) were deformed by rolling and relief annealed. The recrystallization temperature was shifted to higher values by the added elements, especially by irons. 63 ref. (N5f, 2-60, 2-61, 2-64, 3-68; Mg-f, *Fe*)

621-N.* (Swedish.) **Strain Aging of High-Carbon Steels.** *Jernkontorets Annaler,* v. 142, no. 8, 1958, p. 515-535.

Mechanism governing improvement in elastic properties of high-carbon steels during annealing in the temperature range 150-300° C. Aging occurred in comparison with mild steel only after a considerable time delay, which increases with carbon content, particularly at more than 0.6-1.0% C. A suggested explanation of this delay is that those dislocations first to acquire a solute atmosphere would not have contributed to further slip, whether pinned or not. Solute pinning is considered to develop first at pile-up with large stress fields. 39 ref. (N7e, CN-r)

622-N.* (Russian.) **Polygonization of Cast Metals and Alloys.** B. A. Movchan. *Doklady Akademii Nauk SSSR,* v. 120, no. 3, 1958, p. 521-522.

Pure Cu and Ni test pieces vacuum cast and examined by microscope for structure changes. Micrographs of steels Kh25N20 and Kh8N13 and of the alloy Ni + 0.62 Cb. Structure change thought to be a consequence of boundary dislocations taking place in cooling. 5 ref. (N5; Cu, Ni, 5-60)

623-N.* (Russian.) **Influence of Small Additions on Diffusion Coefficients in Polycrystalline Metals. Pt. 2.** V. I. Arkharov, S. M. Klotsman and A. N. Timofeev. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 255-260.

Radiometric investigation of influence of 0.1% Be on intercrystalline diffusion of Ag in polycrystalline Cu. In alloys with Be the coefficient of intercrystalline diffusion of Ag is higher than in pure Cu. Hence, the volume of change of this coefficient is dependent on

the preliminary treatment of the alloy. Conclusions as to the adsorbtive activity of Be in Cu and dependence of the concentration of Be in intercrystalline transitional zones on temperature. 13 ref.
N1, 2-60, 2-61; Ag, *Be*, Cu)

624-N.* (Russian.) **Spheroidization of Graphite in Iron Treated With Magnesium.** A. Ya. Khronov. *Fizika Metallov i Metallovedenie*, v. 6, no. 2, 1958, p. 281-288.

The form of graphite in magnesium iron is closely related to the surface tension. The higher the surface tension the more compact the form of graphite. The decisive influence in the process of spheroidization of graphite is the supercooling of the iron. Studies were made on influence of addition of metallic Mg on surface tension of iron and form of precipitation of graphite. Iron was melted in Kryptol electric furnace with magnesite lining and capacity of 800 g. 31 ref.

652-N. Grain Growth in Zone-Refined Lead. G. F. Bolling and W. C. Weingard. *Acta Metallurgica,* v. 6, Apr. 1958, p. 283-287.

A single growth law was observed whose departure from a simple $t^{1/2}$ relation could be explained on the basis of an inclusion-type hypothesis following Burke. 13 ref. (N3, 2-60; Pb)

653-N. Some Effects of Impurities on Grain Growth in Zone-Refined Lead. G. F. Bolling and W. C. Weingard. *Acta Metallurgica,* v. 6, Apr. 1958, p. 288-292.

In general, grain growth was retarded to an increasing extent from Sn to Ag to Au but the rates of grain growth at any time approached a common value near the melting point for all the purities investigated. 4 ref. (N3, 3-69; Pb)

654-N. Structural Changes in Single Crystal Copper-Alpha Brass Diffusion Couples. V. Y. Doo and R. W. Balluffi. *Acta Metallurgica,* v. 6, June 1958, p. 428-438.

Changes associated with Kirkendall diffusion include dislocations; arrangement of dislocations into subboundaries; recrystallization; twinning. Effect of temperature. 18 ref. (N1a, M26b, Cu, Cu-b, 2-61)

655-N. An X-Ray Examination of the Epsilon Phase in TiV, TiMo and TiCr Alloys. J. M. Silcock. *Acta Metallurgica,* v. 6, July 1958, p. 481-493.

Alloys of Ti with 16% V, 13% Mo or 13% Cr, all from an epsilon phase of same structure. This phase can be reverted and retarded by cold work. Cold work also accelerates formation of alpha phase. 15 ref. (N6p; Ti, *V, Mo,* Cr, 3-68)

656-N. Slow Strain-Hardening of Ingot Iron. A. W. Sleeswyk. *Acta Metallurgica,* v. 6, Sept. 1958, p. 598-603.

Strain-hardening characteristics of Armco ingot iron during slow plastic deformation under tension. The serrated stress-strain curves often observed with this type of material are a consequence of the anomalous velocity dependence of strain-hardening. A modification is proposed of the Nabarro theory of blue brittleness. 20 ref. (N7e, Q24, Q25n, 3-68; Fe-a)

657-N. Diffusion of Carbon and Oxygen in Vanadium. *Acta Metallurgica,* v. 6, Oct. 1958, p. 643-646.

Carbon diffuses faster than oxygen. Solutions of C in V are unstable, however, due to precipitation of VC. 10 ref. (N1a; V, *C, O*)

658-N. Precipitation of Silicon Out of a Supersaturated Aluminum-Silicon Solid Solution. H. S. Rosenbaum and D. Turnbill. *Acta Metallurgica,* v. 6, Oct. 1958, p. 653-659.

Precipitation of Si from Al (1% Si) solid solution strongly dependent on previous heat treatments. 12 ref. (N7b, 2-64, 3-70; Al, Si, 14-67)

659-N. Role of Dislocations in Carbide Precipitation in Alpha-Iron. R. H. Doremus. *Acta Metallurgica,* v. 6, Nov. 1958, p. 675-679.

Under increased strain, rate of precipitation of carbon from alpha-iron increased. Concluded that car-

bon precipitation occurs by nucleation of carbide particles on dislocations. 18 ref. (N7b; Fe, C, 3-68)

660-N. Martensitic Transformations and Determination of the Inhomogeneous Deformation. D. S. Lieberman. *Acta Metallurgica,* v. 6, Nov. 1958, p. 680-693.

Simple, graphical method for determining, directly from observations of crystallographic features of a martensite transformation, the inhomogeneous deformation. 25 ref. (N8p, Q24)

661-N. Liquid Immiscibility in Copper-Iron and Copper-Cobalt Systems in the Supercooled State. Y. Nakagawa. *Acta Metallurgica,* v. 6, Nov. 1958, p. 704-711.

Liquid immiscibility found only in super-cooled state. Results related to thermodynamics of the liquid solutions. 10 ref.

24-P. Freezing Points of High Purity Metals as Precision Temperature Standards. Pt. 2. Investigation of the Freezing Temperatures of Zinc, Cadmium and Tin. E. H. McLaren. *Canadian Journal of Physics,* v. 35, Sept. 1957, p. 1086-1105.

An investigation with Pt resistance thermometry. Plateaus of essentially constant ($<\pm 0.0001°$ C.) temperature with durations of over 1 hr. are readily obtained on the cooling curves of these metals. For series of freezes on particular samples, the standard deviations of the respective plateau temperatures were of the order of $\pm 0.0002°$ C. Pressure effects on the freezing temperatures were 0.0043° C., 0.0062° C., and 0.0033° C. per atmosphere for Zn, Cd and Sn; respectively. Thermal analysis of these high-purity metals reveals structures and other features associated with nucleation, coring and annealing phenomena; typical thermal curves are shown. 14 ref. 25-P.* **Reaction of Hydrogen With Preoxidized Zircaloy—2 at 300 to 400° C.** Earl A. Gulbransen and Kenneth F. Andrew. *Electrochemical Society, Journal,* v. 104, Dec. 1957, p. 709-712.

The permeability of preformed oxide films to hydrogen at 300-400° C. was studied. Two types of reactions were observed. If the oxide film was permeable, a general reaction occurred with the formation of zirconium hydride phases on the surface. If the oxide film was relatively impermeable, reaction occurred at the edges of the sample where defects probably exist in the oxide. 7 ref. (P10m, N15d; Zr, *O*)

26-P. A Metallurgist's View of Metallurgy. Earle E. Schumacher. *Metallurgia,* v. 56, Sept. 1957, p. 129-133.

Research and progress in understanding solid state including plastic flow, atomic scale defects, magnetic properties and low-temperature phenomena.
(P general, N general, Q general)

27-P. Low-Temperature Galvanomagnetic Effects in Bismuth Monocrystals. R. A. Connell and J. A. Marcus. *Physical Review,* v. 107, Second Series, Aug. 15, 1957, p. 940-946.

Measurements of the Hall coefficient and magnetoresistance have been made on Bi monocrystals at liquid He temperatures in range from 3 to 16 kilogauss for all principal crystallographic orienta-

tions. Two complete sets of oriented crystals were used, one set grown from unpurified Bi, the other from zone-refined Bi. Pronounced de Haas-van Alphen type oscillations were observed with same periods for both galvanomagnetic effects. For a given orientation of magnetic field with respect to crystal axes, periods were in good agreement with the values found in de Haas-van Alphen effect and were independent of current direction. Impurities were found to have little effect on the period but a large effect on the amplitude of oscillations and on monotonic component of both magnetoresistance and Hall effect. 16 ref. (P16, 2-63; Bi, 14-61)

28-P. De Haas-van Alphen Oscillations in the Thermal and Electrical Magnetoresistance of Tin. Perry B. Alers. *Physical Review,* v. 107, Aug. 15, 1957, p. 959-960.

Oscillatory behavior of the de Haas-van Alphen type has been found in both the electrical and thermal magnetoresistance of an Sn single crystal at liquid He temperatures. Measurements were made in magnetic fields ranging from 22 to 25 kilogauss. Tetragonal axis of the crystal was parallel to the field and perpendicular to rod axis. Thermal and electrical oscillations were in phase and yielded values in substantial agreement with that deduced by Shoenberg from diamagnetic susceptibility requirements. 5 ref. (P16; Sn, 14-61)

29-P. Oscillatory Galvanomagnetic Properties of Bismuth Single Crystals in Longitudinal Magnetic Fields. Julius Babiskin. *Physical Review,* v. 107, Second Series, Aug. 15, 1957, p. 981-992.

Galvanomagnetic effects of oriented single crystals of Bi have been studied in longitudinal magnetic fields up to 60,000 gauss at liquid helium temperatures. Oscillatory behaviors with de Hass-van Alphen periodicity were discovered to be superimposed upon the normal galvanomagnetic effects. 48 ref. (P16; Bi, 14-61)

30-P. Processes Occurring During the Heat Treatment of Alcomax. A. G. Clegg and M. McCaig. *Physical Society Proceedings,* Section B, v. 70, Sept. 1, 1957, p. 817-822.

The permanent magnet alloy Alcomax has been investigated after different heat treatments using two techniques. Curves of saturation intensity against temperature have been obtained using a Sucksmith balance, and curves of coercivity against temperature by extraction from a solenoid. It is concluded that maxima in the coercivity curves are associated with subsidiary Curie points. Reversible changes in room temperature coercivity produced between 600 and 700° C. are also associated with the appearance and disappearance of subsidiary Curie points. 12 ref. (P16d, 2-64; Al)

31-P. Unusual Magnetic Properties of Quenched Alcomax III. M. McCaig. *Physical Society Proceedings,* Section B, v. 70, Sept. 1, 1957, p. 823-826.

If the permanent magnet alloy Alcomax III is quenched from a high temperature instead of the usual treatment it has the properties of a rather unusual soft magnetic material. The permeability is almost constant up to flux densities over 5000 gauss and the ratio of remanence to saturation intensity is less than 0.1. Details of these properties and their theoretical implications. 3 ref. (P16d, 2-64; Al)

32-P. Temperature Coefficient of Reflectivity of Nickel. L. Ward. *Physical Society Proceedings,* Section B, v. 70, Sept. 1, 1957, p. 862-866.

The variation with temperature of reflecting power of Ni has been measured by null method at five wavelengths in the near infrared region of the spectrum. Results are in satisfactory agreement with those calculated from previous work on emissivity. There was no conclusive evidence for significant change in reflectivity at the Curie point. (P17f; Ni)

33-P. Secondary Electron Emission From Nickel and Molybdenum at Low Primary Electron Energies. A. R. Shulman and E. I. Miaakinin. *Soviet Physics-Technical Physics,* v. 1, no. 10, 1957, p. 2157-2166. (CMA) (Translated by American Institute of Physics.)

Mass spectrometric analysis of the vapor in thermodynamic equilibrium with mixtures of Ta (s) and Ta_2O_5 (s) has shown TaO and TaO_2 to be the predominant gaseous molecules present. The experimental data yield 8.4 ± 0.5 ev. and 15.0 ± 0.5 ev. for the energies of atomization of these molecules at 0° K. 18 ref. (P12; Ta, *O*)

36-P. Is Cobalt Harmful in Stainless Steel? Joseph R. Lane. *Metal Progress,* v. 72, Dec. 1957, p. 86-87.

In certain nuclear applications where neutron absorption converts the element into Co-60, stainless steels containing Co could become dangerous radiation sources. (P18h, 2-60; SS, Co, 2-67)

37-P* An Investigation Into the Effect of Magnetic Domains in Cobalt on an Electron Beam. M. Blackman and E. Grunbaum. *Royal Society Proceedings, Series A, Mathematical and Physical Sciences,* v. 241, Sept. 10, 1957, p. 508-521.

The effect on an electron beam of the leakage field due to the magnetic domains in an unmagnetized crystal of hexagonal Co has been investigated. A conventional electron-diffraction camera was used, the primary beam being limited by a small movable aperture and the deflexions observed on a photographic plate. Both the hexagonal and prism faces were examined. Magnetic effects were found (a) on the primary beam, (b) on the diffraction pattern, (c) on the shadow edge of the diffraction pattern, and (d) on the shadow photograph of the crystal produced by diffuse scattering from the edge of the aperture. These effects are analyzed in terms of the fields produced by the magnetic domains; measurements are made of the size of the domains and of the magnitude of the leakage field at the surface and its variation with the distance from the surface. 10 ref. 101-P.* **Viscosity of Lead, Tin and Their Alloys.** W. R. D. Jones and J. B. Davies. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 164-166.

The decrease of viscosity with increase of temperature is uniform, and the relationship between viscosity and temperature is that expected from Andrade's equation, except near the freezing point, where there is a deviation and viscosity increases rapidly. There are marked changes in the slope of the viscosity-composition curves at alloy contents corresponding to changes in constitution. 9 ref. (P10f; Pb, Sn)

102-P.* **Electron Irradiation of Copper Near 10° K.** J. W. Corbett, J. M. Denney, M. D. Fiske and R. M. Walker. *Physical Review,* v. 108, Nov. 15, 1957, p. 954-964.

The resistivity change induced by electron irradiation of zone-refined Cu maintained at ~10° K. has been measured over the range of bombarding electron energies from 0.70 to 1.37 Mev. The cross section for damage production is shown to be insensitive to the choice of the shape of the displacement probability function for this energy range. Isochronal and isothermal annealing studies of irradiations performed at 1.37 Mev. are described. The isothermal annealing curves are not amenable to analysis in terms of a single simple rate process, but seem to require a multiplicity of processes. 24 ref. (P15g, P18j, 2-67; Cu)

103-P.* **Differential Cross Section for 3.8 Mev. Neutrons Scattered From Zirconium and Molybdenum.** H. S. Hans and S. C. Snowdon. *Physical Review,* v. 108, Nov. 15, 1957, p. 1028-1031.

The differential cross sections for the scattering of 3.7-Mev. neutrons from Zr and Mo have been measured

in a ring geometry by using a Bonner-type scintillation detector. The measurements were taken over an angular range of 124° between 18° and 142°. Angular resolution effects have been removed by iteration. Multiple scattering effects have been removed by a Monte Carlo-type calculation. 12 ref.

110-P.* (French.) Effects of Radiation on the Physical Properties of Metals. J. Goens. *Revue de la Mécanique,* v. 3, Oct. 1957, p. 140-152.

Radiation can damage reactor components by three different mechanisms: interaction of products of fission with atoms of crystal lattice of the nuclear fuel; elastic collisions of neutrons with atoms of a crystal lattice; effects of ionization due to products of fission, to atoms displaced in lattices, and to beta and gamma rays. These mechanisms cause structural defects affecting properties of parts subjected to radiation, causing appearance of vacancies and interstitial atoms, of thermal spikes, and of atoms of chemical types not originally present in crystal, and modifying bonds between atoms of the lattice. Mechanical and physical properties of structural materials are greatly modified and fissionable metals, in some cases, undergo considerable change in dimension. Reactor permitting study of above phenomena is being designed for Belgian Center for Nuclear Studies. (P general, Q general, M25, 2-67)

Free enthalpy values; influence of pH on solubility of Sb_2O_3 and Sb_2O_5; theoretical conditions of corrosion, immunity and passivation of antimony. Diagram was used to study general conditions of corrosion and noncorrosion of the metal, and operating conditions of two types of Sb electrodes. 34 ref.
(P15, P12r, R10c; Sb)

138-P.* (French.) **On the Evolution of the Electrical Resistance of Zone-Melted Cold Worked Aluminum During Annealing at −79° C.** Omourtague Dimitrov and Philippe Albert. *Comptes Rendus,* v. 245, Dec. 16, 1957, p. 2275-2277.

A technique was developed for rolling of Al in liquid nitrogen. Specimens thus cold worked, others cold worked at room temperature and placed at once at temperature of liquid nitrogen, plus others cold worked at −18° C., were then annealed at −79° C. and evolution of electrical resistance was measured. Al cold worked in liquid nitrogen developed resistance faster and in greater magnitude than other specimens, and recrystallized completely after 200 hr. at −52° C.; same metal cold worked at −18° C. recrystallized completely only after 200 hr. at −38° C. (P15g, N5, 3-68; Al)

Bol'shov. *Academy of Sciences of the USSR, Bulletin, Physical Series,* v. 20, no. 10, p. 1020-1026. (Columbia Technical Translations.)

Investigation to determine work functions of different faces of Cu and Ge crystals at the melting point. Values obtained differ greatly from those of other researchers; divergence is credited to high purity and cleanliness of materials studied and of equipment used in experiments. 8 ref. (P15k, N12; Cu, Ge)

143-P.* **Lattice Thermal Conductivity of Some Copper Alloys.** W. R. G. Kemp, P. G. Klemens and R. J. Tainsh. *Australian Journal of Physics,* v. 10, Dec. 1957, p. 454-461.

Thermal and electrical conductivities of three Cu-Zn alloys annealed at high temperatures and of two Cu-Au alloys, were measured over wide range of low temperatures and their lattice component of thermal conductivity deduced in the range 2-90° K. The high lattice thermal resistance at liquid helium temperatures previously found in Cu-Zn alloys appears to be a function of solute content rather than of concentration of conduction electrons, and can be reduced by high-temperature annealing. This extra resistance is thus due to dislocations locked in stable arrays by the presence of solute atoms, and not due to changes in the electronic band structure on alloying. 10 ref. (P11h, P16g; Cu, *Au, Zn*)

Effects of heat treatment in the range between room temperature and 1250° C. Bulk lifetime both in p and n-type crystals made by the floating zone method and of n-type crystals made by the Czochralski technique may be increased by annealing at temperatures between about 300 and 700° C. Annealing at temperatures higher than about 700° C. decreased lifetime both in p and n-type crystals. In all cases the samples were relatively slowly cooled. Bulk lifetime was measured by the conductivity modulation method. (P15, 2-64; Si)

174-P.* (English.) **Effect of Silicon, Chromium and Manganese on Equilibrium of Carbon and Oxygen in Molten Iron Saturated With Carbon. Pt. 2.** Siro Ban-ya and Sachio Matoba. *Tohoku University, Technology Reports*, v. 22, no. 1, 1957, p. 97-108.

Addition of Si (5.2%) causes a decrease in solubility of graphite, while Cr (20%) and Mn (40%) increase solubility. Formation of oxides was not observed in the gas phase. Effects of these additions on the activity of graphite were computed. Addition of Si decreases oxygen content, while Cr increases it. Interaction parameter of carbon and oxygen in molten Fe was calculated in the 3.4-7% range. 15 ref. (P12, 2-60; Fe)

Deviations from Ohm's law. (P15; Ag, 14-62)

187-P.* (French.) **Anomalies of Resistivity in Certain Magnetic Metals.** P. G. de Gennes and J. Friedel. *Physics and Chemistry of Solids,* v. 4, No. 1/2, 1958, p. 71-77.

Anomalous resistivity of some rare earth metals and of alloys such as AuMn and Au_2Mn is studied by assuming a connection between conduction electrons and atomic spins. Magnitude of corresponding coss-section is treated as a phenomenological quantity. At high temperatures, atomic spins are at random and conduction electrons have a finite mean free path. At low temperatures, atomic spins are all aligned and no scattering can occur. Short-range order effects in the spin lattice are analyzed in the Born approximation and shown to be small in most physical situations. 16 ref. (P15g; SGA-n)

188-P. (German.) **Potential Oscillations in Iron and Zinc Electrodes Submerged in Sulphuric Acid.** Hans Ludering. *Archiv für das Eisenhüttenwesen,* v. 28, Oct. 1957, p. 625-632.

Theoretical explanation and resulting differential equation. 20 ref. (P15; Fe, Zn)

189-P.* (German.) **Utilization of Thermomagnetic Analysis for the Observation of Transformation Properties of Iron Alloys Between −150 [°C] and + 1500 [°C].** Rudolf Kohlhaas and Heinrich Lange. *Archiv für das Eisenhüttenwesen,* v. 28, Oct. 1957, p. 645-653.

The phase transformations of Fe and its alloys can be observed and investigated by utilizing the magnetic susceptibility of these substances in the paramagnetic as well as the ferromagnetic range. The behavior in extremely high and low temperatures is observed in a chamber with a built-in permanent magnet. The chamber can be evacuated and pressurized. Diagrams showing the magnetic susceptibility in dependence of the temperature clearly indicate the phase transformations (Curie points) for various alloys. 12 ref. (P16, N11; Fe-b)

190-P. (German.) **Effect of Alloy Additions on Conductivity of Metals.** F. Pawlek and K. Reichel. *Metall,* v. 12, Jan. 1958, p. 1-6.

Electric resistance of a pure metal can be increased by alloying. Some 142 values for increased resistance, arranged in tables or shown in graphs. 55 ref. (P15g, 2-60)

193-P. Aluminum Piston Alloys in Germany. Herman Kessler. *Light Metals,* v. 21, Mar. 1958, p. 85-88. (From Technical Report no. 28 of the Aluminumwerke Nürnberg G.m.b.H.)

Technical and physical characteristics of eutectic hypereutectic alloy and hypo-eutectic Al-Si alloys with especially high Si content. (P-general, Q-general, T17, 17-57; Al)

194-P. Properties of Silicon Doped With Iron or Copper. C. B. Collins and R. O. Carlson. *Physical Review,* v. 108, Dec. 15, 1957, p. 1409-1414.

Both Fe and Cu introduce deep levels into the forbidden band of Si which are observable by electrical and optical measurements. 26 ref. (P15, P17; Si, *Fe, Cu*)

195-P. Temperature Dependence of the Magnetic Susceptibility of Alpha-Silver-Zinc Alloys. Lothar Meyer and Dan Weiner. *Physical Review,* v. 108, Dec. 15, 1957, p. 1426-1427.

Magnetic susceptibility measured from 5-35% Zn between room temperature and helium temperatures. All samples became slightly more diamagnetic with decreasing temperature, and any temperature-dependent paramagnetic contribution to the susceptibility due to bound electron states must be less than 0.1% of the room-temperature value of the susceptibility. 9 ref. (P16, 2-61; Ag-b, Zn-b)

196-P. K-Emission Spectrum of Metallic Lithium. D. E. Bedo and D. H. Tomboulian. *Physical Review,* v. 109, Jan. 1, 1958, p. 35-40.

The emission spectrum of an evaporated Li target investigated in spectral region extending from 60 to 600 A. The intensity distribution of the characteristic K-emission

was determined photometrically. 18 ref. (P17d; Li)

197-P.* Normal and Superconducting Heat Capacities of Lanthanum. A. Berman, M. W. Zermansky and H. A. Boorse. *Physical Review,* v. 109, Jan. 1, 1958, p. 70-76.

The heat capacities of three samples of La measured in the temperature range 1.6 to 6.5° K. A four-constant formula was found which represented the resistance-temperature relation of the carbon composition resistance thermometer from 1.6 to 7.2° K. Two superconducting transitions were found in each sample: one at 4.8° K. and the other at 5.9° K. These are associated respectively with the hexagonal close-packed and face-centered cubic modifications of the metal. (P12r; La)

198-P. On the Spectral Characteristics of the External Photoelectric Effect from an Activated Copper-Magnesium Alloy. V. N. Lepeshinskaia and G. A. Iudaev. *Soviet Physics, Technical Physics,* v. 2, no. 3, 1957, p. 450-454. (Translation by American Institute of Physics.)

5 ref. (P15k, P17e; Cu-b, Mg-b)

(P16p, 1-53)

208-P. (Russian.) **Method to Determine Sealed Porosity and Defects in Metallic Structure.** B. V. Lukin and V. G. Nagornyl. *Zavodskaya Laboratoriya,* v. 23, no. 12, 1957, p. 1458-1461.

Quantitative method based on comparison of specific weights as determined by X-ray and pycnometer. (P10m, M27, 1-53)

209-P. (Russian.) **Method of Constructing Actual Characteristics of Materials During Uniaxial Elongation and Contraction.** K. K. Likharev. *Zavodskaya Laboratoriya,* v. 23, no. 12, 1957, p. 1472-1477.

4 ref. (P10d)

210-P.* Graphite as a High Temperature Material. John E. Hove. *AIME Transactions,* v. 212, Feb. 1958, p. 7-13.

High-temperature physical properties of graphite interpreted in the light of present-day knowledge of the mechanisms affecting these properties. 22 ref.
(P-general, 2-62; NM-k36)

211-P. Electric Conductivity as Nondestructive Testing Method for Structural Changes in Surface Layers. A. Keil. *AIME Transactions,* v. 212, Feb. 1958, p. 63-64.

Experiments with Ag alloys containing 8% Cd with Ag-Cu alloys show that decomposition of the homogeneous solid solution by internal oxidation may have differing effects on conductivity. Eddy-current measurements are a convenient aid in measuring the structural differences between homogeneous alloys and the state reached by the thermal treatment. 8 ref.
(P15g, 1-54, N-general, Ag-b, *Cu*)

212-P. On the Solubility of Iron in Magnesium. K. Anderko, A. S. Yamamoto and W. Rostoker. *AIME Transactions,* v. 212, Feb. 1958, p. 85.

(P12, Mg, *Fe*)

213-P.* Solubility of Nitrogen in Liquid Iron and Iron Alloys. Vikosh C. Kashyap and Norman Parlee. *AIME Transactions,* v. 212, Feb. 1958, p. 86-91.

Solubilities of nitrogen in liquid iron and liquid Fe-Ni, Fe-Mo, Fe-V and Fe-Mo-V alloys were measured by the Sieverts method. Measurements were made at 1600 to 1800° C. on binary alloys up to 20% Ni, 10% V, 10% Mo; and on ternary alloys containing 0 to 3% V with 0 to 5% Mo. Results confirm that Sieverts' law is obeyed in the range 50 to 750 mm. pressure. 19 ref. (P12e, *N,* Fe)

214-P. Activity Measurement in the System Iron-Chromium. C. L. McCabe, R. G. Hudson and H. W. Paxton. *AIME Transactions,* v. 212, Feb. 1958, p. 102-105.

Vapor pressures of pure Fe and pure Cr measured by the Langmuir and Knudsen methods agree within experimental error at 1200° C. Knudsen cell experiments show that Cr and Fe show thermodynamic behavior close to ideal at 1205 and 1250° C. in the system Fe-Cr. 12 ref. (P12; Fe, Cr)

215-P.* The Vapor Pressure of Palladium. J. F. Haefling and A. H. Daane. *AIME Transactions,* v. 212, Feb. 1958, p. 115-116.

Vapor pressure of Pd was found to be higher than the estimated values in literature by a factor of about 15. Results indicate an abnormally weak binding in the case of Pd which is consistent with the lower value of the heat of vaporization found. 13 ref. (P12c; Pd)

216-P.* Thermodynamic Study of Liquid Pb-Zn Solutions. F. D. Rosenthal, G. J. Mills and F. J. Dunkerley. *AIME Transactions,* v. 212, Apr. 1958, p. 153-161.

Activities, free energies and heats and entropies of mixing of liquid Pb-Zn alloys obtained by the electrode-potential method between 400 and 650° C. A vapor-pressure method was used to extend the activity measurements to 900° C., allowing the maximum of the immiscibility gap to be estimated by thermodynamic calculation. Data on the monotectic and eutectic points. 18 ref. (P12; Pb, Zn)

217-P.* Studies on the Metallurgy of Silicon-Iron. Pt. 1. Silicon Nitrides. Pt. 2. Anomaly in the Alpha Solid Solution. Alan U. Seybolt. *AIME Transactions,* v. 212, Apr. 1958, p. 161-167.

Pressure-temperature relations required to maintain the existence of

Si_3N_4 in Si-Fe of 0.44-11.7% Si partially explored. Calculation of some thermodynamic quantities; evidence of an order-disorder two-phase field extending at 800° C. from about 1 to 5.5% Si. 16 ref. (P12, N10; Si, Fe)

218-P. Solubility and Activity of Titanium in Carbon-Saturated Iron. F. D. Delve. *AIME Transactions,* v. 212, Apr. 1958, p. 183-185.

(P12e, P12b; Fe, *C, Ti*)

219-P. Reduction of Magnetic Susceptibility in Beryllium-Copper. Harold Bernstein. *AIME Transactions,* v. 212, Apr. 1958, p. 225-226.

Presence of iron impurity causes variations in magnetic properties. Effect of small amounts of iron on susceptibility. (P16, 1-60; *Be,* Cu)

220-P. Magnetic Properties and the Structure of Metals. W. Sucksmith. *British Journal of Applied Physics,* Supp. 6, 1957, p. S24-S27.

Use of magnetic properties to detect variations in structure and properties of magnetic materials. Newer developments in magnetism and their application. 9 ref. (P16, S13h; SGA-n)

221-P. Heat Transfer Through Coated Metal Surfaces. Robert L. Lee. *Corrosion,* v. 14, Apr. 1958, p. 187t-188t.

Application of 4-mil phenolic and 15-mil vinyl coatings on steel in heat exchangers decreased corrosion and gave higher heat transfer rates than ultimately experienced with corroded uncoated metal surfaces. (P11k, W13b, 8-70)

222-P.* Note on the Influence of Sodium on Magnesium-Lithium Alloys. R. J. M. Payne and J. D. L. Eynon. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 351-352.

Solubility of sodium in Mg-Li alloys varies with temperature. Alloys containing Na may become embrittled on standing at ordinary temperatures or during certain heat treatments. Tolerance for Na depends on grain size; for a cast binary 12% Li alloy it is in the region of 0.002%. 8 ref. (P12e, Q26s, 2-60; Mg-b, *Li, Na*)

223-P.* Some Investigations on Plutonium Metal. E. Dempsey and A. E. Kay. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 379-384.

An adiabatic method for measuring specific heat of Pu which makes use of the self-heating of the metal to raise the temperature of the specimen. Results for the alpha phase above room temperature, including an estimate of the alpha→beta heat of transformation. Preliminary experiments on the oxidation of Pu in air. 16 ref. (P12q, P12r; Pu)

241-P. Irreversible Changes in Length of Zinc Under Thermal Stress. K. Claus and K. Lohberg. *United Kingdom Atomic Energy Authority,* IGRL-T/C-43, 1957, 17 p.

Changes of length with segregation processes; analysis of length changes with annealing of high-grade Zn; length changes due to thermal cycling; explanation due to anisotropy of the Zn crystal; length changes with recrystallization and grain growth; associated changes in the thermal expansion coefficient, the elastic modulus and the texture. 9 ref. (P10d, P11g; Zn)

242-P.* Properties and Applications of Commercial Molybdenum and Molybdenum Alloys. R. R. Freeman. Paper from "The Metal Molybdenum", American Society for Metals, p. 10-30.

Physical, chemical, mechanical properties; transition temperatures; creep-rupture properties; commercial availability; fabricating methods. Fields of future application include the glass industry, metalworking, chemical and nuclear energy (for heat exchangers), aircraft and missiles, high-temperature engines. 9 ref.

(P-general, Q-general, 17-57; Mo)

243-P. Electric Properties of Some Compounds of Elements in the Third and Fifth Groups of the Periodic Table (InAs and InSb). D. N. Nasledov and A. Iu. Khalilov. *Academy of Sciences of the USSR, Bulletin,* v. 20, no. 12, 1956, p. 1370-1371. (Columbia Technical Translations, Inc.)

The temperature dependence of the conductivity of samples with p and n-type conductivity was determined in the range from 1.3° K. The Hall coefficent in the region of the transition from intrinsic conductivity changes sign as the magnetic field intensity is increased, which is in agreement with Madelung's theory. An anomalous increase in the carrier mobility with heating of the sample was observed in indium arsenide at high temperatures. (P15; In, Sb, As)

281-P.* The Freezing Points of High-Purity Metals as Precision Temperature Standards. Pt. 3. Thermal Analyses on Eight Grades of Zinc With Purities Greater Than 99.99 + %. E. H. McLaren. *Canadian Journal of Physics,* v. 36, May 1958, p. 585-598.

Liquidus points intercompared with a precision of about 0.002° C. and alloy melting ranges examined following different rates of freezing. A melting range parameter may provide a more sensitive index of the purity than the liquidus temperature since the shape of the melting curve is strongly influenced by segregation of impurities due to coring and freezing. 12 ref.
(P12n; Zn-a)

282-P.* Thermo-Electricity at Low Temperatures. Pt. 5. Suitability of Lead as a Standard Reference Material. J. P. Jan, W. B. Pearson and I. M. Templeton. *Canadian Journal of Physics,* v. 36, May 1958, p. 627-630.

Measurements by improved method of the thermo-electric force, as a function of temperature of dilute lead alloys containing bismuth, tin, indium and cadmium in solid solutions. 4 ref. (P15, 2-63; Pb)

283-P.* Thermal Restoration of Oxygenated Germanium Surfaces. A. J. Rosenberg, P. H. Robinson and H. C. Gatos. *Journal of Applied Physics,* v. 29, May 1958, p. 771-775.

Cleaved Ge surfaces, oxygenated at room temperature, were heated under high vacuum and the restoration of their oxygen-adsorbing capacity determined. No restoration was observed at 425° C., above 575° C., however, the oxygen-adsorbing capacity of the surfaces was completely recovered. Discharge of GeO from the surface was associated with this process. The restoration process followed first-order reaction kinetics with an activation energy of 56 k-cal. per mole. Concurrently with restoration a pronounced decrease in the surface area was observed. (P13d, P13a; Ge, *O*)

284-P.* Combustion of Zirconium in Oxygen. W. L. Doyle, J. B. Conway and A. V. Grosse. *Journal of Inorganic and Nuclear Chemistry,* v. 6, no. 2, 1958, p. 138-144.

The combustion of Zr in oxygen leads to one of the highest temperatures obtainable by the combustion of metals—estimated to be 4930° K. at 1.0 atm pressure. Technique developed for operating a powdered zirconium-oxygen flame, producing the highest metal flame temperature reported to date. 16 ref. (P12; Zr)

285-P. Semiconducting Properties of Mg_2Si Single Crystals. R. G. Morris, R. D. Redin and G. C. Danielson. *Physical Review,* v. 109, Mar. 15, 1958, p. 1909-1915.

19 ref. (P15g; Mg, Si, 14-61)

286-P. Semiconducting Properties of Mg_2Ge Single Crystals. R. D. Redin, R. G. Morris and G. C. Danielson. *Physical Review,* v. 109, Mar. 15, 1958, p. 1916-1920.

Alloys of Pb and Sb which are formed on the basis of solutions of variable composition exhibit electrical characteristics completely definable in terms of the state of the primary solutions in the alloys. The electrical conductivity of the alloys is a function of the component concentration and the thermal state of the alloy. The temperature dependence of the electrical conductivity of a 1:1 alloy provides a sufficiently clear indication of the effect of the number of dissolved atoms (i.e., of the spots which exhibit a new short-range order) upon the magnitude and nature of the electrical conductivity. 9 ref. (P15; Pb, Sb)

295-P.* (French.) **Measurement of Magnetocaloric Effect of MnAs.** Andre J. P. Meyer and Pierre Taglang. *Comptes Rendus*, v. 246, Mar. 24, 1958, p. 1820-1822.

Additional proof of antiferromagnetism of MnAs above its polymorphic transformation at 45° C. was obtained by measurement of magnetocaloric effect in function of temperature. 5 ref. (P16d, 2-61; Mn, As)

296-P. (French.) **Near-Saturation of Polycrystalline Ferromagnetic Materials in I/H^2.** Henri Danan. *Comptes Rendus*, v. 246, Mar. 24, 1958, p. 1822-1824.

303-P.* The Lattice Thermal Conductivity of a Gold-Platinum Alloy. J. A. Birch, W. R. G. Kemp and P. G. Klemens. *Physical Society Proceedings,* v. 71, May 1, 1958, p. 844-845.

Thermal and electrical conductivities of a 98% Au, 2% Pt alloy over a wide range of low temperatures measured and the lattice thermal conductivity from 2-90° K. deduced. 7 ref. (P11h, P15, 2-63; Au, *Pt*)

304-P. Thermal Expansion of Rare Earth Metals. Fred Barson, S. Legvold and F. H. Spedding. Iowa State College. *U. S. Atomic Energy Commission,* ISC-831, June 1956, 71 p. (Order from Office of Technical Services, Washington 25, D. C.) $2.

High-temperature dilatometric investigation; coefficients of expansion; evidence of crystalline transformations which may occur; light cast on certain high-temperature transitions already discovered in several of the metals. Metals investigated were lanthanum, cerium, praseodymium, neodymium, gadolinium, terbium, dysprosium, erbium and ytterbium. 82 ref. (P11g; EG-g)

305-P. Irradiation Effects in Uranium. S. H. Bush. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 591-615.

Mechanical properties such as hardness, bend and tensile data are reviewed. Variables considered include burn-up, irradiation temperature, U^{235} content, composition (to 3 wt. % alloy), post-irradiation annealing and tensile testing temperature. Drastic reductions in ductility occur at burn-ups as low as 0.02 at. %. Recovery of damage is limited on post-irradiation annealing. Changes in such physical properties as density, thermal conductivity, electrical resistivity and modulus of elasticity are reported. Effect of irradiation on microstructure. 45 ref.
(P-general, Q-general, M27, 2-67; U)

306-P. (English.) **Electrical Properties of Ag_2Te.** Shin-ya Miyatani. *Physical Society of Japan, Journal,* v. 13, Apr. 1958, p. 341-350.

10 ref. (P15; Ag, Te)

307-P.* (French.) **Measurement of Variation of Coercive Force in Function of Angle in Nickel Films Condensed in Vacuo.** A. Van Itterbeek and A. Dupre. *Journal de Physique et le Radium,* v. 19, Feb. 1958, p. 113-118.

Coercive force of evaporated Ni and Co films determined by measurement of magnetoresistance. Evaporation apparatus described. Thickness of films determined by optical method. Coercive force as function of angle between normal to plane of film and direction of magnetic field. Change of coercive force as function of temperature. (P16; Ni, Co, 14-62)

308-P* (Russian.) **Thermo-Electronic Emission From Binary Alloys During Process of Formation.** K. F. Voitsekhovskii. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 3-7.

The effect on the current of themo-electronic emission was studied while the atomic arrangement in a crystalline lattice of binary alloys was changing. Richardson's basic formula was confirmed and the problem of dependence of Richardson's constant on the range of S and concentration of C in case of cubic and other crystalline lattices was examined. This mathematical analysis is submitted for discussion. 10 ref. (P15k)

309-P.* (Russian.) **The Nonlinear Theory of Transitional Processes in Ferromagnetic Layers Magnetized by Longitudinal Alternating Poles.** N. N. Zatsepin. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 30-36.

The problem was examined mathematically. With the help of small parameters the problem of finding electromagnetic parameters for transition processes in homogeneous layers was resolved. In particular an expression was found for distribution of magnetic pole, induction and permeability of thicker layers, when magnetic poles of rectangular impulse were acting upon them. Numerical values are expressed for linear and nonlinear members. 6 ref. (P16)

310-P.* (Russian.) **Ferromagnetic Phase in Austenitic Heat Resistant Steel, Type 14-14.** V. Z. Tseitlin. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 37-43.

Ferromagnetic alpha phase may have place in the structure of austenitic steels. It appears not only in the process of aging, but also as result of annealing after hardening, and disappears under definite conditions. It develops along grain boundaries and around individual carbides. Development of ferromagnetic phase under plastic deformation when gamma-alpha transformation is brought about by nondiffusion. 4 ref. (P16; SS)

311-P.* (Russian.) **Determination of Atom Distribution Density in Liquid Al and Bi by Means of Distinctive Temperatures Determined by Electronographic Data.** A. I. Bublik and A. G. Buntar. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 53-57.

The density of radially distributed atoms was plotted against temperature. The quantity of the nearest atoms was determined at various temperatures. In liquid Al at fusion temperature the nearest sequence appears to be basic as well as crystalline. The density of particles diminishes at higher temperatures. In Bi, particles are arranged at near crystallization temperature in same order as in solid state. At high temperatures, Al and Bi approach medium density. 6 ref. (P12, M25; Al, Bi, 14-60)

Electric properties of electro-sheet, the alloys used and influence of the degree of purity with which values of the magnetic properties increase. Magnetic anisotropy and influence of hot and cold rolling upon quality and processing. Survey of types and qualities available.

(P15, P16, T1, 17-57; ST, *Si*)

334-P.* (German.) **Possibilities of Influencing the Physical Properties of Ferromagnetic Materials.** H. Jahn. *Die Technik,* v. 13, Feb. 1958.

Influencing of radioactive rays or magnetic fields. Samples treated in magnetic field showed noticeable differences in hardness, notch impact and tensile strength as compared with normally annealed samples, especially in low-carbon steels. Tests with greater cooling speeds showed mostly negative effects. Improvements in notch impact were obtained with high carbon contents. Influence of magnetic field treatment on properties of a Cr alloy steel. Tests indicate possibility of dispensing with expensive alloy components, by improvement of the properties of carbon steels in magnetic fields. 23 ref.

(P16, J-general, Q-general; CN)

335-P.* (Russian.) **Residual Electro-Resistance in Binary System of Metallic Alloys.** N. V. Grum-Grzhimailo. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 23-29.

Dependence of electro-resistance of binary alloys on their composition is not satisfactorily explained. The electrical conductivity theory proposed by Blokh and Nordheim does establish this dependence for the homogeneous phase of univalent alloys. A series of experiments on different alloys disproved Nordheim's formula of interpolation. 15 ref. (P15g, 2-60)

336-P.* (Russian.) **Comparative Measurement of Vapor Pressure of Chromium and Iron by Speed of Vaporization in Vacuum.** V. D. Burlakov, *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 91-101.

When heated together through a wide range of temperatures Cr and

Fe vaporize at the same intensity. To clarify this phenomenon experiments were carried out separately for Cr and Fe. The open surfaces of the metals were vaporized in vacuum and the quantity of evaporation was determined either by the thickness of the evaporated layer, or by weighing the sample and the condensate. The results were analyzed mathematically. 12 ref. (P12c; Cr, Fe)

337-P.* (Russian.) **Problem of Latent Energy of Deformation in Solid Solutions.** V. E. Panin and V. G. Milevskaya. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 120-126.

Latent energy of deformation in solid solutions of Cu-Ni system varies with the amount of fusion along the curve, with the maximum value at the mean region of concentration. This is dependent on the change in hardness, electrical resistance, dynamic coefficient, thermal electromotive force and other properties depending on composition. 9 ref. (P12; Cu, Ni, 14-67)

338-P. Scientists Develop "Four-Way" Magnetic Steel. *Electrical Engineering,* v. 77, Jan. 1958, p. 106-108.

Cube-oriented Si-Fe.

Heats of formation at 308° K. determined by liquid tin solution calorimetry for a series of alloys covering the alpha-phase of the Ag-Cd alloy system. (P12r, X24e; Ag-b, Cd-b)

345-P. Experiments Using a Simple Thermal Comparator for Measurement of Thermal Conductivity, Surface Roughness and Thickness of Foils or of Surface Deposits. R. W. Powell. *Journal of Scientific Instruments,* v. 34, Dec. 1957, p. 485-492.

Two metal balls are similarly mounted in a block of balsa wood, but one is at a slightly lower level so that it touches any surface on which the block rests. After heating to a small fixed temperature excess the block is laid in contact with the test surface. Differentially connected thermocouples attached to each ball measure the increased rate of cooling of the ball which makes contact. The differential e.m.f. observed after contact is made is shown to be a function of the thermal conductivity of the material on which the ball rests. 8 ref. (P11h, S14c, S15c, 1-53)

368-P. (Japanese.) **Electrical Resistance of Dumet Wire.** Tetuya Arizumi, Totaro Haida and Yoichi Ueda. *Japan Journal of Applied Physics,* v. 27, Apr. 1958, p. 224-228.

The wire is assumed to consist of parallel resistances of Cu, brass and Ni-Fe alloy. The change of resistance of the wire by heat treatment is measured by means of a double bridge and potentiometer. 5 ref. (P15g, S11g, T1b; Cu, Cu-n, Fe, Ni, 4-61)

369-P. (Russian.) **Effect of Aluminum on Specific Losses of Transformer Steel.** N. F. Dubrov. *Stal',* v. 18, Mar. 1958, p. 246-248.

Aluminum should not be added to transformer steel which is annealed at high temperature during either deoxidation or in alloying with ferrosilicon. 4 ref.

(P16; ST, *Si, Al,* SGA-n)

370-P.* Surface Tension of Titanium, Zirconium, and Hafnium. A. W. Peterson, H. Kedesdy, P. H. Keck and E. Schwarz. *Journal of Applied Physics,* v. 29, Feb. 1958, p. 213-216.

Surface tensions of Ti, Zr and Hf at their melting points measured in pure argon atmosphere by drop-weight method. A uniform longitudinal field induction coil was used to melt the sample rod tip. The

average values obtained were 1390 ± 40, 1400 ± 40 and 1460 ± 40 dynes per cm., respectively.
(P13h; Ti, Zr, Hf)

371-P.* Nature of Electrical Resistivity of the Ferromagnetic Metals at Low Temperatures. E. Kondorsky, O. S. Galkina and L. A. Tchernikova. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 243-246.

Resistivity of Ni, Fe and Ni-Cu alloys with Cu up to 25% at temperatures from 2 to 78° K. Empirical formulas.
(P15g, 2-63; Ni, Fe, *Cu*)

372-P.* Flux Reversal in Thin Films of 82% Ni, 18% Fe. C. D. Olson and A. V. Pohm. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 274-282.

Magnetization reversal process of Fe-Ni films (nominally 82% Ni, 18% Fe) deposited in the presence of a magnetic field to a thickness of about 1000 to 4000 Å. Experimental results indicate at least two different magnetization reversal mechanisms. The first, characterized by relatively long remagnetization periods, involves domain-wall movement; the second, characterized by relatively short remagnetization periods, is consistent with the rotation of the magnetization in the plane of the film. 17 ref.
(P16; Ni-b, *Fe,* 14-62)

373-P.* Domain-Wall Structure in Permalloy Films. E. E. Huber, D. O. Smith and J. B. Goodenough. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 294-295.

Domain-wall structure in Permalloy films in thickness range 25 to 2000 Å studied by the Bitter technique. A new type of 180° wall has been observed; the main wall is cut at regular intervals by short, right-angle "cross ties" which terminate in free, single ends. The cross-tie period and length are dependent on film thickness, each becoming shorter with decreasing thickness. These patterns can be understood in terms of a new model for the structure of domain walls in thin films of low-anisotropy material. (P16c; SGA-n)

374-P.* Physical and Magnetic Properties of Elongated Single-Domain Iron and Iron-Cobalt Permanent Magnets. R. C. Lever, E. J. Yamartino and R. B. Falk. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 304-306.

Physical and magnetic properties of permanent magnets compacted from elongated single-domain particles with metal and organic matrices. Their unique properties which make possible novel design and application possibilities include: demagnetization curve flexibility; high-energy and energy-to-weight ratio; uniformity of pole face flux; low-temperature coefficient of remanence, precise dimensional tolerances; excellent machinability; solderability; low critical material content; and short radioactive half-life. (P16; Fe, Co, SSA-n)

375-P.* Loss of Exchange Coupling in the Surface Layers of Ferromagnetic Particles. F. E. Luborsky. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 309-310.

Experiments with spherical Fe particles 28 to 265 Å in diameter demonstrate that the proposed nonferromagnetic surface layer on an Fe particle must be less than 1 Å thick (i.e., about one atomic radius). This conclusion is based upon a comparison of the ferromagnetic Fe calculated from the magnetic saturation, and the total amount of Fe as determined by chemical analysis. 7 ref. (P16; Fe)

376-P.* Heats of Formation of Liquid Alloys at 1100° by a Simple Reaction Calorimeter. R. A. Oriani and W. K. Murphy. *Journal of Physical Chemistry,* v. 62, Feb. 1958, p. 199-202.

Design and operation of a high-temperature reaction calorimeter capable of ± 10% accuracy. Enthalpies of formation at 1100° of liquid Ag-Au, Ag-Cu and Au-Ni alloys from their liquid components. Similarity between the interactions in the liquid solution and those in the solid solution.
(P12r; Ag, Au, Cu, Ni, 14-60)

377-P.* The Thermal and Electrical Resistivity of Bismuth and Antimony at Low Temperatures. G. K. White and S. B. Woods. *Philosophical Magazine,* v. 3, Apr. 1958, p. 342-359.

Electrical resistivity of pure polycrystalline specimens of Bi and Sb over the range 2 to 300° K. and thermal conductivity up to 150° K. Some measurements made in a magnetic field allow separation of the thermal conductivity into electronic and lattice components. Below 50° K., it appears that the heat

conductivity of Bi is nearly all due to lattice waves; free electrons seems to contribute little to the conduction or to the scattering. In Sb, however, the lattice conductivity is smaller than might be expected at low temperatures suggesting significant scattering by free electrons. (P11h, P15g, 2-63; Bi, Sb)

378-P.* Superconductivity of Thorium Below 1° K. Norman M. Wolcott and Robert A. Hein. *Philosophical Magazine,* v. 3, June 1958, p. 591-596.

Critical magnetic field of thorium determined between 0.1° K. and 1.37° K., the transition temperature, where the initial slope of the critical field curve is 190 gauss per degree. The data indicate a value of 162 gauss for the critical field at absolute zero. The critical field curve departs from a parabola near the transition temperature. 6 ref. (P15g, 1-63; Th)

379-P.* Characteristics of the Additional Conductivity Induced in Single-Crystal Cadmium Selenide by X-Irradiation. Pt. 2. Kinetic Aspects. S. V. Svechnikov. *Soviet Physics, Technical Physics,* v. 2, 1957, p. 2328-2331. (Translation by American Institute of Physics, Inc.)

Rate of photocurrent rise in single-crystal cadmium selenide studied as a function of X-ray intensity, wave length and intensity of illumination and field and temperature of the specimen. The conductivity kinetics are explained by impurities, and by double optical space-charge currents assignable to transitions. (P15g, 2-67; Cd, 14-61)

380-P. Characteristics of the Additional Conductivity Induced in Single-Crystal Cadmium Selenide by X-Irradiation. Pt. 1. Static Characteristics. S. V. Svechnikov. *Soviet Physics, Technical Physics,* v. 2, 1957, p. 2320-2327. (Translation by American Institute of Physics, Inc.)

The voltage-current and dosimetric characteristics of CdSe single crystals on X-irradiation. Both are super-linear. Experimental observations are explained satisfactorily by supposing a space change to exist in the crystal and adopting Lashkarev's double optical transitions. 13 ref. (P15g, 2-67; Cd, 14-61)

381-P. (French.) **Reactivity of Metallurgical Slag Constituents. Its Relation to Thermodynamic Activity and the Constitution of Melted Silicates.** Traian T. Negresco. *Revue de Métallurgie,* v. 3, no. 1, 1958, p. 5-40.

Effect of temperature, atmospheric oxygen and sulphur content on the modifications undergone by the compositions of a large series of ternary synthetic slags of the type SiO_2-CaO-Al_2O_3, SiO_2-CaO-MgO, SiO_2-CaO-FeO, SiO_2-MgO-FeO, etc. 13 ref. (P12; RM-q)

382-P. (Russian.) **Experimental Investigation of the Viscosity of Basic Martensite Slags. Pt. 1. Viscosity and Electrical Conductivity of Basic Slags Under Laboratory Conditions.** Iosif Tripsha. *Revue de Métallurgie,* v. 3, no. 1, 1958, p. 41-60.

Empirical formulas developed for computing the effect of temperature and chemical composition on the viscosity of martensitic basic slags and the relation between the viscosity and the electrical conductivity. 15 ref. (P10f, P15g; RM-q)

383-P.* Study of the Distortion of High-Carbon High-Chromium Die Steels. K. Sachs. *Iron and Steel Institute, Journal,* v. 189, July 1958, p. 216-224.

Test reveals the influence of carbide distribution on the susceptibility to distortion. Accentuated distortion resulting from a longitudinal temperature gradient emphasizes the importance of even temperature distribution in the hardening furnace. 7 ref.

The behavior of ferromagnetic precipitates in Cu-Co alloy containing 2% Co heat treated with magnetic field. The magnitude of magnetic anisotropy induced by magnetic annealing measured as functions of the aging temperature, aging time and intensity of magnetic field. 26 ref. (P16; Cu, Co)

385-P.* (French.) **Possible Effect of Air on Very Thin Films of Silver.** Jean Trompette. *Comptes Rendus,* v. 246, June 9, 1958, p. 3235-3238.

On basis of calculated indices of refraction and extinction of thin film and solid metal, optical constants of thin film of Ag deposited by thermal projection on strip of quartz were determined for film in vacuum and subsequently under atmospheric pressure. 4 ref.
(P17a, 2-66; Ag)

386-P.* (French.) **Thermomagnetic Study of the Allotropic Forms of Plutonium.** M. Seguin, M. M. Folmer, J. Friedel and E. Grison. *Comptes Rendus,* v. 246, June 9, 1958, p. 3243-3246.

Magnetic susceptibility of Pu determined over wide range of temperature by combining measurements taken during heating and cooling. No magnetic anomaly was noted; none of the allotropic forms appear to present paramagnetism of Curie-Weiss type. 7 ref. (P16; Pu)

387-P.* **The Fluidity of Some Aluminum Alloys.** S. Floreen and D. V. Ragone. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 391-393.

The fluidity of Al-Cu (0.33% Cu) and Al-Mg alloys (0.33% Mg) was measured using glass tubes as the fluidity channel. The fluidity of the alloys both at the liquidus and above varies inversely with the solidification range. 6 ref. (P10f; Al-b, Cu, Mg)

388-P.* **Magnetic Properties of Type 400 Series, 17-4 PH, and AM 355 Stainless Steels.** J. V. Alger. *Bettis Technical Review,* WAPD-BT-7, Mar. 1958, p. 131-137.

The magnetic induction behavior of various types of stainless steels is utilized to design magnetic devices associated with reactor control rod drive mechanisms. (P16; SS-b)

389-P.* **Domain Observations on Iron Whiskers.** R. W. DeBlois and C. D. Graham. *Journal of Applied Physics,* v. 29, June 1958, p. 931-939.

Ferromagnetic domain walls have been observed by standard methods on iron whiskers. The whiskers are square in cross section, generally 20 to 60 microns on a side, and up to 1 cm. long. The whiskers are single crystals with the axis in a <100> direction and the faces nearly perfect {100} planes. The domain patterns are exceptionally clear and simple. Several characteristic patterns have been described and represented with three-dimensional models. 15 ref. (P16c; Fe, 14-61)

390-P. Relation Between Crystallite Orientation and Magnetic Properties of Elongated Single-Domain Iron Particles. E. F. Fullam and D. S. Hallgren. *Journal of Applied Physics,* v. 29, June 1958, p. 989-993.

Crystallographic orientation of the particles, determined by electron diffraction, is compared to the orientation inferred from the observed morphology and magnetic properties. 15 ref. (P16; M26c, Fe)

391-P.* **Polarization and Overpotential of Au-Cu Alloy in Aqueous Solutions.** I. A. Ammar and S. Riad. *Journal of Physical Chemistry,* v. 62, June 1958, p. 660-664.

Cathodic and anodic polarization measurements have been carried out on an alloy of Au and Cu in aqueous solutions. Attempts have been made to explain the results obtained and these have been compared with the results on pure Au and Cu. (P15; Al-b, Cu-b)

392-P.* **Volume Change of Indium Antimonide During Fusion.** Norman H. Nachtrieb and Noriko Clement. *Journal of Physical Chemistry,* v. 62, June 1958, p. 747-750.

The change in volume of indium antimonide on fusion determined from measurements of the change in pressure of argon at constant volume. The average of six determinations gives $100\ \Delta V/V_s = 13.7 \pm 0.5\%$, referred to the solid. 9 ref. (P10d; In, Sb)

393-P. Study on Castability. Pt. 2. Kazuo Hori. *Kumamoto University, Faculty of Engineering, Memoirs,* v. 5, Dec. 1957, 2 p.

Viscosity and fluidity of molten metal. (P10f, E-general)

394-P. A Review of Heat Transfer Literature, 1957. E. R. G. Eckert, J. P. Hartnett and T. F. Irvine. *Mechanical Engineering,* v. 80, June 1958, p. 64-75.

Reviews conduction, channel flow, boundary layer flow, flow with separated regions, transfer mechanism, natural convection, transpiration cooling, change of phase, radiation, liquid metal, measurement techniques and heat transfer applications. 270 ref. (P11k)

395-P.* **Heat Capacity of Copper-Germanium Alloys Below 4.2° K.** John A. Rayne. *Physical Review,* v. 110, May 1, 1958, p. 606-611.

Heat capacity measurements below 4.2° K. on a series of alloys in the primary phase of the Cu-Ge system. When corrected for lattice expansion, the resulting change in the electronic specific heat for low electron/atom ratios is found to be the same as that for the Cu-Zn system. 20 ref. (P12r, 2-63; Cu, Ge)

396-P.* **Lattice Conductivity of Tin.** M. Garfinkel and P. Linden-

feld. *Physical Review,* v. 110, p. 883-887.

Thermal conductivities of several impure Sn specimens measured at liquid helium temperatures. Impurities of antimony, bismuth and indium between 0.1 and 6% were used to lower the electronic conductivity. Investigation was aimed at obtaining a measure of the lattice contribution to the thermal conductivity of Sn. 13 ref.
(P12h, 2-63; Sn, *Bi, In, Sb*)

397-P. The Variation With Temperature of the Magnetic Leakage Field in Cobalt. M. Blackman and E. Grunbaum. *Royal Society Proceedings,* v. 245, June 24, 1958, p. 408-416.

The variation with temperature of the magnetic leakage field of an unmagnetized crystal of hexagonal Co investigated by means of an electron beam. It was found that the strength of the magnetic leakage field decreased steadily with increasing temperature. 12 ref. (P16; Co)

398-P. Surface States on Germanium. George Wallis. *Sylvania Technologist,* v. 11, Jan. 1958, p. 6-12.

The properties of slow and fast surface states on etched Ge; some methods of investigating the states. 25 ref. (P15; Ge)

399-P. Thermal Conductivity of Tellurium. G. B. Bagduev and M. A. Kazhlaev. *Soviet Physics, "Doklady",* v. 2, 1957, p. 556-558. (Translation by American Institute of Physics, Inc.)

Results of investigations of the temperature dependence of thermal conductivity λ in pure Te from 10° to 500°. The thermal conductivity was determined by the plane compensating method [3] in a vacuum which protected the specimens from oxidation at the melting point. 9 ref. (P11h; Te)

400-P. Vitreous Semiconductors. Some Properties of Materials in the As_2Se_3-As_2Te_3 System II. T. N. Vengel and B. T. Kolomiets. *Soviet Physics, Technical Physics,* v. 2, 1957, p. 2314-2319. (Translation by American Institute of Physics, Inc.)

6 ref. (P15; As, Se, Te)

401-P. Superconductivity of Beryllium Films Condensed on a Cold Backing. B. G. Lazarev, A. I. Sudovtsev and A. P. Smirnov. *Soviet Physics JETP,* v. 6, Apr. 1958, p. 816-817. (Translation by Consultants Bureau, Inc.)

Thickness of the measured films was approximately 10^{-6} cm. The only stable films were those thinner than 10^{-5} cm.; further increase in thickness caused them to crack.

A study of the variation of the refractoriness of 80 different serpentine and dolomite ceramic mixtures in which the percent dolomite increased from 0 to 100.
(P11; RM-h)

404-P.* (Spanish.) **Porosity in 85-5-5-5 Type Bronze Castings. Pt. 2. Effect of Thickness of Section, Pouring Temperature and Feeder System.** Sebastian F. Matas. *Revista de Ciencia Aplicada,* v. 12, May-June 1958, p. 238-244.

Parts with sections of graduated thickness revealed decrease in density of bronze as thickness of section increased. However, an irregular low density was noted for 3-mm. section poured at 1120° C. Increase in pouring temperature appeared to increase density of 3-mm. section. Density of 6-mm. sections varied little with different pouring temperatures. Porosity produced at low temperature pouring due to nonfilling of microcavities caused by contraction is of same order as that produced at higher temperatures by release of gases; 12 and 24-mm. sections showed decrease in density with increase in pouring temperature. In casting of hollow cylinders, no appreciable influence of feeder design was revealed by pressure tests under water; metallurgy of bath seems to be more important factor here. 5 ref.

Electrical resistivities to 500° F. were determined for the cast Mg alloys AZ31A and B, AZ36A, AZ81A, AZ91C, AZ92A, AM100A, EK30A EK41A, EZ33a HK31A, rolled HK31A and HM21XA, extruded HM31XA, cast HZ32A, EM31, EM31 (Zr grain refined), EK31 (with rare earth in the ratio 2 Di/1 MM), and EK31 (with rare earth as Di only). Thermal conductivities of cast AZ31A and B, AZ63A, AZ81A, AZ91C, AZ92A, AM100A, EK30A, EK41A, EZ33A, HK31A, rolled HK31A and HM21XA, and cast HZ32A were calculated from the electrical data. Values of enthalpy, specific heat, and heat of fusion measured for AZ31B, HK31A, HM21XA, HM31XA, and ZK60A.

441-P.* Note on the Specific Heat of Plutonium Metal. D. J. Dean, A. E. Kay and R. G. Loasby. *Institute of Metals, Journal,* v. 86, June 1958, p. 464.

Values for the specific heat of Pu over the range from −40 to 550° C. and for the latent heats of transformation at the various phase transitions. (P12r, P12q; Pu)

442-P.* An Evaluation of Interface Energies in Metallic Systems. J. W. Taylor. *Institute of Metals, Journal,* v. 86, June 1958, p. 456-463.

Method for calculating solid-solid and solid-liquid interface energies based on estimates of grain boundary energies of a number of pure metals and solid solutions. Grain-boundary energies are derived from

the corresponding liquid surface energies, coupled with the assumption that the surface energy of a solid metal or alloy may be estimated from that of the corresponding liquid by applying a correction of one-third of the latter for the increase of surface energy on freezing and that the grain boundary energy of a metal or alloy is taken as being one-third of the corresponding solid surface energy. 24 ref. (P13h)

443-P.* Nitrogen in Steel. Digest of six papers presented at the Electric Steel Conference, A.I.M.E., Pittsburgh, December 1957. *Metal Progress,* v. 74, July 1958, p. 136, 138, 140, 142.

Calculations showing the maximum solubility in nitrogen of typical N-Mn-Cr steels. Heats of the corresponding analyses were then made and chemical analysis closely checked the predictions.
(P12e, D5; SS, Mn, Cr)

444-P.* Optical Properties of Semiconductors Under Hydrostatic Pressure. Pt. 3. Germanium-Silicon Alloys. William Paul and D. M. Warschauer. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 6-15.

The optical absorption edge of a number of Ge-Si alloys was measured at room temperature as a function of hydrostatic pressure from 1 to 7000 kg. per sq. cm. The pressure variation of the energy corresponding to the edge $(dE/dP)_T$ varies continuously with composition from pure Ge to pure Si. A break in this curve is found between 10 and 20% Si, consistent with an interpretation in which the (100) conduction-band minimum becomes lower than the (111) minimum as Si content is increased. 11 ref. (P17a, 3-74; Ge, Si)

445-P.* Constitution and Magnetic Properties of Iron-Rich Iron-Aluminum Alloys. A. Taylor and R. M. Jones. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 16-37.

Constitution of high-purity Fe-Al alloys over the composition range 0-62 at.% Al investigated, primarily by X-ray diffraction methods. New lattice-parameter data were obtained. Diffraction patterns taken at elevated temperatures show that the phase diagram needs correction in the region of Fe_3Al, along with the further addition of a sloping transformation boundary beyond 18% Al. Alloys in the composition range 18-33% Al undergo a classical phase change and, on heating, pass successively from the Fe_3Al type of atomic ordering to the FeAl type. 49 ref. (P16, M24b, N6; Fe, Al)

446-P.* Magnetic Structure of Fe_3Al. R. Nathans, M. T. Pigott and C. G. Shull. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 38-42.

A polarized-neutron-beam spectrometer was used to determine the room-temperature magnetic structure of ordered Fe_3Al. Results show that the Al atoms possess no magnetic moment and that the Fe moments differ for the two sublattice sites. Data taken on higher-order magnetic reflections also permitted a comparison of the magnetic form factors for each of the different sites with that of metallic iron. 7 ref. (P16; Fe, Al)

447-P.* Resistivity and Hall Coefficient of Antimony-Doped Germanium at Low Temperatures. H. Fritzsche. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 69-80.

The Hall coefficient R and resistivity p of Ge single crystals containing between 5×10^{14} and 10^{18} antimony atoms per cc. were reinvestigated at temperatures between 1·3 and 300° K. Two different processes of impurity conduction could be distinguished by adding compensating p-type impurities to n-type Ge and investigating the resulting change of p at low temperatures. 32 ref.
(P15, 2-63; Ge, *Sb*)

448-P.* Electrical Resistivity and Thermal Conductivity of Plutonium Metal. Thomas A. Sandenaw and Robert B. Gibney. *Physics and Chemistry of Solids, Journal,* v. 6, July 1958, p. 81-88.

The electrical resistivity of two specimens of high-purity Pu is reported for the temperature range from 26° K. to approximately 780° K. These resistivity measurements give further evidence for the six allotropic modifications of solid Pu found by thermal analysis and dilatometric measurements. Temperature coefficients of resistivity for the various phases are included, as well as indicated phase-transformation temperatures and the heat of transition for the alpha→beta change. 7 ref. (P15g, P11h, N6p; Pu)

449-P.* Electrical Resistivity of Thin Films of Potassium at 100° K. D. G. Worden and G. C. Danielson.

Physics and Chemistry of Solids, Journal, v. 6, July 1958, p. 89-95.

Measured as a function of thickness in the range 148-1600 Å. The experimental results are in excellent agreement with Fuch's theoretical predictions in the range 500-1600 Å and show that the scattering of the electrons at the film surfaces is completely diffuse. Comparison of experimental and theoretical curves gives a bulk resistivity parameter of 1.85 μΩ-cm., a mean free path of 1180 Å, and an electron to atomic density ratio of 1·0. 15 ref. (P15g, 2-63; K, 14-62)

450-P. Measurement of the Thermal Properties of Various Aircraft Structural Materials. P. C. Covington and S. Oglesby, Jr. Southern Research Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131432, Aug. 1957, 71 p. $2.

Thermal properties of a group of metal and plastic structural materials which included honeycomb cores, a foamed-core sandwich panel, a laminated panel and sandwich panels with various honeycomb cores and facing materials. (P12, T24a; 7-59)

451-P. Measurement of Convective Heat and Mass Transfer. A New Approach. R. A. Granville and A. Sigalla. *Iron and Steel,* v. 31, July 1958, p. 355-356.

Simple method of measuring local skin coefficient; relevance to heat and mass transfer phenomena; proposes application of technique to heat and mass transfer problems of iron and steel industry. (P11k, P11j)

452-P. The Water Wettability of Metal Surfaces. Donald J. Trevoy and Hollister Johnson, Jr. *Journal of Physical Chemistry,* v. 62, July 1958, p. 833-837.

Preparatory techniques and contact angles with water reported for seven metals and alloys: Al, brass, Cu, Mg, Ni, SS, and Zn. (P13h; Al, Cu-n, Cu, Mg, Ni, SS, Zn)

457-P. (Russian.) **Residual Magnetization of Nickel and Its Stability.** I. E. Startseva and Ya. S. Shur. *Fizika Metallov i Metallovedenie,* no. 3, 1956, p. 568.

Influence of the preliminary treatment (recrystallizing anneal, oxidizing anneal, and plastic deformation by tension or compression) on the value of I_r of Ni and its stability against alternating magnetic fields, mechanical vibrations and temperature fluctuations. (P16; Ni)

458-P. (Russian.) **Density and Surface Tension of Liquid Commercial Titanium.** V. P. Yelyutin and M. Maupakh. *Izvestiya Akademii Nauk S.S.S.R., Otdelenie Tekhnicheskikh Nauk,* no. 4, 1956, p. 129-131.

Method and results for Ti alloy with 0.1% Fe, less than 0.2% Si, less than 0.1% Ca, and less than 0.5% Mg. At the crystallization temperature the surface tension was equal to 1510 ±18 dyne per cm. (P13h; Ti)

459-P. (Russian.) **Temperature Dependence of Magnetic Susceptibility of Electrons in a Metal.** G. E. Zil'berman and F. I. Itskovich. *Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki,* no. 1, 1957, p. 158-160.

Calculated at limitingly weak magnetic fields over a wide temperature range for hexagonal crystals and Bi. The calculation was carried out for a quadratic dependence of the electron energy on the wave vector. Formulas for susceptibility were obtained for the cases where only small

groups of conductivity electrons exist in K-space; in addition to them, there is a larger electron group; and there is also a larger group of holes. It was found that certain metals have a comparatively simple temperature-dependence of magnetic susceptibility. (P16)

460-P. (Russian.) **Preparation and Study of Intermetallic Compounds in Thin Layers.** V. A. Presnov and V. F. Synorov. *Zhurnal Tekhnicheskoi Fiziki,* no. 1, 1957, p. 123-126.

The electrical properties of binary preparations of the systems Al-Sb, In-Sb and Ga-Sb, obtained by mutual evaporation on glass spoons, were studied in relation to the concentration of the components. The electrical properties of thin layers of AlSb, InSb and GaSb differ strongly from the properties of the bulky forms. Electrical conductivity changes little up to room temperature, but at higher temperatures it quickly decreases. In individual specimens an inversion of the sign of the Hall constant is explained by the advance of the natural conductivity at about 100° because of the small size of the forbidden zone. Alpha increases considerably with rise of temperature. (P15; Al, In, Ga, Sb, 14-62)

461-P. (Russian.) **Experimental Investigation of the Transverse Nernst-Ettinghauser Effect in Tellurium.** I. V. Mochan. *Zhurnal Tekhnicheskoi Fiziki,* no. 6, 1955, p. 1003-1012.

Dependence of the Nernst constant on temperature was experimentally plotted and a maximum at 350° K. was confirmed. Presence of a maximum is due to the occurrence of carriers of opposite sign. (P15g; Te)

462-P. (Russian.) **Electric Conductivity of Germanium-Silicon Alloys in Liquid State.** M. S. Ablova, O. D. Yelpat'yevskaya and A. R. Regel'. *Zhurnal Tekhnicheskoi Fiziki,* no. 6, 1956, p. 1366-1368.

Measured by method of rotating magnetic fields in vacuum at high temperatures. Dependence of the width of the forbidden zone, of the value of the jump in electric conductivity upon melting, and of the maximum electric conductivity in the liquid state on the percentage ratio of the alloy component. (P15g; Ge, Si, 14-60)

463-P. (Russian.) **Heat Conduction of Commercial Materials at Low Temperatures.** N. V. Zavaritskiy and A. G. Zel'dovich. *Zhurnal Tekhnicheskoi Fiziki,* no. 9, 1956, p. 2032-2036.

Thermal conductivity in the range from 2 to 100° K. was measured for copper (annealed and unannealed), Cupalloy (unannealed), Duralimin (unannealed), phosphor bronze (unannealed), "mel'khior" (Cu-Ni alloy)-(annealed and unannealed), manganin (unannealed), stainless steel (unannealed), and graphite. The average heat conduction of these materials was calculated in the ranges from 4.2 to 20.4, 20.4 to 78, and 4.2 to 78°. (P11h; Cu, Cu-b, Cu-s, Ni, SS)

464-P. On the Coercive Force and the Width of the X-Ray Interference Line in Low-Carbon Alloyed Steels. Ya. M. Golovchiner and V. M. Golubkov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 151-154. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Parallel studies of hardness, coercive force and widths of X-ray interference lines after hardening and tempering. The presence of rather difficulty soluble carbides in the steels studied necessitated hardening from 1320-1330° C. Concluded that in the temperature range under investigation the steel remains homogeneous and there is no decrease in the lattice distortion. 4 ref. (P16, Q29n, 2-64; ST)

465-P. Solubility Limit of Certain Alloying Admixtures in Steel. N. S. Fastov and B. N. Finkelshtein. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 200-204. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

The effect of any alloying admixture on the properties of the steel depends substantially on whether it is in the basic solid solution or in the insoluble carbide. Thus it is of great interest to determine the solubility limit of the alloying admixture in the austenite, and also the amounts and the compositions of the carbide phase as functions of the composition of the steel and of its heat treatment. A steel alloyed with vanadium was considered. Two phases of the steel were formed after isothermal soaking, in equilibrium with each other: austenite, alloyed with vanadium and carbide of vanadium. (P12e, N8, ST)

466-P. Thermodynamic Activity of Carbon in Austenite Containing Man-

ganese and Silicon. V. M. Rozenberg and L. A. Shvartsman. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 211-218. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

An equation is proposed for the activity coefficient of carbon in austenite containing Mn and Si which can be used for approximate calculation of the solubility of carbon in austenite at various concentrations of the above elements for a temperature of 1000° C. Estimates were made of the values of heat of solution of carbon in Mn-containing austenite at various concentrations of Mn. 5 ref.
(P12b, P12q; ST, *C, Mn, Si*)

467-P. Properties of Ternary Alloys of the Diborides of Titanium, Chromium and Zirconium. K. I. Portnoi and G. V. Samsonov. *Doklady Akademii Nauk SSSR*, v. 116, no. 6, 1957, p. 976-978. (Henry Brutcher, Altadena, Calif., Translation no. 4273.)

Variation of microhardness, lattice constant and electrical resistivity of an equimolar mixture of Ti and Cr diborides when Zr diboride is alloyed with it. Solubility of ZrB_2 in the binary boride and of the binary boride of ZrB_2.
(P15g, M26, Q29n; Cr, Ti, Zr, B)

468-P. (Czech.) **Magnetization Curves of Thin Layers of Iron.** Karel Zaveta. *Ceskoslovenska Casopis Fiziki*, no. 3, 1956, p. 303-312.

Magnetization curves of layers measuring from 125 to 7870 Å obtained by evaporation in vacuum. A torsion magnetometer was used. The curves showing the magnetization work and the corresponding residual magnetization versus the thickness display an anomoly in the 1100 Å thickness range. It was shown by weighing that the density of the layer is less than the density of the metal. (P16; Fe, 14-62)

469-P. (Czech.) **Structure of Domains in Polycrystalline Materials. Pt. 2. Domains on Planes Making a Small Angle With (110).** Ladislav Spacek. *Ceskoslovenska Casopis Fiziki*, no. 3, 1956, p. 313-323.

Magnetic structure of polycrystalline iron with particular attention to the (110) surface. which is rotated somewhat relative to the [110] axis and the grinding plane. Domain structure is observed in individual crystals as a function of angle of inclination. Preparation of specimens, effect of mechanical and electrolytic polishing on domain structure, and action of anisotropic etching. Connection between domain structure and crystallographic orientation. (P16c; Fe)

470-P. (Russian.) **Hydrogen Adsorption of Nickel Layers Condensed in Deep Vacuum.** N. N. Kavtaradze. *Doklady Akademii Nauk SSSR*, no. 4, 1957, p. 822-825.

The adsorption of H_2 on Ni layers prepared by sublimation in vacuum was studied at temperatures from 195 to 100° and under pressures from 10^{-6} to 4×10^{-2} mm. of Hg. Shown that H_2 adsorption on Ni, Fe, Cr and Pt consists of a reversible and an irreversible part. The reversible part strongly depends on the pressure and the temperature; the irreversible part strongly depends basically on the temperature.
(P13d; Ni)

471-P. (Russian.) **Optical Properties of Polycrystalline Layers of Cadmium Selenide.** Vishchakas Brazdzhunas. *Lietuvos TSR Mokslu Akademija Darbai, Sbornik an Lit S.S.S.R.*, 1956, p. 21-33.

Investigation of the absorption, reflection and refraction of thin polycrystalline layers of cadmium selenide in the spectral region from 0.23 to 1.34 microns. The thickness of the layers varied from 0.1 to 3 microns. The absorption constant was determined with allowance for the reflection. On the edge of the band of intrinsic absorption, at 0.7 micron, there was observed a slight maximum of absorption, whose position corresponds to the position of the maximum of the photosensitivity of the layers. (P17; 14-62, Cd)

472-P. (Russian.) **Electroconductivity and Thermo-EMF of Intermetallic Compound SbZn.** M. V. Kot. *Ucheni Zapiski Khurkovsky Universitet*, no. 24, 1956, p. 11-18.

Electroconductivity and thermo-emf. of alloys of Zn and Sb containing 48 to 65 at. % Zn were measured in the range of 250 to 625° K. The width of the forbidden zone of the compound ZnSb was 0.6 ev. (P15g; Zn, Sb)

473-P. (Russian.) **The Curie Point in Thin Films of Ferromagnetics.** A. S.

Mil'ner and N. L. Polyakova. *Ucheni Zapiski Kharkovsky Universitet,* no. 64, 1956, p. 159-165.

Experimental verification of the dependence of the Curie point on the thickness of Ni films. Films are obtained by evaporation in vacuum on glass from a Ni wire or from a crucible made of Al oxide. Curie point was measured from the relative change in the magnetic moment of the film upon increase in temperature. The Curie temperature is independent whether the Ni is coated on cold or hot glass. The irreversibility of the first magnetization curve, its dependence on the speed of heating, and the increase in the magnetic moment at room temperature for Ni films coated on cold glass leads to the conclusion that apparently these films are in an unstable phase. (P16d; Ni, 14-62)

474-P.* On the Electrical Properties of Polycrystalline Boron. Ryosei Uno. *Physical Society of Japan, Journal,* v. 13, July 1958, p. 667-675.

Specimens of boron with various conductivities were studied. Conductivity varies not with impurity content, but with crystal structure. 18 ref. (P15g, 3-71; B)

475-P. (Russian.) **Ratio of Hysteresis to Eddy-Current Losses in Electric Steel.** V. V. Druzhinin and Yu. P. Burdakova. *Electrichestvo,* no. 8, 1956, p. 50-54.

Electromagnetic losses due to hysteresis and eddy-currents as a function of magnetization frequency and amplitude of a.c. induction. Reduction in the total electromagnetic loss, attained in recent years in the better grades of transformer steel, is due to a very sharp reduction in the hysteresis losses. (P16; ST, SGA-n)

476-P. (Russian.) **Investigation of the Change in the Electric Resistivity of Molybdenum Permalloy Under the Influence of Magnetization and Elastic Deformation.** R. G. Anniyev and G. Myalikgulyyev. *Izvestiya Akademii Nauk Turkmenskoi S.S.S.R.,* no. 2, 1956, p. 45-53.

Experimental investigation of longitudinal galvanomagnetic effect in Mo Permalloy (81.09% Ni, 14.9% Fe, 3.2% Mo and 0.81% other admixtures) in the inversion field. Measurements were carried out at room temperature. Curves show dependence of the longitudinal galvanomagnetic effect versus effective magnetic field and elastic force and versus the square of the intensity for both series of specimens. With simultaneous increase of magnetization and of elastic deformation, the value of the magnetization increases, while its electric resistivity decreases. (P15g, P16, 3-68; Ni-b, *Mo*)

477-P. (Russian.) **Determination of the Optical Constants of Germanium.** K. D. Sinel'nikov, I. N. Shklyarerskiy and B. S. Skorobogatov. *Ucheni Zapiski Kharkovsky Universitet,* no. 6, 1955, p. 135-140.

Index of refraction of thin Ge films was measured by the Ge-wedge method, coated in vacuum on glass or on silver. (P17b; 14-62; Ge)

Thermal decomposition of some intermediate compounds such as uranium peroxide, ammonium uranate, uranium and ammonium pentafluoride, uranium tetrafluoride and uranous oxide studied by means of Chevenard's thermobalance. Some data on pyrolysis of synthetic mixtures of intermediate compounds which may occasionally appear during industrial processes. 20 ref. (P12, C-general; U)

479-P.* (English.) **Effect of Tension on the Magnetostriction of Iron Single Crystals.** Hideo Takaki and Jun-ichi Hayashi. *Physical Society of Japan, Journal,* v. 13, July 1958, p. 703-709.

Measured at room temperature by means of strain gage technique. 6 ref. (P16, 3-66; Fe, 14-61)

480-P.* (Russian.) **Influence of Annealing Conditions on Thermal Magnetic Aging of Permanent Magnets.** A. M. Morozova and F. I. Feigina. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 428-433.

Thermal magnetic aging with the aim of increasing magnetic stability. Lengthening of annealing time at 580° C., as well as annealing by stages under special conditions, will increase stability of permanent magnets without changing their coercive force. (P16, X11g, 2-64)

481-P. On Dispersability of Ferromagnetic Separations in Austenitic Alloys, Using Demagnetization Curves. N. I. Eremin. *Metallovedenie i*

Obrabotka Metallov, July 1958, p. 27-30. (Henry Brutcher, Altadena, Calif., Translation no. 4279.)

Domain boundaries do not form in ferromagnetic powder particles possessing strong coercive force. Because of removal of domain boundaries, the usual demagnetization mechanism cannot take place. Changes in magnetization can only take place because of the coherent spins rotating in the strong fields. Study of single domain separations in austenitic steels, within which can be found separations of ferrite, opens up a new field in physical metallurgy. (P16; ST, 6-68)

482-P. (Russian.) **The Nernst Thermomagnetic Effect in Iron-Nickel Alloys.** E. P. Svirina and R. P. Ivanova. *Frizika Metallov i Metallovedeniya*, no. 3, 1956, p. 444-468.

The relationship between the Nernst effect (N) and magnetization was studied on seven specimens of Fe-Ni alloys containing 28-85% Ni. Measurements were carried out in a solenoid producing a field of up to 1250 oersteds and magnetization was determined by the ballistic method. The Nernst e.m.f. was linearly dependent on magnetization, but a break was observed in the curves near saturation. Relationship between Nernst e.m.f. and alloy composition; effect on this relationship of heat treatment for the alloy $FeNi_3$ is tentatively explained by the ordering phenomena in this alloy. (P15g, P16; Fe, Ni)

483-P. (Russian.) **The Nernst-Ettingshausen Effect in Strong Magnetic Fields.** I. M. Tsidil'kovskii. *Zhurnal Tekhnicheskoi Fiziki*, no. 1, 1957, p. 12-22.

Measurements were made on seven specimens of HgSe, made by hot pressing or sawed from cooled melts. The longitudinal, transverse and longitudinal-transverse Nernst-Ettingshausen effects were measured in the range 130-480° K. at field strengths up to 10^4 oersted. Relationship between the Nernst-Ettingshausen effect field and the magnetic field at high field strengths is nonlinear, and shows a maximum, at which it is particularly useful to calculate the carrier mobility. (P15g, P16; Hg, Se)

484-P. (Russian.) **The Equilibrium and Nonequilibrium Properties of Polycrystalline Selenium.** P. T. Kozyrev. *Zhurnal Tekhnicheskoi Fiziki*, no. 1, 1957, p. 35-44.

Equilibrium electrical properties of polycrystalline Se, crystallized at atmospheric pressure and also at high pressure, from amorphous Se. Crystallized Se was brought to equilibrium condition by holding at 100-120° C. for 80-100 hr. and then at 40° C. for 100 hr. Observations were made of the reproducibility of the temperature-equilibrium electrical conductivity curve. With increasing temperature the equilibrium electrical conductivity increases to a certain maximum value and then decreases. (P15g, 2-61; Se)

485-P. (Russian.) **Electrical Properties of the Intermetallic Compound CdSb.** I. M. Pilat. *Zhurnal Tekhnicheskoi Fiziki*, no. 1, 1957, p. 119-122.

The Cd and Sb, after multiple vacuum distillation, had impurity contents $\leq 0.0001\%$. CdSb single crystals were made by fusion, followed by special heat treatment and zone melting. Activation energy is given. It was found possible to obtain high amplification factors, using suitable surface treatments, impurity additions and conditions of compound formation. (P15, Cd, Sb, 14-61)

486-P. (Russian.) **Galvano-Magnetic Properties of Tellurium at Low Temperatures.** S. S. Shalyt. *Zhurnal Tekhnicheskoi Fiziki*, no. 1, 1957, p. 189-204.

Studies of variation with temperature of the electrical conductivity of Te between 100° C. and 1.3° K., of the Hall constant and the change in resistivity in magnetic fields up to 26,000 oersteds at room temperature and at liquid N_2 and He temperatures. Attempts at theoretical interpretation of the experimental data. (P15g, P16, 2-63; Te)

487-P. (Russian.) **Excitation of Atoms of Semiconductors in Multi-Electronic Models.** S. V. Vonsovskii and A. N. Kushnirenko. *Fizika Metallov i Metallovedenie*, v. 5 no. 5, 1957, p. 395-401.

11 ref. (P15g; EG-j)

488-P. (Russian.) **Magnetic Properties of Magneto-Anisotropic Specimens of Ferromagnetic Powder.** E. V. Shtol'ts, Ya. S. Shur and G. S. Kandavrova. *Fizika Metallov i Metallovedenie*, v. 5, no. 5, 1957, p. 412-420.

7 ref. (P16; 6-68)

489-P. Enthalpy and Heat Capacity From 0° to 900° C. of Three Nickel-Chromium-Iron Alloys of Different Carbon Contents. Thomas B. Douglas and Ann W. Harman. *National Bureau of Standards, Journal of Research,* v. 60, June 1958, p. 563-568.

The enthalpy relative to 0° C. of three alloys measured at nine temperatures from 100 to 900° C. by a precise "drop" method. Results are almost independent of the several variations in prior heat treatment investigated and the heat capacity temperature curves of the three alloys are almost coincident, but there is a marked shift in each curve within the interval 500 to 600° C. 7 ref. (P12r; Ni, Cr, Fe)

490-P. (Russian.) Investigation of the Temperature Dependence of Heat Conduction, Electric Conductivity, and Specific Heat of Bi and Pb in a System of Bi-Pb Alloys. V. Ye. Mikryukov and N. A. Tyapunina. *Fizika Metallov i Metallovedeniye,* no. 1, 1956, p. 31-41.

Heat conduction and electric conductivity measured by the Kohlrausch method. Alloys of 22 different concentrations were investigated at temperatures to 242° C. (P11h, P15g, P12r, 2-61; Bi, Pb)

491-P. (Russian.) Study of Magnetization Processes in Silicon Iron by the Powder Figure Method. V. R. Abel's. *Fizika Metallov i Metallovedeniye,* no. 3, 1956, p. 562-563.

Magnetization process studied in Si-Fe (4% Si) crystals with various surface crystallographic orientations, in differently oriented magnetizing fields and for various specimen tnicknesses (0.005-0.3 mm.). Using the powder figure method the magnetic structure of the crystals and its changes under the influence of the magnetic field were studied. (P16; Fe, *Si,* SGA-n)

492-P. (Russian.) Investigation of the Change in the Electric Resistivity of Molybdenum Permalloy Under the Influence of Magnetization and Elastic Deformation. R. G. Anniyev and G. Myalikgulyyev. *Izvestiya Akademii Nauk Turkmenskoi SSR,* no. 2, 1956, p. 45-53.

Investigation of the longitudinal galvano-magnetic effect in Mo permalloy (81.09% Ni, 14.9% Fe, 3.2% Mo and 0.81% other admixtures) in the inversion field.
(P15g, P16; Ni, *Mo,* SGA-n)

493-P. (Russian.) Electroconductivity and Thermo-EMF of Intermetallic Compound SbZn. M. V. Kot. *Uchenye Zapiski Kishinevsk, Universiteta,* no. 24, 1956, p. 11-18.

Measured for alloys of Zn and Sb containing 48 to 65 at. % Zn in the range 250 to 625° K. Width of the forbidden zone of the compound ZnSb was 0.6 ev.
(P15, 2-63; Sb, Zn)

494-P. (Russian.) Temperature Dependence of Magnetostriction of Ferromagnetic Alloys. D. I. Volkov, V. I. Chechernikov and V. B. Tseytlin. *Vestnik Moskovskogo Universiteta,* no. 2, 1956, p. 21-28.

Study of alloys with a Ni-base (Ni-Cu, Ni-Co, Ni-Mn and a Ni-Fe alloy with 45% Ni) in the temperature region close to the Curie point. (P16b, 2-61; Ni-b)

495-P.* The Effects of Irradiation on Magnetic Materials. D. I. Gordon, R. S. Sery and R. E. Fischell. *Engineers' Digest,* v. 19, July 1958, p. 303-304, 318. (From *Nucleonics,* v. 16, June 1958, p. 73-77.)

A 3.5% silicon iron, Orthonol, two molybdenum Permalloys, vanadium Permendur, 16 Alfenol and nickel-ferrite studied. 6 ref.
(P16; 2-67, Fe, Al, Mo, Ni, Si, SGA-n)

496-P. (Russian.) Thermo-Electric Properties of the Compound $CrSb_2$. N. Kh. Abrikosov and V. F. Bankina. *Doklady Akademii Nauk SSSR,* no. 4, 1956, p. 627-628.

Electric conductivity and thermal emf. of Cr-Sb alloys (Sb 80 to 85%) and temperature dependence of these values for the compound $CrSb_2$ (82% Sb). The alloy with 82% Sb has a single-phase structure and had minimum electric resistivity and a maximum thermal emf. $CrSb_2$ is a chemical compound of the semiconductor type with activation energy of 0.16 and 0.32 ev.
(P15, 2-61; Cr, Sb)

497-P. (Russian.) Change in Thermal Emf. of Metals During Plastic Deformation. N. F. Kunin. *Fizika Metallov i Metallovedeniye,* v. 2, no. 2, 1956, p. 237-243.

The value of the absolute thermal emf. and of the Thomson coefficient are sensitive to a change in the properties of the metal (copper) during plastic deformation. Induced

thermal emf. increases with deformation, and its sign and magnitude are independent of the boundary conditions of the deformation.
(P15, 2-61, 3-68; Cu)

498-P. (Russian.) **Anomaly of Electric Resistance in the Fe_3Si Alloy.** I. G. Gutovskiy and Ya. P. Selisskiy. *Fizika Metallov i Metallovedeniye,* v. 2, no. 2, 1956, p. 375-376.

Electric resistivity of Fe_3Si at high temperatures; temperature region of disordering. Measurements show a strictly linear course of the resistivity vs. temperature curve up to 600°, where a sharp break in the curve was observed and a subsequent slight reduction in the electric resistivity as the temperature was increased to 1100° C.
(P15g, 2-61; Fe, Si)

499-P. (Russian.) **Measurement of Thermal Emf. of Metals of the Copper Subgroup Under the Influence of Plastic Deformation at Various Temperatures.** N. F. Kunin and I. Z. Melamed. *Fizika Metallov i Metallovedeniye,* v. 2, no. 3, 1956, p. 423-427.

For Cu, Ag and Au under 40-50% deformation at various temperatures, the induced thermal emf. is proportional to the magnitude of the relative deformation. Other conditions being equal, thermal emf. diminishes with increasing temperature.
(P15, 2-61, 3-68; Cu, Ag, Au)

500-P. (Russian.) **Electric Properties of Germanium at Super Low Temperatures.** E. I. Abaulina-Zavaritskaya. *Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki,* no. 6, 1956, p. 1158-1160.

Dependence of the electric resistivity of single crystals of Ge on temperature and on the intensity of electric field in the range from 0.15 to 20° K.
(P15, 2-63; Ge, 14-61)

501-P. (Russian.) **Electric Properties of the Intermetallic Compounds CdSb.** I. M. Pilat. *Zhurnal Tekhnicheskoi Fiziki,* no. 1, 1957, p. 119-122.

Electric conductivity and thermal emf. from −180 to +250° C., the rectification of CdSb at the point contact and the triode effect.
(P15, 2-61; Cd, Sb)

502-P. (Russian.) **Effect of Ion Bombardment on the Detecting Properties of Semiconductors.** V. E. Kaganer, A. R. Regel' and O. V. Sorokin. *Sbornik statey Leningradskogo Instituta Tochnoy Mekhanika i Optiki,* v. 18, 1955, p. 126-141.

Influence of ion bombardment on the voltage-current characteristics of a point contact Si, Ge, SiC, PbS and SbZn with tungsten. Ion bombardment carried out with ions of hydrogen, air, oxygen, benzine, tellurium and manganese to obtain p-n and p-n-p junctions on the surface of the crystals. (P15; EG-j)

503-P. (Russian.) **Effect of Chemical Composition on Magnetic Properties of Electrotechnical Iron.** N. N. Zaychikov, R. M. Zheltenkova, O. T. Kondratova, A. F. Korostylev, Yu. Ye. Korotkov, B. I. Mashirin, Yu. N. Mynkin and L. S. Panasyuk. *Trudy Moskovskogo Aviats. Instituta,* v. 60, 1956, p. 4-12.

Effect of grain size and chemical composition on the value of magnetizing force of Armco iron using chemical and metallographic data obtained in regular production shop tests. Correlation coefficient between value of magnetizing force and carbon content was found to be 0.301, and correlation between magnetizing force and the sulphur content was 0.372. Magnetizing force increases with increasing content of C or S. The content of Mn, P, Mi and Cu, does not exert a noticeable effect. The magnetizing force increases with diminishing grain size. (P16, 2-60, 2-59; Fe)

504-P. (Russian.) **Pressure Coefficient of Electric Resistivity of Certain Metals at the Temperature of Liquid Helium.** V. I. Khotkevich. *Uchenye Zapiski Khar'kovsk. Universiteta,* v. 64, 1955, p. 151-152.

Ag, Cu, Au, Pt and Pb were placed under pressure of 4000, 6900, 1800, 6900 and 1400 at. respectively. The first four were investigated at the temperature of liquid helium. Lead was investigated at the temperature of liquid hydrogen.
(P15g, 2-63, 3-74; Ag, Au, Cu, Pt, Pb)

505-P. (Russian.) **Technique for Measurement of the Relative Magnetic Viscosity of High-Coercivity Alloys.** B. V. Getling. *Zavodskaya Laboratoriya,* v. 23, no. 1, 1957, p. 42-48.

Apparatus consists of a ballistic galvanometer, a magnetizing device, a magnetic two-pole contactor with pushbutton stations, an electronic time relay of the relaxational type,

a magneto-electric oscillograph and a power pack. Magnetic viscosity of specimens was studied by following the time decay of residual inductance. Method was used for studying the magnetic viscosity of Fe-Ni-Al alloys with different Fe contents, and different heat treatments. (P16, X26; Fe, Ni, Al)

506-P. (Russian.) **Electric Properties of InSb.** D. N. Nasledov and A. Yu. Khalilov. *Zhurnal Tekhnicheskoi Fiziki,* v. 26, no. 1, 1956, p. 6-14.

Investigation on monocrystalline and polycrystalline specimens of InSb of stoichiometric composition with excess of In or Sb (approximately 0.1%). Hall effect, change of resistance in the magnetic field and electric conductivity.
(P15; In, Sb)

507-P. (Russian.) **Thermo-Electric Properties of Cd-Sb Alloys.** V. A. Yurkov and N. Ye. Alekseyeva. *Zhurnal Tekhnicheskoi Fiziki,* v. 26, no. 4, 1956, p. 911-912.

A null method was used to measure the thermal emf. of Cd-Sb alloys relative to Cu for concentrations of 0-100% Sb at junction temperatures of 10 to 100° C.
(P15; Cd, Sb)

508-P. (Russian.) **Electrical Properties of Bismuth. Pt. 2. Electrical Properties of Bismuth Selenide. Pt. 3. Electrical Properties of Bismuth Telluride.** P. P. Konorov. *Zhurnal Tekhnicheskoi Fiziki,* v. 26, no. 7, 1956, p. 1394-1405.

Electrical conductivity, Hall constant and coefficient of thermo-electric emf. of polycrystalline and single crystal samples of Bi_2Se_3 investigated over the range 20-700° K. and occasionally at liquid air temperatures. Same measurements on Bi_2Te_3. (P15, 2-63; Bi, *Se, Te*)

509-P. Measurement of Surface Tension at the Boundary Between Superconducting and Normal Phases. Iu. V. Sharvin. *Soviet Physics JETP,* v. 6, June 1958, p. 1031-1032. (Translation by American Institute of Physics.)

Surface tension between superconducting and normal phases determined by measuring the period of a simple laminar structure, obtained in a flat sample located in an inclined magnetic field.
(P15g, P13h; Sn)

510-P. Determination of Vapor Tension of Solid Cobalt in Iron Using Radioactive Isotopes. Yu. V. Kornev and V. N. Golubkin. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 299-311. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Data were obtained on the vapor tension of cobalt in the temperature range from 1050 to 1250; the heat of sublimation at the same temperatures; the ratio of the self-diffusion activating energy to the binding energy. 19 ref.
(P12c, P13, N1d; Co, Fe, 1-59)

Effects of high energy radiation on metals from theoretical and practical viewpoints. Four particle-metal interactions described. 23 ref. (P-general, Q-general, 2-67)

533-P.* Note on the Rate of Evolution of Hydrogen at a Magnesium Anode. J. H. Greenblatt. *Canadian Journal of Chemistry,* v. 36, Aug. 1958, p. 1138-1140.

Mechanism of anodic dissolution of Mg reviewed. Temperature dependence of rate of hydrogen evolution at Mg anodes during electrolysis. 10 ref. (P15; Mg, *H*)

534-P.* Electrical Conductivity of Manganese Arsenide and Antimonide. Gaston Fischer and W. B. Pearson. *Canadian Journal of Physics,* v. 36, Aug. 1958, p. 1010-1016.

Conductivity determined for MnAs and MnSb from 40 to 200° C.; ferromagnetic, paramagnetic states studied. 11 ref. (P15g; Mn, As, Sb)

535-P.* Neutron Bombardment of Reactor Metals. Robert S. Barnes. *Times Review of Industry,* v. 12, Aug. 1958, p. 20-21, 24.

Effect of bombardment on reactor construction materials and fuel elements; change in properties, dimensions, gas evolution. (P18, T11)

536-P. Influence of Elastic Stresses on the Magnetic Properties of the Alloy Vicalloy. Ia. S. Shur, M. G. Luzninskaia and L. A. Shubina. *Physics of Metals and Metallography,* v. 4, no. 1, 1957, p. 40-44. (Translation by Pergamon Institute.)

Influence of unilateral elastic extension and elastic torsion on the magnetic properties of the high-coercivity alloy Vicalloy (12% V, 52% Co, residue Fe). Samples were investigated in the form of wires. Extension leads to an increase in

coercive force of several times and likewise to a growth of the remanent induction. The increase of coercive force obtained is explained by an increase in the anisotropy of single-domain formations on account of the growth of the anisotropic stress.
(P16, Q21; Co, Fe, V, SGA-n)

537-P. Thermomechanical Treatment of Vicalloy. Ia. S. Shur, M. G. Luzhinskaia and L. A. Shubina. *Physics of Metals and Metallography,* v. 4, no. 1, p. 45-52. (Translation by Pergamon Institute.)

Alloy containing 52% Co, 12% V, balance Fe was investigated in the form of cold drawn wires. Thermomechanical treatment consisted in superimposing unilateral tensile stress on the samples at time of annealing, and as a result high coercive force was obtained. This treatment can appreciably alter the magnetic properties, and under certain conditions coercive force can be increased by 25% and maximum magnetic energy by 40-50%. 7 ref.
(P16, 2-64; Fe, Co, V)

538-P. The Dependence of the Magnetic Properties of Metallo-Ceramic Permanent Magnets on Porosity. A. B. Alt'man. *Physics of Metals and Metallography,* v. 4, no. 1, 1957, p. 65-68. (Translation by Pergamon Institute.)

Influence of the porosity of metallo-ceramic permanent magnets made from the alloys Alni, Alnico, Magnico and Cunico on their magnetic properties. Some empirical formulas are advanced, expressing the dependence of the magnitude of the maximum magnetic energy and residual induction of the magnets on the concentration of pores in them. 4 ref.
(P16, P10m; SGA-n, 6-70)

539-P. Influence of Surface Treatments on the Chemical Behavior of Metals. T. P. Hoar. Paper from "Effect of Surface on the Behaviour of Metals", Philosophical Library, 1958, p. 29-40.

Chemical reaction of a metal surface almost always involves the loss of cations and electrons from the metal. Reaction is accelerated by anything that assists the loss of either cations or electrons or both, and retarded or stopped by anything that interferes with such loss. Cation egress is assisted by mechanical removal of any oxide film and by production of dissaray in the metal surface by, for example, abrasion, or other forms of cold work. Cation egress can be retarded by surface treatments giving films that are impervious to cation except at high field strengths. 18 ref. (P13)

540-P.* (French.) **Change in the Specific Mass of Uranium After Cold Working and During Annealing.** Jean-Pierre Mustelier. *Comptes Rendus,* v. 246, June 16, 1958, p. 3347-3350.

Loss of density was noted after cold working. In cold worked specimen subjected to a series of 1-hr. anneals at increasing temperatures, abrupt increase in density, corresponding to recrystallization, occurred at about 450° C. Final anneal of one month at 630° gave specimen almost same density as before cold working. Variations in density are attributed to formation and disappearance of defects (vacancies, interstitial atoms, dislocations) in crystal lattice.
(P10a, 2-64, 3-68, M26s; U)

541-P.* (French.) **Secondary Electronic Emission of Metals Bombarded by Positive Ions.** Georges Slodzian. *Comptes Rendus,* v. 246, June 30, 1958, p. 3631-3634.

Table of coefficients of secondary electronic emission of metals under bombardment by ions of air and argon. Measurements show that these coefficients can vary considerably with the nature and condition of specimen. Bombarding device prevents contamination of target.
(P15k, 1-53)

542-P.* (French.) **Applications of Cold in Metallurgy.** G. de Smet. *Pratique des Industries Mecaniques,* v. 44, June 1958, p. 141-153.

Behavior of metals at low temperature; cooling fluids and equipment; shrink fitting; structural transformations in cold hardened steels; spontaneous hardening; structural and dimensional stabilization of some metals at subzero temperatures; low-temperature ductility tests. 38 ref.
(P-general, Q-general, 2-63, J26q)

543-P. (Russian.) **New Methods for Determining the Heat of Melting and Transformation of Metals.** A. I. Lazarev. *Issledovaniya v Oblasti Teplovykh Izmereniy. Moskva-Leningrad, Mashgiz,* 1956, p. 21-31.

Transformation heat measured by placing two identical hollow specimens, one of which contains the heater, in the chamber of a metallic

block calorimeter, the temperature of which varies linearly with time. To measure the melting temperature, one of the specimens, made of metal having a known specific heat, is made solid. The second specimen is made hollow and the metal having the unknown melting temperature is placed in its cavity. The heat of eutectoid transformation in steel with 0.83% carbon (14.53 cal. per g.) and the melting heat of lead (6.0 cal. per g.) were measured. (P12q, 1-54; CN, Pb)

544-P. (Lithuanian.) **Some Photoelectric Properties of Antimony Trisulphide (Sb_2S_3).** P. P. Brazdzhyunas and M. Mikal'kevichus. *Mokslo Darbai. Vilniaus Valstybinis Universitetas Matemortiokos Fizikos ir Chemijos Mokslu Serijos,* no. 5, 1956, p. 57-68.

A layer of Sb_2S_3 containing an excess of S was obtained by the sublimation of Sb_2S_3 in vacuum. The curve giving the dependence of the photosensitivity on the amount of excess S shows a sharp maximum. The spectral characteristic of the photosensitivity was investigated. (P17; Sb)

545-P. (Russian.) **Optical Properties of Intermetallic Compounds. Zinc-Antimony Compound.** K. D. Sinel'nikov, T. N. Shklyarewskiy and Y. A. Lupashko. *Uchenye Zapiski Khar'kovskogo Universiteta,* v. 64, 1955, p. 141-144.

Determination of specific conductivity, transparency and absorption coefficient of ZnSb films from 350-1500 millimicrons. The optical density in the region of 400 to 1000 millimicrons is independent of the temperature in the range from 20 to 100° C. (P17; Zn, Sb)

546-P. (Ukrainian.) **Viscosity and Structure of Liquid Solutions of Zinc, Cadmium, Tin, Bismuth and Lead in Mercury.** A. Z. Golik and N. A. Ryndich. *Ukrains' kii Fizichnii Zhurnal,* v. 1, no. 2, 1956, p. 170-182.

The viscosity obeys an exponential law in the temperature range under investigation. The energy of activation of viscous flow is a linear function of the concentration. The density diminishes linearly with increasing temperature. (P10f, P10a; Zn, Cd, Sn, Bi, Pb, Hg, 14-60)

547-P.* (French.) **Variations in Length and Density During Charging of Zirconium in Hydrogen.** L. Espagno, P. Azou and P. Bastien. *Comptes Rendus,* v. 247, July 7, 1958, p. 83-86.

Charging in H provokes linear variation in length and density of Zr. These variations are sufficiently pronounced to be easily used for determination of gas content. (P10a, P10d; Zr, *H*)

548-P.* (French.) **Apparatus for Measuring Resistivity at Ambient and High Temperatures. First Applications to the Study of Uranium-Molybdenum Alloys.** J. Bellot, N. Sacovy and J. M. Henry. *Metaux, Corrosion-Industries,* v. 33, June 1958, p. 243-252.

Two apparatuses described, one for measuring resistivity at room temperature, one for measurements up to 1000° C. Transformation kinetics of some U-Mo alloys at room temperature; interpretation of mechanism of return to equilibrium from supersaturated gamma phase. 11 ref. (P15g, N9n, 1-53; U, Mo)

549-P.* (French.) **Some Physical Properties of Gallium Monocrystals Near the Melting Point.** Marc Ernv. *Metaux, Corrosion-Industries,* v. 33, June 1958, p. 253-269.

Preparation of monocrystals; X-ray study of crystal structure. Study of symmetry from 20° C. to melting point (29.75° C.) by means of Laue back reflection patterns showed that Ga crystals belong to orthorhombic system in range from 20 to over 29.5° C. above which point trihedral formed by crystal axes changes orientation. This phenomenon is attributed to pronounced anisotropic expansion or contraction of crystal. Study of anisotropy of electrical resistivity at 20° revealed that speed of propagation of elastic waves varies with direction of propagation; similarly, resistivity varies with direction of current with respect to crystal axes. (To be continued.) (P15g, M26, 2-62; Ga)

550-P. (Russian.) **Thermal and Electric Properties of Alloys of Copper.** V. Ye. Mikryukov. *Vestnik Moskovskogo Universiteta Seriya Matematiki, Mekhaniky, Astronomii Fiziki Khimii,* no. 2, 1956, p. 53-70.

Investigation within a range from room temperature to 600° of electric conductivity and thermal conductivity of Cu to which small amounts of Cr, Ni, Zr, Al, Be and Ta were added. The alloys were

investigated in two states; normalized and tempered after quenching. (P11h, P15g, 2-60, 2-64; Cu-b)

551-P.* (English.) **The Wiedemann Effect of the Binary System of Iron-Aluminum Alloys at High Temperatures.** Yuki Shirakawa, Toru Ohara and Takeshi Abe. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 212-218.

Wiedemann effect at 70 to 700° C. of annealed specimens of Fe-Al alloys containing up to 17% Al. Relation between torsion of specimen and circular field current, longitudinal field strength, temperature and Al content. 4 ref. (P16; Fe-b, Al)

552-P.* (English.) **Theory of the Wiedemann Effect.** Mikio Yamamoto. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 219-239.

Derivation of a general expression for the Wiedemann effect or the torsion angle in a cylindrical rod of ferromagnetic substance fixed at its one end and magnetized by a longitudinal magnetic field parallel to and by a circular field around its rod axis. 16 ref. (P16)

553-P. (Russian.) **Radioactive Isotope Study of the Behavior of Antimony in Electrolytic Copper Refining.** S. G. Filimonova. *Nauchno-Tekhnicheskii Informatsionnyi Byuleten' Leningradskogo Politekhnicheskogo Instituta,* no. 3, 1957, p. 19-31.

Influence of various factors on the inclusion of Sb in electrolytic Cu in the process of refining, using the radioactive isotope Sb^{124}. Sb passes into Cu as the result of discharge of Sb^{5+} ions, which starts at potentials of 0.23 to 0.24 v. The more positive potential of discharge of Sb ions in the process of Cu refining indicates the depolarization at a simultaneous discharge of Sb and Cu ions.
(P15m, C23p, 1-59; Cu, *Sb*)

554-P. (Russian.) **Cathode Polarization on Alloy Formation. Study of Co-Ni Alloys.** V. M. Kochegarov, A. L. Rotinyan and N. P. Fedot'yev. *Trudy Leningradskogo Instituta Imeni Lensoveta,* v. 40, 1957, p. 112-123.

Cathode polarization on simultaneous and separate electrolytic precipitation of Co and Ni studied at various temperatures and various electrolyte concentrations. In case of electrolytic precipitation from a mixed solution, the partial cathode polarization curves for Co precipitation shift to the positive side more sharply than in case of Ni precipitation. Depolarization is caused by formation of a solid solution and super-polarization is caused by difficulties in formation of an overall crystalline lattice.
(P15, N12d, C23; Co, Ni)

555-P. (Russian.) **Internal Stresses in Electrolytic Precipitations of Copper.** A. A. Khonikevich and N. P. Fedot'yev. *Trudy Leningradskogo Instituta Imeni Lensoveta,* v. 40, 1957, p. 133-142.

Influence of an addition of colloid and surface tension lowering substance on the internal stresses in Cu, microhardness and cathode potential. Cu was precipitated from the solution of 250 g. per liter of $CuSO_4 \cdot 5H_2O$ + 50 g. per liter of H_2SO_5 at room temperature.
(P15, Q25h, C23; Cu)

556-P. (Russian.) **Ionization X-Ray Study of Bismuth Telluride Structure.** F. I. Vasenin and P. F. Konovalov. *Zhurnal Tekhnicheskoi Fiziki,* v. 26, no. 7, 1956, p. 1406-1414.

To investigate the nature of the sign inversion of the thermo-emf., an X-ray study near the stoichiometric composition Bi_2Te_3 was carried out. The thermo-emf. was measured before the alloy was pulverized (for preparing samples for X-ray photographing) by the method of compensation. X-ray photographing was carried out with an ionization installation. Two modifications of Bi_2Te_3 were observed.
(P15, M26q; Bi, Te)

557-P. (Russian.) **Study of Cathode Polarization on Electrolytic Precipitation of Nickel-Tungsten Alloys.** T. F. Frantsevich-Zabludovskaya and A. I. Zayats. *Zhurnal Prikladnoi Khimii,* v. 30, no. 5, 1957, p. 723-729.

Cathode polarization from tartaric ammonium electrolytes and structure of Ni-W precipitates studied. The Ni-W alloy separated with considerable depolarization with reference to W and insignificant depolarization with reference to Ni (30 to 60 mv.). The Ni-W alloy is a one-phase solid solution of W in Ni. The alloy lattice is face-centered cubic characteristic of Ni; the higher the W content, the more the

lattice parameters increase.
(P15, N12d; Ni-b, W)

558-P. (Russian.) **Electrolytic Transfer of Carbon in Liquid Iron-Carbon Alloys.** M. A. Rabkin. *Zhurnal Prikladnoi Khimii,* v. 30, no. 5, 1957, p. 791-794.

Electrolytic transfer of C in liquid Fe-C alloys containing 0.72% Mn, 1.88% Si, 0.052% S and 0.074% P studied at 1300 to 1400° C. Carbon varied from 2.74 to 0.008%. A noticeable drop in concentration of C and S from the anode to the cathode took place, when a current of 0.08 to 0.1 amp. per sq. mm. was passing through at a voltage of 2.3 to 3 v. The greater the duration of the action of the electric field, the greater the concentration differences.
(P15; Fe-b, *C,* 14-60)

559-P.* **Photoconductivity in Chemically Deposited Films of Lead Selenide.** D. H. Roberts and J. E. Baines. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 184-189.

Measurements on photoconductive films of lead selenide indicate that a variation of the hydrazine hydrate concentration used in the deposition leads to a variation in the thermal and optical activation energies from 0.27 to 0.60 ev. This is explained by postulating the existence of potential barriers in the film produced by variations in the Fermi energy. 9 ref. (P17, P15; Pb, Se)

560-P.* **Extreme Frequencies of Lattice Vibrations for Disordered Binary Alloys.** G. F. Newell. *Physics and Chemistry of Solids, Journal,* v. 6, Aug. 1958, p. 190-194.

The extreme frequencies of various branches of the spectrum for a binary substitutional alloy can be estimated by using a variational procedure. In particular, the maximum frequency of the optical modes can be determined approximately as a function of the various force constants and the composition. 5 ref. (P17, M26; N10)

561-P.* (English.) **Electrode Potential Behavior of Titanium in Solutions Initially Free From Metal Ions.** E. M. Khairy and M. M. El Khatib. *Egyptian Journal of Chemistry,* v. 1, no. 1, 1958, p. 47-55.

On the basis of experiments with Ti electrodes in unstirred buffer solutions of a pH range 1 to 12 and in the same solutions stirred with N or O, a protective film of TiO_2, covered in its turn with oxygen doublets, is assumed. Potential thought to be governed by a $Ti/Ti^{+++}/TiO^{++}$ system subject to varying overvoltage effects. Stirring with H, subjecting the electrode to reducing action of H and to high vacuum, activates its surface and reduces the potential for pH=O. Antimony plating increases potential. Computed equilibrium constant $^{a}TiO^{++}/^{a}Ti^{+++} = 10^{3}$. 9 ref. (P15m; Ti)

562-P.* (English.) **Electrode Potential Behavior of Titanium in Fluoride Media.** E. M. Khairy and M. M. El Khatib. *Egyptian Journal of Chemistry,* v. 1, no. 1, 1958, p. 65-73.

Behavior of spectrographically pure Ti rods in buffer solutions of pH 2 to pH 12 with dissolved potassium fluoride in varying concentrations. A protective layer of dioxide assumed on the Ti surface. A remarkable attack of the fluoride ions on the layer is thought to take place if they are present in a concentration greater than one mole, forming TiF_6—as well as on the metal, penetrating through pores of the layer and forming Ti^{+++} ions. 6 ref. (P15m; Ti)

563-P.* (English.) **Anodic Behavior of Titanium at Low and High Current Densities With Particular Reference to the Specific Effect of the Fluoride Ion.** E. M. Khairy and M. M. El Khatib. *Egyptian Journal of Chemistry,* v. 1, no. 1, 1958, p. 75-85.

Anodic behavior of Ti subjected to low current densities in buffer solutions of pH 1.81, pH 7.1 and pH 12, and subjected to high current densities in solutions of pH 1.81, pH 7 and pH 10.88 is studied both in the absence and presence of fluoride ions, ranging over a concentration of dissolved KF from 4 to 10^{-2}N. The presence of fluoride ions caused a remarkable corroding effect in acid media. Passivity up to O-evolution was observed over a larger range of current density in the absence of fluoride ions than in the presence of fluoride ions.
(P15; Ti)

564-P. (Czech.) **Temperature Dependence of Thermo-EMF of Gray Sn With Admixtures of Cd.** Petko R.

Kamadziev. *Ceskoslovensky Casopis pro Fysiku,* v. 6, no. 4, 1956, p. 426-430.

The conductivity and thermo-emf. of gray Sn containing 2.8×10^{18} atoms of Cd in 1 cc. were measured in the range from —183 to +10° C. (P15g, 2-61; Sn)

565-P.* (Czech.) **Effect of Heat Treating Magnetic Soft Material in Magnetic Field on Some Magnetic Properties.** Vladimir Havel. *Hutnicke Listy,* v. 13, no. 7, 1958, p. 587-594.

Influence of heat treating in a magnetic field on the maximum permeability of cast steel with 4.8 to 6.5% Si and cold worked sheets containing 3% Si. Holding time near Curie temperature was 6 min. with maximum outside magnetic field of 300 A. per cm. Cooling velocity was controlled. Results showed substantial rise in maximum permeability value after thermomagnetic treatment, in comparison with results after heat treatment. 10 ref. (P16, 2-64; AY, *Si*)

566-P.* (Czech.) **Development of a Ductile Permanent Magnet Alloy.** Zdenek Tischer. *Hutnicke Listy,* v. 13, no. 7, 1958, p. 669-674.

Production of 20% Ni, 20% Fe, 60% Cu alloy. Mechanical and heat treatment to produce desired magnetic properties in isotropic and anisotropic states. Alloy exhibits high ductility, low hardness, good machinability and workability. 13 ref. (P16, Q-general; Cu-b, *Ni, Fe,* SGA-n)

567-P. (Russian.) **Investigation of the Effect of Iodine Impurity on the Physical Properties of Selenium.** M. I. Aliyev. *AzerbSSR elmler Akademii kheberleri, Izvestiya Akademii Nauk AzerbSSR,* no. 5, 1957, p. 9-25.

At low annealing temperatures (60 to 80° C.), an iodine impurity accelerates the crystallization of Se. As the annealing temperature is increased, the influence of the amount of impurity is gradually weakened and at 90° C. there is no difference in the degree of crystallization of pure Se and that with an impurity of iodine. Iodine impurity increases the electric conductivity, which is greatest with an iodine concentration of 0.1%. Iodine decreases the thermal emf., increases thermal conductivity.

583-P.* Effects of Radiation on the Core Components of Nuclear Reactors. C. E. Weber. Paper from "Effects of Radiation on Materials", 1958, Reinhold Publishing Corp., p. 191-212.

Behavior under radiation of fuel elements, poison control elements and structural members; effect of radiation on dimensional stability, physical properties and mechanical properties. Designing reactor components to minimize radiation damage. 27 ref. (P10d, P-general, Q-general, T11, 2-67)

584-P.* Effects of Radiation on Shielding, Moderators, and Auxiliary Components of Nuclear Reactors. Gerhart R. Hennig. Paper from "Effects of Radiation on Materials", 1958, Reinhold Publishing Corp., p. 213-242.

Radiation damage and effect on physical and nuclear properties of shielding, associated nuclear materials, liquid moderators and solid moderators. 53 ref. (P18, T11, 2-67)

585-P.* Bibliography: Effect of Irradiation on Solids. Helen C. Friedemann. Paper from "Effects of Radiation on Materials", 1958, Reinhold Publishing Corp., p. 305-338.

Extensive bibliography lists material published through 1956 on theories considering mechanism of radiation damage and effects of irradiation on properties of metals and other solids. 779 ref.
(P-general, Q-general, 2-67)

586-P.* (German.) **Contraction After Strain Observed on a Steel With 12% Chromium and 1% Molybdenum.** Karl Bungardt, Martin Bauser and Heribert Sychrovsky. *Archiv für das Eisenhüttenwesen,* v. 29, July 1958, p. 415-422.

A steel with 0.15% C, 12.6% Cr and 1.05% Mo was hardened and annealed and then subjected to tests to determine contraction after strain, its influence upon creep properties, relation to time of load application, creep period from which load is released, amount of load and temperature. The contraction after strain follows a logarithmic time pattern before reaching a limit. It is greater in proportion to the amount of stress applied as well as the temperature. 28 ref.
(P10d, Q3; SS)

587-P.* Mechanism of Growth of Uranium on Thermal Cycling in the Alpha Range. S. F. Pugh. *Institute of Metals, Journal,* v. 86, Aug. 1958, p. 497-503.

Growth of wrought U bar during thermal cycling between room temperature and higher temperature in the range arises from the differences in expansion in the axial direction of the grains of the two components of the rolling texture, combined with a change in the mode of plastic deformation in this temperature range. At the upper cycling temperature, the internal stress is relaxed by a thermally activated process. 18 ref. (P10d, 2-61; U)

588-P.* Effects of Radiation on Metals. Michael Ference, Jr. *SAE Transactions,* v. 66, 1958, p. 47-53.

The effectiveness of materials in absorbing radiation; the basic mechanisms of the interaction of radiation and matter—to determine the changes on the mechanical properties of materials; radiation as a convenient and economical source of energy for irradiation of chemical systems. 14 ref.
(P17c, Q-general; 2-67)

589-P.* Physical Constants, Crystal Structure, and Thermodynamic Properties. J. F. Smith. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 133-147.

Crystallography; density, elasticity and hardness; linear coefficient of thermal expansion; melting point

and heat of fusion; vapor pressure, heat of vaporization and boiling point; reported values for temperature dependence of electrical resistivity; emissivity; thermal conductivity and thermal diffusivity. 15 ref. (P-general; Th)

590-P.* Electronic Structure of Thorium Metal. Ted G. Berlincourt. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 148-160.

Experimental data for the electronic specific heat, magnetic susceptibility, Hall effect, electrical resistivity, magnetoresistivity, superconductivity and thermo-electric effect of Th. 21 ref. (P15, P16; Th)

591-P.* Effects of Irradiation Upon Thorium. Frank G. Foote and J. Howard Kittel. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 277-281.

Thorium and high thorium-uranium alloys are resistant to dimensional changes even at high burnups. Other properties, such as hardness, tensile strength and conductivity, show modest changes, but the situation with regard to tensile strength is not clear. 6 ref. (P10d, Q-general, 2-67; Th)

592-P. (Book.) Effect of Surface on the Behaviour of Metals. 1958, 100 p. Philosophical Library Inc., 15 E. 40th St., New York 16, N. Y. 21 sh.

Lectures delivered at Institution of Metallurgists' Refresher Course 1957. Papers are abstracted separately. (P13, Q9)

593-P. (Book.) Effects of Radiation on Materials. J. J. Harwood, Henry H. Hausner, J. G. Morse and W. G. Rauch. 1958. 355 p. Reinhold Publishing Corp., 430 Park Ave., New York 22, N. Y. $10.50.

Experimental approaches to study; effects of radiation on physical, metallurgical and corrosion properties of metals and alloys. Effects on dielectric materials, semiconductors, nuclear reactor components and organic compounds. Papers abstracted separately.
(P-general, Q-general, 2-67)

594-P. Temperature Dependence of Magnetic Properties of Silicon-Iron. C. W. Chen. *Journal of Applied Physics,* v. 29, Sept. 1958, p. 1337-1343.

Permeability, coercive force, remanence and hysteresis and core losses of a 3% singly oriented Si-Fe alloy measured in the range 30 to 700° C. Their temperature dependence is interpreted in terms of either the intrinsic properties of a ferromagnetic or domain theory. The magnetization curve is analyzed on the basis of the crystallographic characteristics of the texture in the material. Domain distribution is discussed at each stage of magnetization. Application of the analysis leads to the establishment of the relationship between the temperature coefficient of permeability and the magnetization processes. (P16, 2-61; Fe-b, *Si,* SGA-n)

595-P.* Thermal Properties of Mobile Defects. Andrew Granato. *Physical Review,* v. 111, Aug. 1, 1958, p. 741-746.

Using simplified models, calculations are made for the contribution of mobile dislocations and small-angle boundaries to the specific heat and thermal resistivity of crystals. The specific heat is found to be proportional to T and T^2, and the lattice resistivity approximately to T^{-n} (where n lies between 3 and 7/2 for the usual range of measurements) and T^{-5} for mobile dislocations and mobile small-angle boundaries, respectively, over a range of low temperatures, but eventually both go to zero in the limit as the temperature approaches zero.
(P12r, P11h)

596-P.* Theory of the Anharmonic Properties of Solids. Edward A. Stern. *Physical Review,* v. 111, Aug. 1, 1958, p. 786-797.

A theory with which one can calculate the anharmonic properties of solids such as thermal expansion, temperature dependence of elastic constants, dependence of elastic constants under stresses, and the deviation of the specific heat from the Dulong-Petit law at high temperatures. The theory is applied to sodium under the assumption of a special force interaction between nearest neighbors only.
(P11g, P12r, Q21e)

597-P.* Quenched Imperfections and the Electrical Resistivity of Aluminum at Low Temperatures. Warren DeSorbo. *Physical Review,* v. 111, Aug. 1, 1958, p. 810-812.

Electrical resistivity of a high-purity Al specimen, having different concentrations of "quenched in" lattice defects is reported for the temperature region 1-20° K. For small and different concentrations of structural impurities, the resistivity follows Matthiessen's rule. The exponential constant, n, in the equation, $p = pi + AT^N$, is equal

to 2.7 for the sample in a well-annealed state. This number increases slightly with an increase in defect concentration.
(P15g, M26s, 2-63; Al)

598-P. Effects of High Temperature on the Performance of Alnico V and Alnico VI Permanent Magnets. W. H. Roberts and D. L. Mitchell. General Electric Co., Atomic Products Div. *U. S. Atomic Energy Commission APEX-384,* Feb. 1957, 90 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Design parameters and limitations of permanent magnets for applications involving high and low temperatures and vibration. Temperature range in the investigation included —70° C. to 600° C., with the emphasis placed on long-time operation at 500° C.
(P16, 2-62; Al, Ni, SGA-n)

599-P.* (English.) **Note on the Magnetic Susceptibility of Dilute Cu-Mn Alloys.** A. J. Dekker. *Physica,* v. 24, Aug. 1958, p. 697-706.

On the basis of a simple model, the following features of the susceptibility of dilute Cu-Mn alloys are discussed: the concentration dependence of the effective Curie temperature in the high-temperature region; the occurrence of a "gradual" antiferromagnetic transition at low temperatures; the concentration dependence of the position and shape of the antiferromagnetic transition. 5 ref. (P16; Cu, *Mn*)

600-P. (Czech.) **Zinc Telluride as a Semiconductor.** Horak Jaromir, Machovec Mojmir and Kosek Frantisek. *Ceskoslovensky Casopis pro Fysiku,* v. 7, no. 4, 1957, p. 361-368.

ZnTe was synthesized in pure nitrogen at 800° C. Conductivity was measured in a temperature range from 0 to 140° C. using a thin Cu-Zn Te-Cu layer. No photoeffect was observed in ZnTe. Thermal emf. was measured with a Cu-ZnTe contact.
(P15g; Zn, *Te,* 14-68)

601-P. (Korean.) **Thermoelectric Emission in the Process of Melting of Metals.** Mak Zo Ik. *Kvazhak ka Kisul',* no. 7, 1955, p. 38-41.

Connection between thermo-electric emission and work function, relationship of work function to crystallographic directions, relationships of thermo-electric emission and work function to temperature. Research into change in thermo-electric emission during melting of metals. (P15k, P12)

602-P. (Polish.) **Effect of Cathodic Hydrogen on the Magnetic Properties of Chromium-Nickel Austenitic Steel.** L. Kozlowski. *Bulletin de l'Académie Polonaise des Sciences, Troisieme Classe,* no. 5, 1957, p. 519-522.

Variation of the magnetic saturation of austenitic steel as a function of time of cathodic polarization. Restoration of magnetic properties and determination of thickness of surface layer encompassed in the variation of magnetic saturation. Results confirm the conclusion that cathodic hydrogen occurs in austenitic steel only in a thin surface layer of several microns.
(P16; SS)

603-P.* (Russian.) **Theory of Absorption Spectra in Solids.** V. A. Trapeznikov. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 8-16.

X-ray absorption spectra in solids, in accordance with the theory proposed by A. I. Kostarev, are conditioned by dispersed electronic waves emitted by nearest surrounding atoms. This phenomenon depends on coordinating force, radius of coordinating atomic shell and on the nature of surrounding atoms. Heat oscillated atoms influence thin layers of atoms in the region of absorption. 13 ref. (P17, M25)

604-P. (Russian.) **Some Features of the Change of Galvanometric Properties in Relation to the Composition of Alloys.** N. V. Grum-Grzhimailo. *Zhurnal Neorganicheskoi Khimii,* v. 1, no. 6, 1956, p. 1361-1367.

On curves of the relationship of Goldhammer effect composition of Co-Ni, Fe-Co, Fe-Ni, Fe-Co-Ni and Fe-Cu-Ni alloys, breaks corresponding to multiple proportions of atomic concentrations are observed. These compositions are taken to correspond with the compositions of chemical compounds present in solid solution. In the system Co-Ni a break in the curve corresponds to the composition $CoNi_3$ but a discontinuous change of the curve corresponds to CoNi. In the system Fe-Co the compounds Fe_4Co_2 and $FeCo_2$ are observed.
(P15, 2-60; Co, Ni)

605-P.* **Magnetic Core Materials.** *Iron Age,* v. 182, Oct. 16, 1958, p. 190-191.

Magnetic materials are the heart of most electrical machinery. They can be divided into two classes, soft and hard. Materials of soft cores are silicon iron, Ni-Fe alloys. Materials of permanent magnets are high-carbon steel; Co, Mo and W alloys; Al-Ni-Co-Fe alloys; Cu-Ni-Co alloys; Ag-Mn-Al alloys; Co-V-Fe iron alloys. Description, special properties, typical applications. (P16, 17-57; SGA-n)

606-P.* Decomposition of Hydrogen Peroxide on Antimony and Bismuth Alloys. P. P. Clopp and G. Parravano. *Journal of Physical Chemistry,* v. 62, Sept. 1958, p. 1055-1059.

Kinetic parameters correlated with changes in the electronic structure of Bi and Sb. 26 ref. (P15, P13c; Sb-b, Bi-b)

607-P.* Interactions of Metals With Their Molten Salts. Pt. 1. The Nickel-Nickel Chloride System. J. W. Johnson, Daniel Cubicciotti and C. M. Kelley. *Journal of Physical Chemistry,* v. 62, Sept. 1958, p. 1107-1109.

Nickel has appreciable solubility in molten nickel chloride. The depression of the freezing point of nickel chloride (1009.1°) by the dissolved metal was measured and a eutectic point found at 977.5° and 9 mole % Ni. Constitution of the solution discussed in the light of the freezing point depression. 7 ref. (P12n, P12s; Ni)

608-P.* Structural Peculiarities of Liquid Alloys in Certain Binary Systems. D. K. Belashchenko. *Academy of Sciences of the USSR, Proceedings,* v. 115, 1957, p. 665-668. (Translation by Consultants Bureau, Inc.)

Viscosity and electrical resistance of Sb-Sn, Cd-Sb, Cd-Cu, Pb-Ti, Bi-Ti and Fe-Ni liquid alloys. (P10f, P15g; Sb, Sn, Cd, Cu, Pb, Tl, Bi, Fe, Ni, 14-60)

609-P.* Determination of the Iron Vapor Pressure Over Austenite. E. Z Vintaikin. *Academy of Sciences of the USSR, Proceedings,* v. 115, 1957, p. 723-725. (Translation by Consultants Bureau, Inc.)

Vapor pressure found to vary inversely with temperature. Varies from straightline curve over austenite, but not over pure iron. 6 ref. (P12c; Fe)

610-P.* Transformation in Ternary Solid Solutions Based on Ni_3Fe. M. P. Ravdel and Ya. P. Selissky. *Academy of Sciences of the USSR, Proceedings,* v. 115, 1957, p. 733-735. (Translation by Consultants Bureau, Inc.)

Change in various physical and magnetic properties as Cu, Cr, Mo, Mn, Si, W, V are added in small amounts to Ni_3Fe alloy. 5 ref. (P-general, M24c; Ni, Fe, *Cu, Cr, Mo, Mn, Si, W, V*)

611-P.* (English.) Radiation Effects in Solids. R. Smoluchowski. *Nuovo Cimento, Supplemento,* v. 7, no. 2, 1958, p. 523-543.

7 ref. (P-general, Q-general; 2-67)

612-P.* (French.) Thin Ferromagnetic Films. Hall Effect in Thin Films of Nickel. G. Goureaux, P. Huet and A. Colombani. *Comptes Rendus,* v. 247, July 16, 1958, p. 189-193.

Principal experimental results concerning Hall effect in thin films of Ni measured at ambient temperature in magnetic field varying from 10 to 35,000 Oersteds located perpendicular to plane of film. Longitudinal feed current is alternate, with frequency of 50 to 2000 Hz. For thicknesses studied, Hall effect is not modified by frequency variations in this range. (P15, P16; Ni, 14-62)

613-P. Superconducting Transition in Aluminum. John F. Cochran and D. E. Mapother. *Physical Review,* v. 111, July 1, 1958, p. 132-142.

(P15g; Al)

614-P. Reflection of Slow Electrons From the Surface of Pure Tungsten and From Tungsten Covered With Thin Films. Pt. 2. D. A. Gordetskii. *Soviet Physics-JETP,* v. 34(7), July 1958, p. 4-9.

Reflection of slow electrons from monocrystalline W and from W crystals on which a layer of W has been deposited by evaporation, under conditions of ultra-high vacuum to insure a clean surface. Anomalous changes occur in the reflection coefficients when thin layers of Ba, BaO and Ba-O are applied to a W single crystal; possible explanation. 20 ref. (P15k, P17a; 14-61, W, Ba)

615-P.* Effects of Cold Work and Quenching on the Magnetic Susceptibility of a Commercial Titanium Alloy. Y. L. Yao. *American Society for Metals, Transactions,* v. 51, Preprint no. 114, 1958, 9 p.

The mean susceptibility of Ti-140A measured at room temperature increases with cold work and quenching. While the annealing of most cold worked and all quenched samples at 300° C. for 4 hr. almost wipes out this increase, the identical annealing of lightly deformed samples may cause a further increase. The anomalous effects of low-temperature annealing may be connected to strain aging. Tentative explanations as to what causes the change of the mean susceptibility have been made and some applications are given. 13 ref. (P16, 2-64, 3-68; Ti-b)

616-P.* (German.) **Viscosity of Cast Iron.** Anton Koniger. *Giesserei*, v. 45, Sept. 11, 1958, p. 549-556.

Describes a viscosimeter, the main part of which is a rotating disk for immersion in the liquid iron. Resistance against rotation exerted by the iron is measured electrically. Fluidity of cast iron increases with the phosphorus content while tensile strength is decreased. (P10f, 1-53, E25p; CI)

617-P. Thermoelectric Power of Dilute Indium-Lead and Indium-Thallium Alloys. W. J. Tomasch and J. R. Reitz. *Physical Review*, v. 111, Aug. 1, 1958, p. 757-764.

(P15; In, Pb, Tl)

618-P. Design Properties of Sinterings. Pt. 1. Nonferrous Alloys. *Precision Metal Molding*, v. 16, Oct. 1958, p. 54-56.

Typical properties of sinterings for design use-density, ultimate tensile strength, elongation, Rockwell hardness—for some 60 Cu-base alloys. (P10a, Q27a, Q29n; Cu-b, 6-72)

619-P. Reactivity of Certain Uranium Oxides With Aluminum. Terminal Report. A. L. Eiss. Sylvania-Corning Nuclear Corp. *U. S. Atomic Energy Commission, SCNC-257*, Feb. 10, 1958, 26 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

The reaction of uranium dioxide with Al studied at 450, 500 and 600° C. In most cases reaction at 600° C. occurred within a few hours, whereas reactions at 500° were hardly observed before a time period of several days. The method of manufacturing UO_2 has a pronounced effect on its reactivity. (P13b; P, Al)

620-P.* (French.) **Energy Spectra of the Secondary Electrons Emitted by a Metal Under the Action of a Beam of High-Speed Ions.** F. Pradal and R. Simon. *Comptes Rendus*, v. 247, July 28, 1958, p. 438-441.

Spectra were analyzed in an electron microscope with the help of a magnetic spectrograph. It is possible to assign to each metal a characteristic temperature of emission. 5 ref. (P15k)

621-P. (Russian.) **Electrical Conductivity of Aluminum.** A. P. Relyaev and R. M. Gol'shtein. *Tsvetnye Metally*, no. 5, 1957, p. 74-78.

Electrical conductivity of Al is influenced by a number of factors such as the degree of deformation and heat treatment conditions, but the decisive factor is the impurity content of the metal. Effect of Fe, Si, Cu, Ti, V and Cr on electrical conductivity of high-purity Al, and also on mechanical properties of Al wire. Electrolytically refined Al, containing 0.0017% Fe, 0.0025% Si and 0.002% Cu, has a specific electrical conductivity at +20° of 38 m/ohm. per sq. mm., which is 57% of that of Cu. (P15g; Al)

622-P. (Russian.) **Effect of Composition of Aluminum-Zinc Alloys on the Magnitude of the Dimensional Changes in Specimens Due to Cyclic Heat Treatment.** A. A. Bochvar and P. K. Novik. *Doklady Akademii Nauk*, v. 112, no. 6, 1957, p. 1041-1042.

Pure Al, pure Zn and Al-Zn alloys were studied. The length of pure Al and Zn specimens increased as a result of cyclic heat treatment in the range 13-340° C., whereas the alloys containing 75-90% Zn decreased in length. A hypothesis is advanced relating to the mechanism of plastic deformation due to cyclic heat treatment and a curve shows the change in length after 60 cycles, as a function of alloy composition. (P10d, 2-64; Al, Zn)

623-P. (Russian.) **Magnet Type Alloys With a Decreased Cobalt Content.** L. M. Germash, A. M. Morogova and M. S. Yanskaya. *Metallovedenie i Obrabotka Metallov*, no. 6, 1957, p. 8-10.

Possibility of decreasing Co content in magnet-type alloy while retaining maximum magnetic energy, remanence and coercive force. A lowering in Co content from 24 to 21% has no substantial bearing on the optimum cooling velocity and does not require the application of

greater magnetic poles in the thermomagnetic treatment.
(P16, 2-60; SGA-n)

624-P. Research on Aluminum Antimonide for Semiconductor Devices. A. Herczog, R. R. Haberecht and A. E. Middleton. P. R. Mallory & Co. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131849, Mar. 1958, 39 p. $1.

Purification and crystal growing techniques for obtaining suitable aluminum antimonide material. Chemical, physical and electrical characteristics of these crystals, techniques for making ohmic contacts and p-n junctions and feasibility of devices such as rectifiers and transistors for operation at 500° C. Difficulties encountered with carbon impurities and ineffectiveness of zone refining techniques to alleviate this problem. From the available material, point contact and grown junction diodes were made which showed rectification up to 200-250° C.
(P15g; Al, 14-68, SGA-r)

625-P.* Anodic Behavior of Nickel. Pt. 1. Effect of Components of Electrolyte. Nelson F. Murphy and Bharat C. Oza. *Virginia Polytechnic Institute, Bulletin*, v. 51, May 1958, 18 p.

Quantitative effects of constituents of electrolyte on the behavior of three Ni anodes. The anode potential and current density at which Ni became passive was found to be a reproducible value that increased as temperature increased. Effect of fluoride ion in destroying passivity of Ni studied quantitatively. The limiting current density was increased by presence of sulphate ion, the magnitude of the increase depending on the concentration of Ni in the solution. Boric acid did not affect limiting current density at low concentration of Ni ion but had appreciable effect at higher Ni concentrations. 13 ref. (P15; Ni)

626-P.* Role of Adsorption in Production and Measurement of High Vacuum. Chikara Hayshi. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 13-26.

Expressions describing effects of adsorption on gas flow in high vacuum on leak detection, on vacuum measurement and on behavior of water vapor and oil vapor in high-vacuum apparatus.
(P13, X-general, 1-73)

627-P.* Utilization of the Surface Tension of Liquid Metals in Making High-Vacuum Seals. Norman Milleron. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 38-41.

Eutectic alloy of Ga, In and Sn molten at room temperature with surface tension of 500 dyn per cm., vapor pressure of 10^{-8} mm. Hg at 500° C. and excellent wetting properties. Alloy can be utilized in valves, motion seals and flanged joints. Using ultrasonic technique, alloy readily wets W, Mo, Ta, SS, Pyrex, quartz and certain ceramics. 5 ref. (P12c, P13h, T7, 1-73; Ga, In, Sb, 14-60)

628-P.* Resistance-Temperature Characteristics of Evaporated Chromium Films. Dorothy M. Hoffman and Jacob Riseman. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 42-46.

Resistance-temperature characteristics of evaporated Cr films studied as a function of thickness. Resistivity ranged from 25 to 100 microhms per cm. corresponding to thickness from 1700 down to 70 Å for films prepared on substrates held at 25, 70 and 250° C.

Manner in which the intensity of magnetization of thin Ni film varies with temperature and film thickness studied with a magnetization hysteresis loop tracer. Films of thickness 35 to 1350 Å studied from approximately 10° K. to room temperature. (P16; Ni, 14-62)

641-P. Polarization Characteristics of Metals in Some Automotive Coolant Materials. M. Levy. Aberdeen Proving Ground. *U. S. Office of Technical Services*, PB 130193, Jan. 1957, 47 p. (Available at Library of Congress, Washington, D. C.—Microfilm $3.30; Photostats $7.80.)

Anodic and cathodic polarization measurements were made of steel-copper couples in tap water and 30% ethylene glycol environments treated with various inhibitor materials. (P15, R10b; ST, Cu)

642-P. Research in Electrical Properties of Intermetallic Compounds. Tien-Shih Liu and Renato Bobone. Horizons Inc. *U. S. Office of Technical Services,* PB 130839, July 1954, 50 p. (Available at Library of Congress, Washington, D. C.—Microfilm $3.30; Photostats $7.80.)

Preparation and electrical measurements of Ni-Al alloys and Ni-Al-Cu alloys in the cubic B region. Measurements show that the locus of minima of the resistivity for the Ni-Al-Cu ternaries is to be found within a strip containing the transition line from non-defect to defect structures. A qualitative explanation of the main features in the electrical behavior of the alloys, based on the Brillouin zone theory. (P15, M24c; Ni, Al, Cu, 14-68)

643-P. Partition of Soluble Carbon in Ti-6Al-4V Alloy. Richard D. Siebel, Richard L. Beck and Leonard E. Olds. Denver University Research Institute. *U. S. Office of Technical Services,* PB 131603, Nov. 1957, 78 p. $2.

Possible means for determining microdistribution of interstitial-type solutes such as nitrogen, oxygen and carbon, particularly in the more complex alloys. A useful method was developed for measuring microdistribution of solutes in alloys. (P12e; C, Ti, *Al, V*)

644-P. Effect of Temperature on the Magnetic Properties of Nickel-Iron Alloys. J. J. Clark and J. F. Fritz. Westinghouse Electric Corp. *U. S. Office of Technical Services,* PB 131799, Dec. 1957, 37 p. $1.

Normal magnetization curves for various temperatures between −60 and +250° C. are presented for six Ni-Fe alloys, together with curves illustrating behavior of saturation induction, remanence and coercivity over this temperature range. A dependence of d-c magnetic properties of Hipernik V and Deltamax alloys on temperature cycling is also reported. (P16, 2-61; Ni, Fe)

645-P.* A Study of the Interface Impedance Characteristics of Seven Commercial Cathode Nickel Alloys. C. D. Richard, Jr., and A. M. Bounds. *Electrochemical Society,* Abstract no. 82, May 1957, p. 192-194.

Alloys chosen were Inco 225, a high-Si active alloy; Inco 220, a low-Si, low-Mg alloy; Inco 330, a low-Si alloy with high Mg; Cathaloy A-30, an Al-Ni alloy; Cathaloy A-31, a W-Ni alloy; Cathaloy A-32, an Al-W-Ni alloy; and Cathaloy P-50, a pure Ni. (P15; Ni-b)

646-P.* (German.) Influence of Annealing Gases on Magnetic Properties of Ferrites. Carl Heck and Joachim Weber. *Archiv für das Eisenhüttenwesen,* v. 29, Aug. 1958, p. 495-504.

On a number of technically important Mn-Zn ferrites the influence of mixing rate, flux, annealing temperature and oxygen contents of annealing gases upon permeability and shape of hysteresis loop is investigated. It was found that annealing in air over too long periods is harmful. 21 ref. (P16, J23; Fe, *Mn, Zn,* SGA-n)

647-P.* (German.) Magnetic Properties of Thin Layers. H. Mayer. *Metalloberfläche,* v. 12, Sept. 1958, p. 257-262.

Study of thin ferromagnetic layers, orientation of magnetic particles, hysteresis loop, magnetic saturation, decrease of the Curie-temperature, increase of coercive force. Facts that can be important in the theory of magnetism as well as in the use of the above layers in electronic computers. 34 ref. (P16; SGA-n)

648-P.* (German.) Soft Magnetic Materials Based on Iron-Silicon-Aluminum Alloys. Gunther Rassmann, Erich Linder and Roland Wittig. *Neue Hütte,* v. 3, June 1958, p. 365-373.

Investigations on the unusual curves of permeability as a function of temperature in Fe-Si-Al alloys resulted in a relationship between composition of material and permeability. The same was found on metal powders, which can be used for magnetic cores of positive, negative or zero temperature coefficient. Sintered parts lend themselves well to applications where formerly only cast material could be used. 8 ref. (P16, 2-61; Fe, Si, Al, SGA-n)

649-P. Properties of Ternary Alloys of Titanium, Chromium, and Zirconium Diborides. K. I. Portnoi and G. V. Samsonov. *Academy of Sciences of the USSR, Proceedings,* v. 116, no. 1-6, 1957, p. 953-955. (Translation by Consultants Bureau, Inc.)

The solubility of ZrB_2 in (Ti, Cr)B_2 is about 40 mole %, and that of (Ti, Cr)B_2 in ZrB_2 is less than 10 mole %. The range of solubility of ZrB_2 in CrB_2 increases on dissolving ZrB_2 in the double borides (Ti, Cr)B_2, with one of the components of which (TiB_2) the zirconium boride forms a continuous series of solid solutions. In the single-

phase region of a solid solution of ZrB_2 in (Ti, Cr)B_2 in samples quenched from 1900°, there is a maximum in the microhardness of 3900 kg. per sq. mm. (at 20 mole % ZrB_2) and in the electrical resistance. 6 ref. (P12e; T, Cr, Zr, 14-68)

650-P.* Optical Properties of Chromium. Robert M. Hill and Charles Weaver. *Faraday Society, Transactions,* v. 54, Aug. 1958, p. 1140-1146.

Refractive index of bulk Cr was measured as 1.18-11.06 for light of wave length 5461 Å. Surface film on a polished bulk metal specimen has a refractive index of 2.42 and a thickness of 50 Å. 13 ref. (P17; Cr)

651-P.* Some Magnetic Properties of Dilute Ferromagnetic Alloys. Pt. 2. B. W. Lothian, A. C. Robinson and W. Sucksmith. *Philosophical Magazine,* v. 3, Sept. 1958, p. 999-1012.

Investigation of Cu-Fe, Cu-Co and Au-Ni alloys. Various magnetic properties; effect of temperature, heat treatment, cold working. 8 ref. (P16; Co, Cu. Fe, Au, Ni)

652-P.* Magnetic Susceptibility of Copper-Nickel and Silver-Palladium Alloys at Low Temperatures. E. W. Pugh and F. M. Ryan. *Physical Review,* v. 111, Aug. 15, 1958, p. 1038-1042.

Susceptibility in range 2.1° to 295° K. is nearly independent of temperature for Ag-Pd alloys, and for Cu-Ni alloys containing up to 27% Ni. (P16q, 2-73; Ag, Cu, Ni, Pd)

653-P.* Variation of Hall Coefficient of Some Non-Ferromagnetic Superlattice Alloys. Kiyoshi Yonemitsu and Takao Sato. *Physical Society of Japan, Journal,* v. 13, Sept. 1958, p. 998-1004.

The temperature dependence of Hall coefficient of five superlattice alloys of Cu_3Pd, CuZn, Ni_3Cr, Au_3Cu and Ag_3Mg was measured to find the effect of order-disorder transformation upon it. 11 ref. (P15p, 1-61, N10; Cu, Pd, Zn, Au, Ag, Ni, Cr, Mg)

654-P. "Pin-Cushion" Irradiation Tests of Uranium and Its Zirconium Alloys. S. H. Paine and F. L. Brown. Argonne National Laboratory. *U. S. Atomic Energy Commission ANL-5538,* July 1958, 41 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

In an irradiation test of U^{235} and U^{235}-Zr specimens in the range 2 to 20% Zr, small pins were mounted in heat transfer blocks, or "cushions", so that surface roughening and length changes could be observed, recorded and compared for five stabilizing heat treatments up to exposure levels of approximately 1% total atom burnup. (P10d, Q-general, 2-64, 2-67; U-b, *Zr*)

655-P. Effect of Burnup of Metallic Fuel Elements Operating at Elevated Temperatures. B. R. Hayward and G. G. Bentle. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/617, 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Materials studied were unalloyed uranium; uranium with ~2.0% Zr; with 1.5% Mo; and 3.0% Mo; and Th with 7.6% U. All these fuels are being monitored during irradiation in the Sodium Graphite Reactor Experiment (SRE). 12 ref. (P10d, Q-general, 2-62, 2-67; U, Th)

656-P. Mechanism of Irradiation-Induced Dimensional Instability of Uranium. L. L. Seigle and L. S. Castleman. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/618, 1958, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Effect of grain size on growth rate; computation of growth rates; effect of temperature; comparison of diffusional and stress relaxation mechanisms. 21 ref. (P10d, 2-67; U)

657-P. Advances in the Physical Metallurgy of Uranium and Its Alloys. H. H. Chiswik, A. E. Dwight, L. T. Lloyd, M. V. Nevitt and S. T. Zegler. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/713, 1958, 35 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Primary impetus placed on the improvement of two essential properties in the utilization of uranium as a fuel-element material—dimensional stability and corrosion resistance. Heat treatment, transformation kinetics and micrographic features of high uranium-base systems which have shown promise in this direction. 47 ref. (P10d, R-general, 2-64, 3-71, T11g, 17-57; U)

658-P. Effect of Irradiation on Fuel Material. J. H. Kittel and S. H. Paine. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1890, 1958, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Although unalloyed U with suitable metallurgical treatment can be subjected to burnups on the order of 2 at.%, damage is severe. The deleterious changes which occur at moderate irradiation temperatures are principally because of surface roughening and anisotropic growth. Certain alloying additions greatly refine the grain size in U, thus eliminating surface roughening. 12 ref. (P10d, M27c, 2-67; U)

659-P.* (Russian.) **Electrical Resistance of Iron, Nickel and Nickel-Copper Alloys at Low Temperatures.** E. I. Kondorsky, O. S. Galkina and L. A. Chernikova. *Zhurnal Eksperimental'noj i Teoreticheskoj Fiziki,* v. 34, May 1958, p. 1070-1076.

Measurements were made in the temperature range 2-78° K. It is believed that the resistance of ferromagnetic metals at low temperatures is related to scattering of electrons or inhomogeneities of the magnetic moment of the lattice.
(P15g, 2-63; Fe, Ni, *Cu*)

660-P.* (Russian.) **Thermal Properties of Superconductors. Pt. 2.** N. V. Zavaritsky. *Zhurnal Eksperimental'noj i Teoreticheskoj Fiziki,* v. 34, May 1958, p. 1116-1124.

Specific heat, thermal and temperature conductivity of Al and Zn measured between 1.5 and 0.15° K. by the temperature wave method. Results compared with measurement of specific heat of other superconductors and with results of microscopic theory of superconductivity. 22 ref. (P11, P12r; Al, Zn)

661-P.* (Russian.) **Surface Resistance of Superconducting Cadmium.** M. S. Khaikin. *Zhurnal Eksperimental'noj i Teoreticheskoj Fiziki,* v. 34, June 1958, p. 1389-1397.

Apparatus which can be used to measure the surface resistance of a metal at a wave length of 3.2 cm. in the super-low-temperature region of about 0.1° K. Total surface resistance of a Cd single crystal is measured in the temperature interval between 0.1 and 0.6° K. Results are analyzed and penetration depth of electromagnetic field in superconducting Cd determined. 17 ref. (P15g; Cd)

662-P.* (Russian.) **Anodic Activation of Chromium and Chromium Steels.** E. I. Antonovskaya and A. M. Sukhotin. *Zhurnal Fizicheskoi Khimii,* v. 32, Aug. 1958, p. 1842-1845.

Anodic potential of Cr diminishes when the pH number of electrolyte increases. Over the range of high anodic potentials, the ratio of Cr and Fe in solution is different from the ratio of these elements as constituents of the steel. Ratio of elements in solution given for steels 1Kh13 and 1Kh25 at different anodic potentials. 5 ref. (P15; AY, *Cr*)

663-P.* (Russian.) **In What Form Is Silicon Present in Liquid Iron?** A. A. Vertman and A. M. Samarin. *Doklady Akademii Nauk SSSR,* v. 120, no. 2, 1958, p. 309-310.

The magnetic susceptibility of melts of the system Fe-Si was measured for 0 to 60% Si and reached a minimum with an assumed content of 34% FeSi. Magnetic susceptibility thought to decrease with increased amount of Si compounds, and to increase with increased amount of free Si atoms present. 11 ref.
(P16; Fe, *Si,* 14-60)

664-P.* (Russian.) **Spin-Lattice Relaxation and Nuclear Magnetic Resonance of Rare Earth Salts.** K. A. Valiev. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 193-202.

Possibility of experimental study of nuclear magnetic resonance of nuclei or paramagnetic ions of rare earth compounds. Experiments conducted at 1.2° K. with Si specimens containing additions of paramagnetic P atoms. Experimental observation of magnetic resonance depends mainly on width of absorption line. In magneto-diluted crystals of rare earth salt ions, the width of the line is determined by the spin-lattice interaction of the ions. 11 ref. (P16f, M26r; EG-g, P, Si)

665-P.* (Russian.) **Electric Conductivity of Ferromagnetic Metals at Low Temperatures. Pt. 2.** E. A. Turov. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 203-213.

Phenomenological observations of interaction of electron conductivity and ferromagnets. Detailed study of electrical resistivity at low temperatures; new experimental data. Solution of corresponding kinetic equation by means of its reduction to equation of diffusion of phase states on Fermi surfaces in area of quasi-impulses. Investigation of ad-

ditional electrical resistivity in ferromagnetic metals related to the diffusion of electrons in ferromagnets. 18 ref. (P15g, N1c, 2-63; SGA-n)

666-P.* (Russian.) **Electric Conductivity of Antiferromagnetic Metals.** Yu. P. Irkhin. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 214-221.

Influence of antiferromagnetic ordering on electric conductivity, analogous to the theory of binary ordered alloys. Main results are contingent on the possibility of splitting the conductance bands by two subbands divided by split energy intervals. Actual experimental data confirm qualitatively the theoretical assumptions. The peculiarities of electroconductivity in antiferromagnetic ordering are also to be observed in semiconductors. 22 ref. (P15g, P16p)

667-P.* (Russian.) **Magnetic Grain Structure in Magnetic Poles of Thin Iron Surfaces Obtained by Electrolysis.** N. V. Kotel'nkov. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 222-228.

The internal stress of ferromagnetic deposits obtained by electrolysis can alter the grain structure. The grain structure of deposited metal is influenced by lining material, machining of the lining surface before deposition, structure of the deposited metal and the magnetic pole. In its effect on grain structure there is a maximum polarity (a critical point). If it is exceeded the grain structure declines. Coating of the magnetic pole in process of deposition on iron improves quality of coating and strengthens its adhesion to the lining (undercoating). 9 ref.
(P16, 3-68; Fe, SGA-n)

668-P.* (Russian.) **Magnetic Properties of Magneto-Anisotropic Objects of Ferromagnetic Powder. Pt. 3.** G. S. Kandaurova, Ya. S. Shur and E. V. Shtol'ts. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 229-236.

Study of anisotropy of magnetized curves and hysteresis of lattice structure in objects of magnetic grain structure. Objects were in form of disks made from Co powder and Mn-Bi. Results showed characteristics of magnetic structures of tiny particles of Co and Mn-Bi alloys (size 1-100 μ). 8 ref. (P16, M26, 3-72; Bi, Co, Mn, SGA-n, 6-68)

669-P.* (Russian.) **Study of Iron-Nickel and Iron-Cobalt Alloys With Frequency Band of 10^5 to 10^7 Cycles.** E. I. Kondarskii and L. G. Smirnova. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 237-246.

Aim was to overcome lack of systematic data on penetrability of magnetic sheet steel. Materials investigated with varying values of constant anisotropy and magnetostriction: Mo-permaloy, Armco iron, and Fe-Co alloys (containing 20, 36, 60 and 72% Co). 10 ref.
(P16q, P16b, 3-72; ST, Co, Fe-B, Mo, Ni, SGA-n, 4-53)

670-P.* (Russian.) **Influence of Decomposition of Super-Saturated Hard Metals on the Hall Effect.** A. V. Cheremushkina. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 268-271.

Influence of diffusion hardening on Hall effect, specific electric resistivity, magnetized saturation and coefficient of force of Fe-W alloys (3.7 to 17.3% W). Conclusions confirm earlier investigations showing existence of a critical concentration as to optimum possible solubility of W in Fe. Exceeding that limit produces no changes in electric resistivity. 7 ref.
(P15p, P15g, P16, 2-60, 2-64; Fe, W)

671-P.* (Russian.) **Influence of Nonuniformity in Steel on Electrical Resistivity During Phase Changes.** N. M. Rodizin. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 315-320.

Heating by an electric current directly without intermediate means makes it possible to heat object with great speed resulting in many practical advantages. It is reflected in the phase changes and in its basic characteristics. It results in an uneven distribution of heat to the various microparticles having varying electrical resistivity. Distribution of heat energy by electric heating of steel depends on form and distribution of microparticles and different electrical resistance.

Heats of formation measured; values of free energy of formation at different compositions and temperatures calculated. 21 ref.
(P12q, P12a; Cs, 14-67)

693-P. Thermodynamics of Phase Diagrams of Binary Systems Involving Compounds. C. Wagner. *Acta Metallurgica*, v. 6, May 1958, p. 309-319.
Formulas are derived to calculate the free energy of formation of a binary compound of virtually invariable composition from the components. 13 ref. (P12a; M24b)

694-P. Thermodynamic Properties of the III-V Compounds InSb, GaSb and InAs. Werner F. Schottky and Michael B. Bever. *Acta Metallurgica*, v. 6, May 1958, p. 320-326.
Free energies of formation, Sb heats of fusion and heats of formation. 21 ref.
(P12q, P12a; In, Ga, Sb, As, 14-68)

695-P. Dilute Solutions in Molten Metals and Alloys. C. B. Alcock and R. D. Richardson. *Acta Metallurgica*, v. 6, June 1958, p. 385-395.
Measurements of activity coefficient of S in Cu, and in binary alloys of Cu with Au, Si, Pt, Co. Fe and Ni at 1100 to 1500° C. 28 ref. (P12h; S, Cu, Au, Si, Pt, Co, Fe, Ni, 2-62)

696-P. Rate of Clustering in Al-Cu Alloys at Low Temperatures. W. Desorbo, H. N. Treaftis and D. Turnbill. *Acta Metallurgica*, v. 6, June 1958, p. 401-413.
Change in resistivity, hardness and other properties of Al-Cu (1-5% Cu) alloys noted at room temperature. Attributed to formation of Cu-rich clusters. Kinetics of clustering investigated. 22 ref. (P-general, Q-general; Al, Cu, 9-69)

697-P. Influence of Plastic Deformation on Expansivity and Elastic Modulus of Aluminum. M. J. Hardon, B. S. Lement and B. L. Averbach. *Acta Metallurgica*, v. 6, June 1958, p. 446-453.
Deformation of polycrystals increases thermal expansion coefficient, decreases elastic modulus, influenced by types of defects in the deformed lattice. 15 ref.
(P11g, Q21a, 3-68; Al)

698-P. Nature of the Interface Between a Solid Metal and Its Melt. J. E. Hilliard and J. W. Cahn. *Acta Metallurgica*, v. 6, Dec. 1958, p. 772-774.

Anomaloy in grain-boundary and solid-liquid interfacial energies for Cu and Ag explained by assuming the interface to be diffused. 8 ref. (P13h, Cu, Ag)

699-P. Heat of Formation of Titanium Tribromide by the Mercury Reduction of Titanium Tetrabromide. Elton H. Hall and John M. Blocher, Jr. *Electrochemical Society, Journal*, v. 105, Jan. 1958, p. 40-44.

7 ref. (P12q; Ti-b, Br, NM-a37)

700-P. Enhanced Surface Reactions. Pt. 2. Oxygen Adsorption on Several Metals. Manfred J. D. Low. *Electrochemical Society, Journal*, v. 105, Feb. 1958, p. 103-105.

Iron, copper, molybdenum, magnesium, aluminum and gold. 9 ref. (P13d, P13b; Fe, Cu, Mo, Mg, Al, Au, O)

701-P. Concentration of Hydrogen in Nickel Under Hydrogen Ion Bombardment. J. Morrison and J. J. Lander. *Electrochemical Society, Journal*, v. 105, Mar. 1958, p. 145-148.

Measured using Ni diffusion tube as cathode in a glow discharge. 4 ref. (P13d, P13b, 1-66; Ni-b, *H*)

702-P. Mechanisms of Hydrogen-Producing Reactions on Palladium. Pt. 5. Deuterium-Palladium System. Sigmund Schuldiner and James P. Hoare. *Electrochemical Society, Journal*, v. 105, May 1958, p. 278-284.

Anodic and cathodic polarization curves for the alpha Pd-D system determined on a Pd bi-electrode. 8 ref. (P13b, M24b; Pd, D, H)

703-P. Cube Oriented Magnetic Sheet—a Major Advance in Magnetic Materials. G. W. Wiener and Klaus Detert. *Journal of Metals*, v. 10, Aug. 1958, p. 507-508.

Magnetic properties of new cube-oriented Si-Fe transformer sheet developed by Westinghouse Electric Corp. (P16, M26c; Fe-b, *Si*, SGA-n)

704-P. Magnetic Properties of Cube Textured Transformer Sheet. J. L. Walter, W. R. Hibbard, H. C. Fiedler, H. E. Grenable, R. H. Pry and P. G. Frishmann. *Journal of Metals*, v. 10, Aug. 1958, p. 509-511.

Magnetic properties of new cube-oriented Si-Fe transformer sheet developed by General Electric Co. 6 ref. (P16, M26c; Fe-b, *Si*, SGA-n)

705-P. Hall Effect and Resistivity fo Porous Copper. E. Goldin and H. J. Juretschke. *Metallurgical Society of AIME, Transactions*, v. 212, June 1958, p. 357-360.

Temperature variation of resistivity, Hall constant, resistivity of Cu prepared by pressing and sintering of fine Cu powder. 7 ref. (P15g, P15p, 2-61; Cu, 6-71)

706-P. Preparation and Properties of Europium. F. H. Spedding, J. J. Hanak and A. H. Daane. *Metallurgical Society of AIME, Transactions*, v. 212, June 1958, p. 379-383.

Melting and boiling point; lattice constant, density, electrical resistivity and its temperature coefficient, and density at 298° K.; compressibility; change of volume on melting; vapor pressure; temperature of thermal linear expansion. 24 ref. (P-general; Eu)

707-P. Processing and Properties of Cobalt Platinum Permanent Magnet Alloys. D. L. Martin. *Metallurgical Society of AIME, Transactions*, v. 212, Aug. 1958, p. 478-485.

Magnetic properties of alloys influenced by composition and heat treatment. Good ductility and machinability. 10 ref. (P16, G17k, Q23p, M24b, 2-60, 2-64; SGA-n, Co-b, *Pt*)

708-P. Activities of Aluminum and Iron in Iron Aluminum Melts at 1600° C. R. D. Pehlke. *Metallurgical Society of AIME, Transactions*, v. 212, Aug. 1958, p. 486-487.

(P12b; M24b, Al, Fe)

709-P. Relationship Between Electrical and Thermal Conductivities of Titanium Alloys. H. W. Deem, W. D. Wood and C. F. Lucks. *Metallurgical Society of AIME, Transactions*, v. 212, Aug. 1958, p. 520-523.

Expression for calculating thermal conductivity from electrical conductivity. 7 ref. (P11h, P15g; Ti-b)

710-P. Activity of Oxygen in Liquid Iron Alloys. T. P. Floridis and J. Chipman. *Metallurgical Society of AIME, Transactions*, v. 212, Aug. 1958, p. 549-553.

Additions of Co, Mo, W, and Pt increase O_2 activity coefficient whereas Cn and Au decrease it. 19 ref. (P12b, 2-60; Fe-b, *Co, Mo, W, Pt, O, Cu, Au*, 14-60)

711-P. Solid Solubility of Phosphorus in Nickel. J. Koeneman and A. G. Metcalfe. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 571-572.
(P12e; Ni-b, *P*)

712-P. Use of Resistivity of Copper at Low Temperatures to Evaluate Purity in Relation to Performance of Copper Oxide Varistors. J. E. Kunzler and J. H. Scaff. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 635-637.
(P15g; Cu)

713-P. Thermoelectric Power of Some Bismuth Alloys. James C. M. Li. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 661-664.
Bi-Ti, Bi-In and Bi-Mg alloys. 25 ref. (P15g, 2-61; *Bi-b,* Ti, In, Mg, 5)

714-P. Occurrence of Oxygen in Cast Iron. Gustaf Ostberg. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 678-686.
Oxygen solubility in cast iron. Equilibria between oxygen, carbon and silicon in molten iron alloys. 19 ref. (P12e, S11r; CI, *O, C, Si*)

715-P. Effect of the Order-Disorder Reaction on the Magnetic Anistrophy and Magnetostriction of Single Crystals of the Ferromagnetic Aluminum-Iron Alloys. R. C. Hall. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 703-706.
19 ref. (P16, N10; Al-b-Fe, SGA-n, 14-61)

716-P. Solubility and Precipitation of Vanadium Nitride in Alpha and Gamma Iron. R. W. Fountain and John Chipman. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 737-748.
Determined by Sievert's technique at 750-1200° C. Activity coefficient of N_2 decreased by V. 29 ref.
(P12e, P12b, N7b; Fe-b, *V, N*)

717-P. Electrical Properties of Cu-Mn-Al-In-Fe and Cu-Mn-Al-In-Ni-Fe Alloys. D. D. Pollock and D. I. Finch. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 841-846.
Resistivity, temperature coefficient and thermo-electric power at room temperature depends on composition. 6 ref.
(P15, 2-60; Cu-b, *Mn, Al, In, Ni, Fe*)

718-P. Stress and Electro-Potential of Copper Wires. K. Nobe, O. K. Miniato and W. F. Seyer. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 884-889.
Emf. measured for a cold worked wire and an annealed wire in sodium chloride and copper sulphate solutions. Emf. varies with stress. 15 ref. (P15g, 3-68; Cu, 4-61)

719-P. Activity Coefficients of MnO and FeO in Openhearth Slags. H. L. Bishop, Jr., N. J. Grant and J. Chipman. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 890-892.
Liquid slags equilibrated with molten carbon-free Fe at 1530-1700° C. Coefficients as function of composition. 6 ref.
(P12b; RM-q, ST-e, *Fe, Mn, O*)

SECTION Q

MECHANICAL PROPERTIES and TEST METHODS; DEFORMATION

1-Q. Mechanical Properties of Uranium-Molybdenum Alloys. M. B. Waldron, R. C. Burnett and S. F. Pugh. *First Nuclear Engineering and Science Congress,* v. 1, 1957, p. 151-162. (CMA)

Properties of 14% Mo alloy were determined up to 800° C. for a variety of heat treatments; hardness; Young's modulus; elongation and age hardening in terms of solid solutions in α and γ-U; γ decomposition yielding two-phase structures; decomposition effect at high temperatures; effect of ordering in the γ-phase. (Q general, 2-67; U, *Mo*)

2-Q. Case Against the Tension Test. John B. Caine. *Foundry,* v. 85, Nov. 1957, p. 86-92.

Examples of catastrophic brittle failures; causes of failure do not include tensile ductility; fatigue strength cannot be evaluated by the tension test; brittle fracture, fatigue fracture, tensile strength are analyzed in relation to steel, nodular, cast and malleable iron. 11 ref. (Q26, Q27, Q7; ST, CI)

3-Q. Mechanical Properties of Zirconium and Zirconium-Uranium Alloys Containing Tin. A. D. Schwope, G. T. Muehlenkamp and W. Chubb. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-770, Sept. 29, 1952, 18 p. (CMA)

Alloys investigated were Zr-2.5Sn, Zr-3.4U and Zr-U-Sn. Tensile tests show that tin had a strengthening effects. In creep tests Zr-2.5 showed high initial deformations but hardly measurable extension afterward when stresses were high. This did not occur when stresses were low. The hot hardness of the Zr-Sn and Zr-U alloys was about the same.
(Q27a, Q3m, Q29p, 2-60; Zr, *U, Sn*)

4-Q. Mechanical Properties and Microstructure of Annealed Zirconium. W. L. Mudge. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-T-46, June 10, 1953, 24 p. (CMA)

Mechanical properties vary with the state of anneal. Hardness was used as an index of annealing conditions. Creep strength and tensile strength are more sensitive to changes of the annealed state than yield strength. 9 ref.
(Q general, 2-64; Zr)

5-Q. Effects of Neutron Bombardment Upon the Properties of Zircaloy-2. M. L. Bleiberg. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-MDM-10, May 19, 1954, 15 p. (CMA)

Property changes in Zircaloy-2 wrought by irradiation in high-temperature water. Electrical resistivity increased 15%, hardness increased 33 DPH, and notch toughness decreased at low temperatures and increased at high. Notch toughness was not a function of fast flux.
(Q29n, Q23s, P15g, 2-67; Zr)

6-Q. Titanium. K. E. Mead. *U. S. Atomic Energy Commission,* AECU-3532, May 13, 1957, 25 p. (CMA)

The properties of Ti-8Mn, Ti-5Al-2.5Sn, Ti-4Mn-4Al and Ti-6Al-4V as well as other titanium alloys. Fabrication, soldering, brazing, welding and costs; tensile and creep properties at high temperatures. Safety precautions against titanium fires, dust and explosions. Properties apparently suffer little damage when subjected to a high total dosage of radioactivity. 12 ref.
(Q general, 2-67, A7p; Ti)

7-Q. Ductility in Beryllium Related to Grain Orientation and Grain Size.

Jacob Greenspan. Nuclear Metals, Inc. *U. S. Atomic Energy Commission,* NMI-1174, Aug. 9, 1957, 39 p.
18 ref. (Q23p, M27c; Be)

8-Q. Effects of Notch Depth and Low Temperature on the Tensile Properties of Titanium. G. W. Geil and N. L. Carwile. *U. S. National Bureau of Standards.* Summary Technical Report 2163, Oct. 1957, 11 p.

Strength and ductility characteristics of annealed, commercially pure titanium. (Q27a, 2-63; Ti-a)

9-Q. Spot-Welded Joints in Titanium Alloys and Their Behavior in Fatigue. W. H. Kearns, W. S. Hyler and D. C. Martin. Wright Air Development Center, Technical Report 54-609. *U. S. Office of Technical Services,* PB 128518, Mar. 1955, 31 p. (CMA)

Tests on sheets of commercially pure titanium, commercial Ti-7Mn, experimental unalloyed Ti and Type-321 stainless. Joints in stainless were slightly better than in Ti, while the latter were significantly better than in clad 24S-T and 75S-T Al. (Q7a; Ti, SS, Al, 7-51)

10-Q. Effect of Hydrogen on the Mechanical Properties of Titanium and Titanium Alloys. G. A. Lenning, L. W. Berger and R. I. Jaffee. U. S. Watertown Arsenal Laboratory, Report 401/79-32. *U. S. Office of Technical Services,* PB 125201, July 1955, 57 p. (CMA)

Notched and unnotched fatigue tests on commercial A-55 and Ti-8Mn indicate that as much as 400 ppm. hydrogen does not significantly alter the fatigue properties. Effect of beta-stabilizing additions on the hydrogen tolerance of alpha titanium alloys; 2% Mo showed the greatest benefit. Hydrogen tolerance for high notch-bend impact properties was increased from about 100 to at least 200 ppm.
(Q7a, Q6n, 2-60; Ti, *H*)

11-Q. Flow Properties, Deformation Textures and Slip Systems of Titanium and Titanium Alloys. F. C. Holden, D. N. Williams, W. E. Riley and R. I. Jaffee. Battelle Memorial Institute, Titanium Metallurgical Laboratory, Report 30. *U. S. Office of Technical Services,* PB 121608, Jan. 1956, 102 p. (CMA)

Methods used to predict formability; flow properties of a number of experimental titanium alloys. The effects of strain transformation, temperature and hydrogen on flow properties. Deformation mechanisms of alpha-titanium at several temperatures, and types of deformation textures. (Q23q, Q24, M26c; Ti)

12-Q. Effect of Impact on Beams and Welded Structural Connections. Paul J. Brennan and Harry A. B. Wiseman. *Welding Journal,* v. 36, Oct. 1957, p. 465s-472s.

Under static and dynamic loading conditions. Timestrain curves are given. (Q6; 7-51)

13-Q. Stress Relieving of Weldments. Earl R. Parker. *Welding Journal,* v. 36, Oct. 1957, p. 433s-441s.

Origin, nature and effect of residual stresses and influences of thermal and mechanical stress-relieving treatments on service performance of welded structures. 23 ref.
(Q25h, J1a, G23; 7-51)

14-Q. (Russian.) **Influence of Titanium and Nitrogen on the Structure and Properties of Welded High-Chromium Thin Sheet Steel.** D. A. Odesskii and V. M. Vozdvizhenskii. *Metallovedenie i Obrabotka Metallov,* no. 9, Sept. 1957, p. 42-46. (CMA)

In the zone adjoining the weld titanium steel presents large grains of ferrite that increase the brittleness of the material, whereas nitrogen steel (especially that containing 2% Ni) is free from this defect, the growth of ferrite grains being prevented by the formation of a continuous film of austenite around the grains. 8 ref.
(Q26s, 2-60, N3; AY, *Cr, Ti, N,* 7-1)

15-Q. (Russian.) **Cold Rolling of Sheet Steel Containing Vanadium or Aluminum for Deep Drawing of Automobile Body Parts.** D. A. Litvinenko, A. A. Rastorguev and V. K. Barzii. *Stal',* v. 17, May 1957, p. 445-449.

Low-carbon rimmed steels with addition of 0.03 to 0.04% V, or killed steels with 0.007% Al, have desirable properties for deep drawing and stamping. They show no draw lines after passing through the die. 4 ref. (Q23q, G4b; AY, 4-53)

16-Q. (Russian.) **Ductility of Cold Rolled Transformer Steel.** A. G. Petrenko, A. V. Smirnova and L. A. Kurtova. *Stal',* v. 17, May 1957, p. 453-456.

Lack of ductility in cold rolled transformer steel is generally caused

by carbide phase particles precipitating around grain boundaries. Repeated annealing at 750 to 850° C. reduces quantity of the carbide phase and increases ductility. 4 ref. (Q23p, N7; AY, SGA-r)

17-Q. Effect of Fretting on Fatigue Characteristics of Titanium-Steel and Steel-Steel Joints. W. L. Starkey, S. M. Marco and J. A. Collins. *American Society of Mechanical Engineers. Preprint 57-A-113,* Aug. 8, 1957, 10 p. 23 ref. (CMA)

(Q7, Q9q; Ti, ST)

18-Q. Instrument for Making Micro-Hardness Measurements at Elevated Temperatures. *Industrial Diamond Review,* v. 17, Sept. 1957, p. 177-178.

Developed by Camstock and Wescott Inc. for Watertown Arsenal. (Q29q, 2-62, 2-53)

19-Q. Micro-Hardness Testing: Experience With the G. K. N. and Other Machines. R. Wall. *Iron and Steel,* v. 30, Nov. 1957, p. 611-612.

(Q29q, 1-53)

20-Q. Frictional Heating and Its Influence on the Wear of Steel. N. C. Welsh. *Journal of Applied Physics,* v. 28, Sept. 1957, p. 960-968.

High frictional temperatures during dry or imperfectly lubricated rubbing of steel produce gross structural changes and intense hardening of surface layers. Protective layer establishes itself more readily as carbon content of steel increases, a feature explained by ease with which eutectoid pearlite transforms to austenite, and thence to martensite, during rapid temperature cycle. By stimulating hot spots during wear by thermal action of electric sparks, hardness change is shown to be intensified by nitrogen or carbon adsorbed from atmosphere or lubricant. 24 ref. (Q9p; ST)

21-Q. Plastic Deformation of Copper and Silver Whiskers. S. S. Brenner. *Journal of Applied Physics,* v. 28, Sept. 1957, p. 1023-1026.

Studied by rapidly reducing stress after yielding. Whiskers exhibit extremely sharp yield points and extensive easy "glide" regions due to propagation of Luder's bands. It is unlikely that sharp yield points are caused by dislocation pinning. Propagation of Luder's bands often becomes obstructed, giving rise to repeated yielding in plastic region. Nature of these obstructions and mechanism of Luder's band propagation are not clear. 8 ref. (Q24; Au, Ag, 14-61)

22-Q. Columbium, Tantalum, Tungsten and Molybdenum. *Materials in Design Engineering,* v. 46, Sept. 1957, p. 85. (CMA)

Tabulated data on physical, mechanical, fabricating and corrosion resistant properties. Applications given. (Q general, P general, R general; Cb, Ta, W, Mo, 17-57)

23-Q. Equipment and Procedures for Rapid Heating and Testing. *Metal Progress,* v. 72, Nov. 1957, p. 97-100.

Advanced electronic equipment is needed to measure and record accurately the temperature and deformation in tests completed in seconds. Rapid heating is done by electrical resistance or in hot fluid. Results vary widely unless test conditions and metallic state are rigidly controlled. (Q general, 1-53, 2-62)

24-Q. Observation on the Distribution of Slip in Polycrystalline Copper. D. S. Kemsley. *Philosophical Magazine,* v. 2, 8th Series, Sept. 1957, p. 1103-1104.

Concentration of slip into bands increases with increasing prior tensile and fatigue deformation. 7 ref. (Q24a; Cu)

25-Q. Velocity of Sound in Metals at High Temperatures. J. F. W. Bell. *Philosophical Magazine,* v. 2, 8th Series, Sept. 1957, p. 1113-1120.

A pulse method of measuring the velocity of sound in thin rods over a wide temperature range, in some cases to the melting point, has been developed. Measurements on Al, brass, Ni, Fe, Pb, solder and Tl show that, in the strain-free condition, the method is a sensitive indication of physical and structural changes. The changes associated with the onset of a liquid phase, the Curie point, order-disorder and other structural changes described. 3 ref. (Q21f, 2-62)

26-Q. (German.) **Relation Between Rockwell C Hardness and Rockwell Hardness at 62.5 KP.** S. Sohrmann. *Fertigungstechnik,* v. 7, July 1957, p. 334-335.

For hardness tests on thin layers (carburized rims or sheets), the depth of penetration using the standard Rockwell-C test is too great. By reducing the test load from 150 kp. to 62.5 kp. satisfactory conditions were obtained. A conversion formula was developed. (Q29e)

27-Q. (German.) **Influence of Additives Upon the Behavior of Brass Under Load and at Elevated Temperatures.** J. Herenguel and M. LeNouaille. *Metall,* v. 11, Aug. 1957, p. 652-655.

Low-phosphorus and Mg additions and to a smaller degree, Cr, add to the strength of brass under heat. These additions help to prevent intercrystalline embrittlement, especially in hot forming. Bi, As and Sb have adverse effects as additives. 5 ref. (Q27, Q26s, 2-60; Cu-n)

28-Q. (German.) **Creep Properties of Soft Solders.** E. Dürrwächter. *Metall,* v. 11, Sept. 1957, p. 740-742.

Several soft solders were subjected to hardness tests, under load for periods up to 30 min. Hardness decreased with increasing time. Additions of Ag and Sb improved the creep properties of pure Sn solders, as did Ag with Cd-Sn solders. Ag does not have any influence on Pb-Sn solders. 6 ref. (Q3, Q29, 2-60; Sn, Cd, Pb, *Ag, Sb,* SGA-f)

29-Q. (German.) **Electrons in the Wear Process.** H. Rörig. *Metall, v.* 11, Sept. 1957, p. 768-769.

Under severe wear conditions surfaces undergo a process of chemical activation, resulting from an emission of electrons. (Q9)

30-Q. (German.) **Mechanical Properties of Hard-Drawn Spring Wire.** Franz Bleilöb and Emil Schücker. *Stahl und Eisen,* v. 77, Oct. 3, 1957, p. 1362-1368.

Minimum values obtainable for reduction of area, shear value at rupture and number of torsions are dependent on wire diameter for classes of mechanical strength provided for. Comparison between configuration of the rupture in torsion and the number of torsion cycles. Coiling and bend test. (Q general; ST, 4-61)

31-Q. (Italian.) **Behavior of Alloy Steels at Subzero Temperatures.** *Nickel,* no. 67, Apr. 1957, p. 1-15.

Effects of subzero temperatures on mechanical properties of steels and influence of some alloying elements, particularly Ni, of hardening and tempering, and of welding. Tabulation of properties at below zero of four En-series steels (23, 24, 25 and 30B) similar in composition to Italian standards.
(Q general, 2-63, 2-64; AY, SS)

32-Q. (Russian.) **Mechanism of Plastic Deformation and Mechanical Properties of Aluminum.** E. S. Yakovleva. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 306-309.

Mechanical properties of Al wire stretcher at rate of 7.3×10^4, 73 and 2.3% and at temperatures of −196, 18 and 250° C., respectively. 9 ref. (Q general; Al, 4-61)

33-Q. (Russian.) **Properties and Structure Changes in Solid Solutions Containing Nickel.** Sh. Sh. Ibragimov and B. G. Livshits. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 315-318.

Changes of microstructure and properties of solid solutions of Ni-Cr and Ni-Cr-Fe due to hot and cold working. Anomalous character of the changes can be explained by diffusion of atoms within the lattice of the solid solution. Kinetics and activation energy of the process. 4 ref. (Q general, M27, 3-68, Ni, SS)

34-Q. (Russian.) **Internal Friction of Pure Metals in Respect to Temperature.** V. S. Postnikov. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 344-351.

Determination of internal friction of Al, Cu, Ni, Fe, Co, Ti, Mo, W, Sn, Pb, Mg, Ag, Au, and Pt, applying method of twisting swings of small amplitude. 13 ref. (Q22, 2-61)

35-Q. (Russian.) **Residual Stresses in Surface Hardened Products After Annealing at the Breakdown Temperature of Martensite.** N. M. Korbin and K. V. Shishokina. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 29-33.

A change in sign (from negative to positive) of the residual stresses takes place in the hardened layer when annealed at the breakdown temperature of martensite. 8 ref. (Q25h, N8p, J23; ST)

36-Q. (Russian.) **Effect of Additions on the Plasticity of Brass No. L62.** A. A. Presnyakov. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 53-55.

Alloy additions and varying temperatures change the plasticity of brass and influence its resistance to tear and deformation. 8 ref. (Q24, 2-60; Cu-n)

37-Q. (Russian.) **Study of Zones of Failure in Creep.** I. L. Mirkin and I. I. Trunin. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 2-7. (Also available as Henry Brutcher Translation No. 3979.)

Microhardness was reduced near the fissure developed by creeping. This may be explained by fine cracks

in the material which have grown out of an accumulation of voids in the crystal lattice along the line of failure. 11 ref. (Q3, M26)

38-Q. (Russian.) **Softening of Metals Subjected to Plastic Deformation.** V. N. Danilov. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 15-16.

The effect of deformation was measured by application of a thermo-electromotive force whose coefficient bears a direct relationship to metal strength, and by measuring microhardness. 9 ref. (Q24, P15, Q29q)

39-Q. (Russian.) **Correlation Between Endurance and Prolonged Stress of Alloys at Elevated Temperatures.** V. A. Parfenov. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 17-23.

Curves of endurance and prolonged stress cross each other when plotted on stress-versus-time to failure coordinates. 10 ref. (Q7a, Q25, 2-62)

40-Q. (Russian.) **Summary of Discussion on Temper Brittleness.** V. D. Sadovsky. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 24-42. (Also available as Henry Brutcher Translation No. 3980 and 4043.)

Temper brittleness appears to be the effect of segregation of the phases in the solid state at the grain boundaries and also within the grains, or mosaic-like blocks resulting from prolonged cooling, or sudden cooling from high temperatures. 58 ref. (Q26s; ST)

41-Q. (Russian.) **Effect of Hydrogen on the Brittleness of Titanium Welded Joints.** S. M. Gurevich. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 47-50.

Within the range of 0.01 to 0.5% hydrogen content brittleness increases with a corresponding decrease in plasticity. 11 ref. (Q26s, 2-60; Ti, *H,* 7-51)

42-Q. (Russian.) **Effect of Surface Conditions of Steel 30KhGSA on Tendency Toward Fatigue.** T. K. Zilova, V. E. Sadovskii and N. I. Demina. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 2-7.

Sensitivity of this steel toward fatigue increases when its surface is hardened either by heat or mechanical treatment. 4 ref. (Q7a; AY)

43-Q. (Russian.) **Influence of Cross Section on the Properties of Alloy ML5.** N. M. Techova and V. A. Blochina. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 16-19.

In samples with annular cross section the rate of decreasing strength at high temperatures is markedly lower than that of smooth samples. (Q27, 2-62)

44-Q. (Russian.) **Properties of Sh X 15 Steels at Low Temperatures.** A. N. Istomina. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 24-27.

Mechanical properties were not greatly affected to −60° C., but at −180° C. their relative compressive strength was considerably lowered. 5 ref. (Q general, 2-63; AY)

45-Q. (Russian.) **Effect of Trimmed Edges on the Properties of Cold Rolled Strip.** P. S. Sacharov. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 43-46.

Trimming causes cold brittleness along the edges of the strip. Removing burr only on one side has little effect, but rounding the edges restores some of the original plasticity. Best results are obtained through heat treatment. (Q26s, F29q; 4-53)

46-Q.* **Cleavage Step Formation in Brittle Fracture Propagation.** J. M. Berry. *American Society for Metals, Transactions,* v. 51, Preprint no. 57, 1957, 44 p.

Some of the metallographic features of brittle fracture propagated at high velocities in single crystals of Si-Fe and a discussion of the three-dimensional geometry of the varied markings observed on the fracture surfaces. 10 ref. (Q26s, Q26n, M27; Fe, *Si,* 14-61)

47-Q.* **Unique Deformation and Aging Characteristics of Certain Magnesium-Base Alloys.** S. L. Couling, J. F. Pashak and L. Sturkey. *American Society for Metals, Transactions,* v. 51, Preprint no. 59, 1957, 20 p.

Certain Mg alloys exhibit unlimited cold rollability. A plot of per cent rolling reduction versus tensile yield strength for these alloys shows the yield strength to reach a maximum at about 15% reduction, and to decrease progressively from this point on with increasing reductions. Aging the cold rolled material at a low temperature raises the yield strength; the greater the rolling reduction, the higher the yield strength on subsequent aging. The deformation mechanism operative in these alloys which accounts

for their unusual property variations is described and the probable aging mechanism discussed. 10 ref. (Q24, N7, F23; Mg)

48-Q.* Effect of Grain Size and Carbon Content on the Yield Delay-Time of Mild Steel. J. M. Krafft and A. M. Sullivan. *American Society for Metals, Transactions,* v. 51, Preprint no. 65, 1957, 31 p.

The delay time for onset of gross yielding after sudden application of constant stress has been measured for mild steels of varied carbon content and grain size. The delayed yield is thought to provide a measure of the upper yield point sufficiently exact to permit a separation of the effects of some of the principal metallurgical parameters upon it. 17 ref. (Q21, 2-60, 3-71; CN)

49-Q.* Temperature and Stress Dependence of the Atmophere Effect on Nichrome V. Paul Shahinian and M. R. Achter. *American Society for Metals, Transactions,* v. 51, Preprint no. 69, 1957.

Creep-rupture tests have been performed in vacuum and air on Nichrome V at a range of temperatures and stresses. While the alloy tends to be stronger in air than vacuum at high temperatures and low strain rates, the reverse is true at low temperatures and high strain rates. 4 ref. (Q3m, 2-61, 3-66; Ni)

50-Q. Compilation of Chemical Compositions and Rupture Strengths of Super-Strength Alloys. *ASTM Special Technical Publication* No. 170-A, 6 p.

Name, nominal chemical composition, characteristic rupture strengths for rupture in 100 and 1000 hr., and patentee for approximately 150 domestic and 75 foreign alloys. Includes ferritic (martensitic) alloys and age-hardening stainless steels. Conventional austenitic stainless steels are not included. (Q3m; SS)

51-Q.* Practical Wear Testing of Cast Iron. R. B. Whitelaw. *Australian Institute of Metals, Journal,* v. 2, Aug. 1957, p. 54-65.

Reviews theories of wear with reference to cast iron, wear testing in the field and by means of laboratory testing machines. Use of Repco wear testing machine and comparison of microstructure, hardness and wear index of various types of cast iron. 12 ref. (Q9, 1-54; CI)

52-Q.* Effect of Prior Strain on the Creep of High-Purity Lead. R. C. Gifkins. *Australian Institute of Metals, Journal,* v. 2, Aug. 1957, p. 66-71.

Effect of small amounts of prior stain on creep at stresses of 400 psi. on vacuum cast and extruded high-purity lead. 19 ref. (Q3, 3-68; Pb-a)

53-Q.* Theories of Metallic Creep. J. M. Summerton. *Birmingham Metallurgical Society, Journal,* v. 37, Sept. 1957, p. 537-552.

Characteristic creep curves, time laws and theories of creep. Note on structural changes during creep. 37 ref. (Q3)

54-Q.* Properties Revealed by Tensile Tests on Pearlitic Nodular Irons. G. N. J. Gilbert and K. B. Palmer. *British Foundryman,* v. 50, Sept. 1957, p. 441-457.

Tensile properties at low, room and elevated temperatures in air, water, mercury and aliphatic hydrocarbons with variations in As, Sn, Si and P content and following normalizing. Variation in ductile to brittle transition and relationship of transition temperature to change in tensile strength and elongation with composition, normalizing and testing medium. Embrittlement at high temperatures. 4 ref. (Q27, Q23r; CI-r)

55-Q.* Influence of Heat Treatment Upon the Impact Properties of Spheroidal Graphite Cast Iron. J. H. Gittus. *British Foundryman,* v. 50, Sept. 1957, p. 466-474.

Specimens of spheroidal graphite cast iron after heat treatment to insure fully ferritic structure were subjected to a series of heat treatments and then tempered at 300, 350, 400 or 450° for 15 min., 30 min., 1 hr., 3 hr. or 24 hr. Impact values and fracture examination demonstrated influence of grain size and tempering treatments on the transition impact characteristics. 17 ref. (Q6n, 2-64; CI-r)

56-Q.* A Comparison of Methods of Assessing Spot-Weld Ductility in Sheet Steels. Pt. I. Experimental Investigation. E. J. French and A. A. Wells. *British Welding Journal,* v. 4, Nov. 1957, p. 514-529.

Theoretical strengths derived from a consideration of idealized welds are compared with experimental results. the cruciform tension test showing a high degree of ductility discrimination lacking in the shear and torsion tests. The ratio of experimental to theoretical tension strength and the tension ratio is

considered as a measure of spot-weld ductility together with other suitable tests. 17 ref.
(Q23p, Q27, 1-54; ST, 7-51)

57-Q.* Effect of Neutron Irradiation on the Mechanical Properties of Molybdenum and Tungsten. M. J. Makin and E. Gillies. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 108-112.

Changes in mechanical properties of stress-relieved Mo and fully recrystallized W after irradiation at 100° C. with 5×10^{19} neutrons per sq. cm. studied at a variety of temperatures; influence of irradiation on the ductile to brittle transition temperature. 14 ref.
(Q general, Q23r, 2-64; Mo, W)

58-Q.* A Compressive Creep Test of Alpha-Uranium Under Neutron Irradiation. H. C. Rose. *Institute of Metals, Journal,* v. 86, Nov. 1957, p. 122-128.

Apparatus designed for measuring compressive creep of U during irradiation in a Windscale pile—in particular, the behavior of alpha-U at 450° C. under a stress of 2.7 tons per sq. in. Irradiation does not appreciably affect the secondary creep rate at this temperature. A transient increase in creep rate, which may be due to thermal cycling, was observed on pile start-up after cooling down between creep runs. 11 ref. (Q3, 2-67; U)

59-Q. A New Way to Select Wear-Resistant Materials. J. R. Driear. *Iron Age,* v. 180, Nov. 21, 1957, p. 121-124.

Wear applications and suggested materials classified according to stress and self-lubrication properties. (Q9n, 17-57; SGA-m)

60-Q. Copper-Base Alloy Compares With Nickel Silver. C. H. Hannon. *Iron Age,* v. 180, no. 21, Nov. 21, 1957, p. 134-136.

(Q general; Cu, *Zn, Al, Ni, Ag*)

61-Q. Analysis of Stresses and Strains Near the End of a Crack Traversing a Plate. G. R. Irwin. *Journal of Applied Mechanics,* v. 24, Sept. 1957, p. 361-364.

Mathematical analysis, stress field near end of somewhat brittle tensile fracture in situations of generalized plane-stress or plane-strain approximated by the two parameter sets of equations—one, an adjustable stress parallel to the direction of crack extension and the other, the stress intensity factor, is proportional to the square root of the force tending to cause crack extension. 10 ref.
(Q25n, Q26q)

62-Q.* Specific Damping Energy of Fixed-Fixed Beam Specimens. W. C. Hagel and J. W. Clark. *Journal of Applied Mechanics,* v. 24, Sept. 1957, p. 426-430.

Internal damping effects of varying composition, heat treatment, cold work, magnetic field strength, stress history and static tension studied at room temperature on AISI 403 steel by fixed-fixed beam specimens supported in new bending vibration-decay apparatus. Experimental logarithmic decrements converted to specific damping energies by straightforward numerical method. 9 ref. (Q22; SS)

63-Q. Three Manganese Alloys Have Useful Thermal and Elastic Properties. John L. Everhart. *Materials in Design Engineering,* v. 46, Nov. 1957, p. 144-146.

Mn-Cu alloys, Mn-Ni-Cu alloys and ternary alloys containing Mn, Fe and 5% of Al, Co, and Ni.
(Q-general, P general; Mn, *Cu, Ni,* Fe, Co, Al)

64-Q.* Flow and Fracture. Earl R. Parker. *Metal Progress,* v. 72, Nov. 1957, p. 65-69.

Today, designers and constructors of advanced machines and structures are often hampered by inadequate materials, a dilemma which can be solved only after acquiring knowledge about crystalline structure at an atomic level. Progress in this line has been sufficient to devise substantial improvements in creep resistance. A ductile ceramic also seems a fairly early possibility. (Q24, Q26, N general)

65-Q.* Physical Properties of Electrodeposited Metals. Pt. 2. T. E. Such. *Metallurgia,* v. 56, Sept. 1957, p. 121-124.

Determination of tensile strength, ductility, hardness and internal stress in electrodeposited metals. 6 ref. (Q general; 8-62)

66-Q. Mechanics of Formation and Machine Shaping of Materials. *Metallurgia,* v. 56, Sept. 1957, p. 134-136.

Plastic flow under combined stresses, behavior of materials under high hydrostatic pressure and effect upon plastic properties of strain rate and temperature. Relation to behavior of metals in extrusion, forg-

ing, or rolling. 6 ref.
(Q23q, Q24, F general)

67-Q.* Hardness and Other Physical Properties of Metals in Relation to Temperature. E. R. Petty. *Metallurgia*, v. 56, Nov. 1957, p. 231-236.

Mode of deformation in the "equicohesive range" used to explain the form of the hardness-temperature relationship for pure metals. A simple correlation between hardness and creep properties is shown for a variety of metals. 38 ref.
(Q29, 2-61, Q3m)

68-Q.* Properties of Materials at High Rates of Strain. K. N. Leibovic. *Metallurgia*, v. 56, Nov. 1957, p. 239-241.

Propagation of stress waves; elastic and plastic strains; effect of high strain rate on yield and fracture; fundamental theory and experiments. 7 ref. (Q25n)

69-Q. Elastic Constants of Magnesium From 4.2° K. to 300° K. L. J. Slutsky and C. W. Garland. *Physical Review*, v. 107, Second Series, Aug. 15, 1957, p. 972-976.

Adiabatic elastic constants of Mg single crystals have been measured by an ultrasonic pulse technique. Values extrapolated have been calculated as well as Debye characteristic temperature at 0° K. Atomic force constants for a central-force model with an electron gas term were also obtained. 17 ref.
(Q21, 2-63; Mg)

70-Q.* Parts Made of Selected High Strength Cast Steels. Robert J. Ely. *Precision Metal Molding*, v. 15, Nov. 1957, p. 39-40, 96-97, 108-109.

Deoxidation practice, melting methods, chemistry and heat treatment of low-alloy martensitic steels. Effect of C, Si and dehomogenization; reproducibility of properties at 180,000 psi. and above.
(Q general, 3-70; AY, SGB-a)

71-Q. Bursting Tests of Zircaloy-2 Tubing. Pt. 1. Preliminary Investigation Using Tubes Machined From Bar Stock. B. R. Price and L. F. Cochrun. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission*, WAPD-FE-749, (no date), 38 p. (CMA)

(Q10b; Zr)

72-Q. Creep Strength of Uranium Alloys at 1500 and 1800° F. H. A. Saller, et al. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-834, May 28, 1953, 30 p. (CMA)

(Q3m; U, *Mo, Zr, Ti*)

73-Q. Effect of Wall Thickness Tolerance on Some Properties and Failure Characteristics of Reference Size Zircaloy-2 Tubing. L. F. Cochrun. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission*, WAPD-FE-1004, Sept. 19, 1955, 9 p. (CMA)

(Q10b; Zr)

74-Q. Laboratory Bend Testing of Zircaloy-2. W. L. Frankhouser. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission*, WAPD-FE-1082, Oct. 18, 1955, 31 p. (CMA)

(Q5; Zr)

75-Q. Hydrogen Migration in Zircaloy-2. B. Lustman. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission*, WAPD-PWR-PMM-1053, Mar. 12, 1957, 14 p. (CMA)

(Q26s; Zr)

76-Q. Neutron Irradiation Effects on the Tensile Properties of Zircaloy-2. R. S. Kemper and D. L. Zimmerman. Hanford Works. *U. S. Atomic Energy Commission*, HW-52323, Aug. 22, 1957, 24 p. (CMA)

12 ref. (Q27a, 2-67; Zr)

77-Q.* Crack Initiation and Propagation in the V-Notch Charpy Impact Specimen. Carl E. Hartbower. *Welding Journal*, v. 36, Nov. 1957, p. 494s-502s.

Easily executed variation in the standard technique permits separation of crack-initiation and crack-propagation stages of the fracture process. The differentiation between ductile and brittle fracture is based on the concept that a brittle-fracture crack is propagated by continuous release of the elastic stress field, whereas a ductile-fracture crack requires plastic deformation to extend the crack. 9 ref.
(Q26, Q6; ST, 7-51)

78-Q.* Relation of Charpy Impact Properties to Microstructure of Three Ship Steels. W. S. Owen, D. H. Whitmore, Morris Cohen and B. L. Averbach. *Welding Journal*, v. 36, Nov. 1957, p. 503s-511s.

Extent to which fracture properties can be accounted for in terms of gross microstructural parameters. The ferrite-pearlite aggregate was varied systematically by means of

annealing and normalizing treatments, and correlations were obtained between several measured microstructural parameters and the Charpy V-notch transition temperature. 22 ref. (Q6, Q26, M27; ST)

79-Q.* X-Ray Diffraction for Residual Stress Measurements of Restrained Weldments. E. H. Kinelski and J. A. Berger. *Welding Journal,* v. 36, Dec. 1957, p. 513s-517s.

Theoretical and experimental studies indicate X-ray diffraction by the two-exposure method to be an excellent tool for the measurement of residual stresses in Monel plate weldments. (Q25h, M22g; Ni, 7-51)

80-Q.* Effect of Specimen Geometry on Charpy Low-Blow Transition Temperature. G. M. Orner and C. E. Hartbower. *Welding Journal,* v. 36, Dec. 1957, p. 521s-527s.

Variation in the standard technique for testing Charpy impact specimens permits a separation of the crack-initiation and crack-propagation stages of the fracture process. The technique requires initiation of a crack by means of a low-energy blow and propagation of the crack by a full-capacity blow of the impact-machine pendulum. Tests show the low-blow transition temperature to be independent of notch and specimen geometry within the limits of notch acuity and specimen size investigated. 9 ref. (Q6, Q26, 1-54)

81-Q.* Studies of the Weld Heat-Affected Zone of T-1 Steel. E. F. Nippes, W. F. Savage and R. J. Allio. *Welding Journal,* v. 36, Dec. 1957, p. 531s-540s.

Slow cooling rates after welding such as may result from either high energy input or high initial plate temperature have a damaging effect upon the notch toughness in the heat affected zone of T-1 steel. 16 ref. (Q23s; ST, 7-51)

82-Q. Micro Hardness Testing. R. Wall. *Wire Industry,* v. 24, Oct. 1957, p. 961.

Procedure and methods of testing wire specimens. Precautions for avoiding errors. (Q29q; 4-11)

83-Q. (Czech.) **Effect of Boron Addition on Properties of Structural Steels.** Vladimir Keclik. *Hutnicke Listy,* v. 12, 1957, p. 696-703.

Results of boron addition to normally killed steel and steel killed by large amounts of Al, Ti or Zr. Boron improves some properties of steel, most notably through hardening. Production difficulties.
(Q general; ST, *B,* AD-q40)

84-Q. (Czech.) **Influence of Residual Austenite in Carburized Layers on Behavior Under Alternating Stresses.** Bohumil Prenosil. *Hutnické Listy,* v. 12, 1957, p. 704-711.

Influence of residual austenite in carburized layers of alloy steels on the endurance limit under alternating stressing; compares endurance limits of specimens in which residual austenite is removed by low-temperature treatment with untreated specimens. 45 ref. (Q7a, N8; ST)

85-Q.* (French.) **Observation of Streaked Stress-Strain Curves in the Case of a Beta'-Matrix Brass.** Henri de Leiris. *Comptes Rendus,* v. 245, Sept. 9, 1957, p. 966-968.

Fluctuations in stress-strain curves may be due to modification of solubility of a second dispersed phase in the beta matrix. 4 ref.
(Q25n; Cu-n)

86-Q. (French.) **Influence of Silicon and Phosphorus on the Temper Brittleness of Malleable Irons.** Paul Bastien, Pierre Azon and Christiane Winter. *Fonderie,* no. 139, Aug. 1957, p. 343-352.

Malleable irons are often protected by galvanization. Subsequent embrittlement comes from the tempering galvanization treatment. Influence of the chemical composition of the iron. 7 ref.
(Q26s, 2-60; CI-s, *Si, P*)

87-Q. (French.) **Several Tests on a Standard Specimen Ingot With Iron Wedge.** *Fonderie,* no. 139, Aug. 1957, p. 363-366.

Shapes of easy to produce specimen ingot investigated. The specimen gives homogeneous characteristics throughout. (Q27, S22; ST, 5-59)

88-Q. (French.) **Mechanical Tests for Cast Irons.** *Machine Moderne,* v. 51, p. 61-66.

Tensile tests; static bending tests; relation between the properties of a cast Fe and its bending resistance; determination of the modulus of elasticity; shear, hardness and pressure tests; machinability.
(Q general; CI)

89-Q. (French.) **Study of Superficial Phenomenon Caused by the Drawing of Openhearth and Electric Steel.** Maurice Vauzelle. *Métaux-Corrosion-Industries,* no. 383-384, July-Aug. 1957, p. 269-285.

Hardness tests, X-ray diagrams and machining tests distinguish hardness variations caused by cold work, texture and internal stress. (To be continued.)
(Q29, G4; ST-e, ST-f)

90 Q. (German.) **Temper Brittleness of Structural Steel.** V. Kraus. *Fertigungstechnik,* v. 7, Aug. 1957, p. 367-372.

Tempering of different steel alloys; time-temperature effects; method for prevention of brittleness. 7 ref. (Q26s; J29; ST)

91-Q. (German.) **Investigation of the Strength of Copper-Titanium and Copper-Zirconium Alloys.** K. Dies. *Metall,* v. 11, Nov. 1957, p. 933-941. (CMA)

5 ref. (Q27a, Q7a; Cu, *Ti, Zr*)

92 Q. (Japanese.) **Effect of Excess Silicon in Aluminum-Magnesium-Silicon Alloys.** Hajime Yamada. *Light Metals,* v. 7, July 1957, p. 45-50.

Excess of Si in low-Mg alloys causes increased hardening, tensile strength, slight increase in electrical resistance and some increase in susceptibility to stress-corrosion. Aging time and corrosion resistance decreased. 3 ref.
(Q general; 2-60; Al, *Mg, Si*)

93-Q. **Abnormal Decay Patterns for Ultrasonic Waves in Metal Rods.** John Awatani and Hiroshi Miyamoto. *Institute of Scientific and Industrial Research, Osaka University Memoirs,* v. 14, 1957, p. 47-52.

Anomaly in decay patterns observed in attenuation measurements is investigated for longitudinal ultrasonic waves in cylindrical rods. Anomaly appears to be due to (1) interference among several modes excited in the rod by a quartz crystal transducer, and (2) residual stresses or fiber structure resulting from production processes. For some materials an appropriate annealing operation can eliminate the second cause. A formula is derived for determining whether or not abnormal decay is due between observed modes. 4 ref.
(Q22f; Al, Si)

94-Q. **Some Properties of Zirconium-Niobium Alloys.** Yu. F. Bychkov, A. N. Rozanov and D. M. Skorov. *Journal of Nuclear Energy,* v. 5, no. 3/4, Pt. II. (Translated by Pergamon Press); also *Soviet Journal of Atomic Energy,* v. 2, no. 2, 1957, p. 402-407. (Translated by Consultants Bureau, Inc.) (CMA)

Previously abstracted from original. See item 513-Q, 1957.

(Translated by Pergamon Press); also *Soviet Journal of Atomic Energy,* v. 2, no. 2, 1957, p. 408-412. (Translated by Consultants Bureau, Inc.) (CMA)

Previously abstracted from original. See item 514-Q, 1957.
(Q21a, 1-54, 2-64; Zr, Cb)

96-Q.* **Improved Formability of Galvanized Sheet.** J. R. Kattus. *Metal Progress,* v. 72, Dec. 1957, p. 82-85, 140.

High-speed tensile tests, on both smooth and notched specimens, show significant differences between the properties of galvanized sheet that are acceptable and those that are susceptible to breakage in fabrication on a Lockformer machine. The notched ultimate strength provides the best measure of performance, increasing strength being indicative of increasing susceptibility to breakage. (Q23q, Q27a, 3-67; ST, Zn, 4-53)

97-Q. **Strain Sensitivity of Some Mechanical Properties and Failure Characteristics of Zircaloy-2 Tubing.** L. F. Cochrun. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-FE-1005, Sept. 14, 1955, 9 p. (CMA)

Results evaluated for the bursting pressure, precent circumferential strain at bursting, area of crack opening and hole size of fracture. (Q27a, 3-68; Zr, 4-60)

98-Q. **Weight - Shape Conversion Tables for Zircaloy-2.** J. G. Goodwin. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-TM-86, May 10, 1956, 11 p. (CMA)

(Q general; Zr)

99-Q. **Tensile Properties and Metallographic Study of Zircaloy-3 Strip.** R. L. Mehan. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-RLM-12, June 13, 1957, 55 p. (CMA)

(Q27, M27; Zr)

100-Q. **Evaluation of the Engineering Properties of Titanium Carbide Base Cermets.** J. C. Redmond, et al. Wright Air Development Center, Tech-

nical Report 57-25. *U. S. Office of Technical Services,* PB 131026, July 1956, 67 p. (CMA)

TiC-base cermets were evaluated in impact tests, fatigue tests and by testing tensile stress-strain to rupture.
(Q general; Ti, C, *Ni, Cr, W,* 6-70)

101-Q.* Discussion of Some Models of the Rate-Determining Process in Creep. N. F. Mott. Paper from "Creep and Fracture of Metals at High Temperatures", p. 21-24.

Attempts to account for some of the facts of creep in terms of the movement of dislocations. Maintains that there are great difficulties in accepting the hypothesis of "climb" of dislocations, and that cell formation (polygonization) may occur through slip alone. In this case the rate-determining process must be slip and it is suggested that the barriers of greatest importance are jogs in screw dislocations. A stress-dependent activation energy for creep, which approaches that for self-diffusion at low stresses, results from this model. 14 ref. (Q3n, Q24a)

102-Q. Plastic Deformation of Aluminium Single Crystals at Elevated Temperatures. R. D. Johnson, A. P. Young and A. D. Schwope. Paper from "Creep and Fracture of Metals at High Temperatures", p. 25-46.

Creep tests were performed at elevated temperatures while maintaining a constant resolved shear stress to study the nature of the creep curve in crystals oriented for single slip on a (111) plane. Constant-load creep tests were employed to determine empirically the amount by which a high-temperature slip system, containing either a (100) plane or a plane tentatively identified as either a (311) or a (211) plane, had to be favored in order to operate. 43 ref. (Q3, Q24a, 2-62; Al, 14-61)

103-Q.* Mechanism of Grain Boundary Displacement and Its Relation to the Creep Process as a Whole. F. N. Rhines. Paper from "Creep and Fracture of Metals at High Temperatures", p. 47-57.

Study of the tensile creep behavior of pure Al bicrystals, having flat grain boundaries at 45° to their axes of loading. These specimens each had photo-engraved, upon one face, a reference pattern (of 133 squares to the in.) that facilitated the measurement of both the grain boundary displacement and the concurrent extension of the grains themselves. About 100 such bicrystals were tested within a temperature range of 200 to 650° C. and a stress range of 10 to 1600 psi., the duration of single tests attaining an exceptional maximum of one year. 8 ref. (Q3, N3; Al)

104-Q.* Creep Processes. W. A. Wood. Paper from "Creep and Fracture of Metals at High Temperatures," p. 59-71.

How crystalline structure responds to the corresponding kinds of deformation. Takes as basis of comparison the structural changes in the standard tensile test at room temperature and contrasts with these the changes peculiar to slow straining at elevated temperatures. The comparison shows that the latter introduces new structural features, described as stress-recovery, equilibrium flow and boundary flow. 24 ref. (Q3, M27)

105-Q.* Interaction Between Crystal Slip and Grain Boundary Sliding During Creep. D. McLean. Paper from "Creep and Fracture of Metals at High Temperatures", p. 73-78.

Rotation of subcrystals in Al during creep is shown to be proportional to elongation, from which it is deduced that practically all the crystal deformation occurs by a normal glide process. The amount of grain boundary sliding occurring in Al and Cu during creep is shown to be proportional to elongation, suggesting that a linear interaction exists between crystal slip and grain boundary sliding. 22 ref. (Q3, Q24a; Al)

106-Q.* Some Fundamental Experiments on High Temperature Creep. John E. Dorn. Paper from "Creep and Fracture of Metals at High Temperatures", p. 89-138.

At high temperatures creep strain appears to be a function of a temperature compensated time and stress. X-ray analyses and plastic properties reveal that the same structures are developed at the same values following creep at the same stress. 50 ref. (Q3, 2-62)

107-Q.* Creep and Aging Effects in Solid Solutions. A. H. Cottrell. Paper from "Creep and Fracture of Metals at High Temperatures", p. 141-155.

If recovery occurs during creep the creep resistance is reduced; if strain aging occurs it is increased. Aging in substitutional alloys is ac-

celerated during plastic flow. The minimum temperature for strain-age hardening during creep can be roughly estimated on the basis that vacancies are created during plastic flow and that these increase the rate of substitutional diffusion. 32 ref. (Q3, N7, N1)

108-Q.* Microstructure and Creep. J. W. Freeman and C. L. Corey. Paper from "Creep and Fracture of Metals at High Temperatures", p. 157-173.

Relationships between microstructure and creep reviewed from the viewpoint of extensive research on engineering alloys. Principles involved in solid solution, precipitation phenomena, cold work, multiphases, transformation structures, melting practice and grain size. 31 ref. (Q3, M27, N7)

109-Q.* Effect of Alloying on the Creep of Metals. L. Rotherham and C. R. Tottle. Paper from "Creep and Fracture of Metals at High Temperatures", p. 175-189.

Contributions to the understanding of creep have been made in two main directions, by analysis of experimentally determined creep curves, and by study of the factors affecting deformation. Using both methods, attempts have been made to predict the creep properties of alloys. The relationship between alloying and creep behavior appears capable of some degree of prediction. 66 ref. (Q3, 2-60)

110-Q.* Basic Principles of a Creep-Resisting Alloy. A. Constant and G. Delbart. Paper from "Creep and Fracture of Metals at High Temperatures", p. 191-214.

Essential part played in the resistance to creep by fine precipitates of additional phases, and the importance of heat treatment by which the nature, size and distribution of these precipitates can be controlled, with special reference to Cr-Mo-V steel. 27 ref.
(Q3, N7, 2-64; AY, *Cr, Mo, V*)

111-Q.* Creep of Solid Solutions and Compounds in Metallic Systems. I. I. Kornilov. Paper from "Creep and Fracture of Metals at High Temperatures", p. 215-219.

Alloys of continuous solid solutions, Mg-Cd, Cu-Ni, Fe-Ni; alloys of limited solutions of binary systems, Al-Mg, Ni-Cr, NiAl; alloys of ternary systems, Fe-Ni-Cr, Ni-Cr-Al, Ni-Cr-Ti, were investigated. 21 ref. (Q3, 14-67, 14-68)

112-Q.* Effect of Changing Loads During Creep. Y. N. Rabotnov. Paper from "Creep and Fracture of Metals at High Temperatures", p. 221-225.

Certain possibilities of the phenomenological description of one-dimensional creep in tension. Where the dependence between stress and strain is linear, a universal method which can be applied to a wide range of possible cases is that of Volterra's theory of hereditary elasticity. 4 ref. (Q3, Q25n)

113-Q.* An Approach to the Problem of Intercrystalline Fracture. R. Eborall. Paper from "Creep and Fracture of Metals at High Temperatures", p. 229-241.

Intercrystalline fracture behavior may be affected by viscous sliding of the boundaries and by other factors involved in the fracture process itself, as well as by the hardness of the crystals, which has an important effect in raising the local stresses. The fracture characteristics of an alloy may be greatly affected by small alloying additions, improved properties being obtained by adding high-melting point elements of "unfavorable" size factor. 46 ref. (Q26, 2-60)

114-Q.* Theory of Accelerated Creep and Rupture. C. Crussard and J. Friedel. Paper from "Creep and Fracture of Metals at High Temperatures", p. 243-262.

Experimental results on creep-rupture tests show the factors influencing the stability of the metal under test. Of the different causes of instability, some oppose rupture (boundary migration, recrystallization), others promote rupture (boundary-glide in certain cases, intergranular oxidation through a "micro-Kirkendall effect"). Rupture occurs through the slow formation of intergranular microcracks, which is itself caused by some intrinsic mechanism related to the recovery process occurring during creep. 50 ref. (Q3)

115-Q.* Theory of Brittle and Ductile Fracture With Application to Creep Fracture, Based on the Dynamic Behavior of Dislocations and Condensation of Vacancies. A. Kochendorfer. Paper from "Creep and

Fracture of Metals at High Temperatures", p. 263-280.

Suitable arrangements of dislocations lead to the break-up of the lattice if their energy is greater than the surface energy of the "holes" produced, a hole of this type being equivalent to a crack. A crack of atomic dimensions can be produced by a pile of single dislocations and grow to microscopic dimensions by means of further dislocations, the Griffith mechanism then leading to a brittle fracture. 62 ref. (Q26s, M26b)

116-Q.* Observations on Third Stage Creep and Fracture. C. H. M. Jenkins. Paper from "Creep and Fracture of Metals at High Temperatures", p. 287-298.

Tertiary creep and fracture have been studied in a number of materials by testing in a high vacuum to prevent oxidation over the range 15-950° C. The mode of deformation is greatly influenced by such changes as hardening by alloy additions, recrystallization, polygonization, spheroidization, age hardening, phase changes and even graphitization. The gradual onset of the effect of some of these factors as well as the development of cavities and cracks leads to tertiary creep. 7 ref. (Q3, Q26)

117-Q.* Tertiary Creep of Nimonic 80A. W. Betteridge. Paper from "Creep and Fracture of Metals at High Temperatures", p. 299-316.

Short-period low-stress torsional creep tests carried out at intervals during normal tensile creep experiments on Nimonic 80A have indicated that the number of available strain-promoting centers increases linearly with the tensile strain resulting from such centers and thus leads to the accelerating creep rate known as tertiary creep. This concept leads to a formula for the creep curve which agrees very accurately with the observed curves for this alloy. 4 ref. (Q3; SGA-h, Ni)

118-Q.* Grain Boundary Participation in Creep Deformation and Fracture. N. J. Grant. Paper from "Creep and Fracture of Metals at High Temperatures", p. 317-331.

Based on creep-rupture studies of a series of metals and alloys varying in composition from very high-purity aluminum to a complex age-hardenable gas turbine alloy, it is shown how alloying affects the behavior of grain boundary deformation and fracture. The ability of the grain boundary to recover is the major factor in determining the degree of embrittlement in high-temperature creep-rupture testing. 6 ref. (Q3, 2-60, Q26)

119-Q.* Investigations Into the Development of Intercrystalline Fractures in Various Steels Under Triaxial Stress. W. Siegfried. Paper from "Creep and Fracture of Metals at High Temperatures", p. 333-361.

Components used in mechanical engineering, even when made of heat resisting steels, often embody structural notches. As a result of the high temperatures at which heat resisting metals are utilized, modifications of the metal itself, such as aging, precipitation, recrystallization and alterations of phase, often occur with time. These processes greatly influence creep and must therefore be determined in some way when metals are tested. 15 ref. (Q3, 1-54, N general, Q25k)

120-Q.* Note on the Fracture Under Complex Stress Creep Conditions of a 0.5 Molybdenum Steel at 550° C. and a Commercially Pure Copper at 250° C. A. E. Johnson and N. E. Frost. Paper from "Creep and Fracture of Metals at High Temperatures", p. 363-382.

Little evidence is shown to support the Siegfried hypothesis that intercrystalline fracture is due to hydrostatic stress, and transcrystalline fracture to the maximum stress deviator. It is indicated by tests on both 0.5% Mo steel and Cu that the criterion of fracture may be the maximum principal (tensile) stress of the system imposed, irrespective of the actual physical nature of the fracture. (Q26r; AY, *Mo*, Cu-a)

121-Q.* Effect of a "V" Notch on the Tensile Creep Behaviour of a Molybdenum-Vanadium Steel. R. W. Ridley and H. J. Tapsell. Paper from "Creep and Fracture of Metals at High Temperatures", p. 383-401.

Tensile creep tests have been made on a Mo-V steel over the range 650-525° C. and at stresses of from 17 to 5 tons per sq. in. using test pieces in which a "V" notch had been machined circumferentially. The extent to which the presence of a "V" notch reduced the rupture life of the material at the notch by virtue of stress concentration ef-

fects is discussed and the effect of the notch on the amount of creep occurring. 9 ref.

170-Q. Analytical Methods for Determining Specific Damping Energy Considering Stress Distribution. E. R. Podnieks and B. J. Lazan. University of Minnesota. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131250, June 1957, 42 p. $1.25.

(Q8)

171-Q. Engineering Application of the Absolute Rate Theory to the Creep of Lead. M. B. Hogan. University of Utah. (Office of Naval Research.) *U. S. Office of Technical Services,* PB 121127, May 1955, 83 p. $2.25.

Data from three different published sources were analyzed through the absolute rate theory based on a four-element mechanical model. Metallurgical complexity of Pb and the influence of alloying elements and other factors on its mechanical properties were also examined.
(Q3, 2-60; Pb)

172-Q. Engineering Application of the Absolute Rate Theory to the Creep of Some Aluminum Alloys. M. B. Hogan. University of Utah. (Office of Naval Research.) *U. S. Office of Technical Services,* PB 131139, June 1956, 61 p. $1.75.

Creep data for seven cast and three wrought Al alloys analyzed in terms of a four-element mechanical model and the absolute rate theory. Values of the modulus of elasticity included. (Q3, Q21; Al)

173-Q. An Electronic Signaller to Reduce Quench-Cracking of Steel. L. D. Jaffee, D. C. Buffum and I. L. Preble. Watertown Arsenal Laboratory. *U. S. Office of Technical Services,* PB 131111, June 1952, 38 p. $1.

An instrument which responds with an electrical signal when a steel part being quenched has hardened sufficiently.
(Q29n, J26, 1-53; ST, 9-72)

174-Q. Description of Some Current Methods for Determining Creep Properties Under Compressive Bearing and Shear Type of Loading. E. L. Horne. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131259, June 1957, 32 p. $1.

(Q3, 1-54)

175-Q. Tensile Deformation of Aluminum as a Function of Temperature, Strain Rate and Grain Size. R. P. Carreker, Jr., and W. R. Hibbard, Jr. Wright Air Development Center. *U. S. Office of Technical Services,* PB 121143, July 1955, 27 p. $.75.

(Q27: 2-62, 2-59, 3-68; Al)

176-Q.* Improved Notch Toughness of Experimental Semikilled Steels Over One Inch in Thickness. R. W. Vanderbeck. *Welding Journal,* v. 37, Jan. 1958, 10s-20s.

Test results indicate that a semikilled steel containing about 0.16% C and 1.20% Mn may have sufficient notch toughness to be considered as an emergency substitute, or possibly as an alternate, for ABS Class C killed steel in thicknesses over 1 in. to 1¾ in. inclusive. 12 ref. (Q6n; ST-k)

177-Q.* Preheating — Residual Stresses—Stress Relieving. W. Spraragen. *Welding Journal,* v. 37, Jan. 1958, p. 21s.

Methods of stress relief; comparison of thermal stress-relief treatment with mechanical stress relief treatment. (Q25h, J1a, G23; 7-51)

178-Q.* Fatigue Strength of Silver-Alloy Brazed Joints in Steel. C. H. Chatfield and Sam Tour. *Welding Journal,* v. 37, Jan. 1958, p. 37s-40s.

Laboratory investigation leads to quantitative information regarding the fatigue strength of butt joints in steel brazed with B-Ag-1 Alloy. 4 ref. (Q7a; ST, 7-52)

179-Q. Thermal and Temper Brittleness of Ferritic (Pearlitic) Steels. P. B. Mikhailov-Mikheev. *Metallovedenie i Obrabotka Metallov,* no. 2, Feb. 1956, p. 23-33. (Henry Brutcher Translation no. 3977, Altadena, Calif.)

Previously abstracted from original. See item 421-Q, 1956.

180-Q. (Russian.) **Method of Steel Testing for Impact Fatigue.** N. F. Vyaznikov and S. S. Ermakov. *Zavodskaya Laboratoria,* v. 23, Sept. 1957, p. 1095-1097.

3 ref. (Q6, Q7, 1-54; ST)

181-Q.* (Spanish.) **Measurement of Internal Stresses in Electrolytic Deposits of Metals.** Francisco Munoz del Corral and Lamberto A. Rubio Felipe. *Instituto del Hierro y del Acero,* v. 10, July-Sept. 1957, p. 355-363.

Experiments designed to prove reproducibility of results in calculation of internal stresses on basis of simple mechanical method. Copper and iron strips were held straight in various types of baths during deposition of Cu, Ni, Cr. One end of strip was then released and allowed to curve freely until reaching equilibrium position. Formula based on radius of curvature, thickness of base metal and thickness of deposit gives internal stress values. 4 ref. (Q25; *Cu, Ni, Cr,* 8-62)

182-Q.* Improved Fabrication Techniques and Lower Cost Favor Titanium's Use. *Corrosion,* v. 14, Jan. 1958, p. 119-122.

Fabrication characteristics of titanium in connection with proposed use for chemical equipment. Principal physical properties of two grades of commercially pure Ti listed and compared with Type 304 stainless steel. Recommendations regarding procedure in welding Ti. 6 ref.
(Q general, K general, 17-57; Ti)

183-Q.* Effect of Heat-Treatment on the Creep and Creep-Rupture Behavior of a High-Purity Alpha Copper Aluminium Alloy at 300 and 500° C. J. P. Dennison. *Institute of Metals, Journal,* v. 85, Dec. 1957, p. 177-181.

Creep and creep-rupture tests have been carried out on a high-purity alpha Cu-Al alloy at 300 and 500° C. Effect of the treatment by which particular grain sizes were achieved, as well as that of actual grain size before testing. At 300° C., where

fine-grained specimens were the most resistance to rupture, and at 500° C., where those having coarse grain sizes gave superior creep-rupture lives, recrystallization at a high temperature during preparation of the specimen resulted in an inferior performance in both creep and creep-rupture tests. 20 ref.
(Q3m, M27c; Cu, Al)

184-Q.* **High Tensile Stainless.** *Iron and Steel,* v. 30, Oct. 1957, p. 487-488.

Data on tensile and other mechanical properties of FV520, a new high-tensile stainless at room and elevated temperatures following various heat treatments. Magnetic properties, electrical resistivity, thermal expansion and other physical properties. The weldable stainless steel is available as forgings, castings, sheet or wire and has composition of 0.07% C, 1.0% Si, 2.0% Mn, 14 to 18% Cr, 4 to 7% Ni, 1 to 3% Cu, 1 to 3% Mo and 0.5% Ti, with the remaining percentage iron.
(Q general, P general; SS, SGB-a)

185-Q. Steels at Elevated Temperatures. J. D. Murray. *Iron and Steel,* v. 30, Oct. 1957, p. 493-495.

Essential properties of high-temperature steels including oxidation resistance, fatigue properties, physical properties influencing thermal stress and creep resistance. Effect of deoxidation practice and mechanical working on creep behavior of steel. (To be concluded.) 9 ref.
(Q general, Q3, 2-62; ST, SGA-h)

186-Q. High-Boron Alloy Steels. T. H. Middleham, J. R. Rait and E. W. Colbeck. *Iron and Steel,* v. 30, Oct. 9, 1957, p. 526-534.

Reviews literature on Fe-B system and alloys. Effects of Fe addition on hot workability of B steels and melting, casting, forging, rolling, extruding and machining of B steels containing Al. Metallographic features of cast B steels with varying Al contents. Data on constitution and mechanical properties of B alloys as determined by microhardness, dilatation, X-ray diffraction and other studies. Welding properties and welding and brazing techniques. (Q general, M24; ST, *B, Al*)

187-Q.* Steels at Elevated Temperatures. J. D. Murray. *Iron and Steel,* v. 30, Nov. 1957, p. 597-601.

Summarizes literature and experimental data concerning influence of metallurgical variables on creep and rupture strength of steel. Solid solution strengthening and precipitation phenomena are considered controlling factors, with transformation products of secondary importance. Methods of obtaining creep data compared; procedure employing constant stress and temperature. 19 ref. (Q3m, 2-62; ST)

188-Q. Micro-Hardness Testing. R. Wall. *Iron and Steel,* v. 30, Nov. 1957, p. 611-612.

8 ref. (Q29q)

189-Q. Plated Finishes. The Choice Widens. Robert T. Gore and Robert M. MacIntosh. *Product Engineering,* v. 28, Oct. 28, 1957, p. 81-84.

Application, corrosion resistance, finish adhesion, hardness, abrasion resistance, ductility and reflectivity of electroplated deposits of single metals or alloys.
(Q general, P17a; 8-62)

190-Q.* (Italian.) **Influence of Heat Treatment on the Fatigue Resistance of Ergal Alloy.** F. Gatto. *Alluminio,* v. 26, Nov. 1957, p. 463-467.

Tests of Al alloy in different heat treat states showed that average fatigue resistance under rotary bending is not appreciably affected by hardening or aging conditions; that variations in resistance are linked to interaction between internal stresses produced during hardening and method of artificial aging. 10 ref. (Q7a, 2-64; Al)

Plastic properties of steels containing from 1 to 5.8% Si in temperature interval from −80 to 300° C. Determination of critical interval of brittleness in respect to Si content.

Application of low-temperature preheating (100-250° C.) increases ductility of transformer steel 20-fold. 4 ref. (Q23p; Q26s; ST, SGA-r)

194-Q. (Russian.) **Brittle Fracture of Red Copper.** S. K. Maksimov. *Fizika Metallov i Metallovedenie,* v. 4, no. 3, 1957, p. 483-489.

Brittleness of Cu at elevated temperatures under dynamic and static loads. 5 ref. (Q26s, 2-62; Cu)

195-Q. (Russian.) **Investigation of State of Strain in Surface Layers of Friction With Sign-Changing Slip.** K. V. Savitskii and Yu. P. Geraskevich. *Fizika Metallov i Metallovedenie,* v. 4, no. 3, 1957, p. 519-526.

Investigation of the character of surface layers and heat stability of Fe, Cu, Al and duraluminum subjected to unidirectional and reciprocal friction. 11 ref.
(Q9p, P11; Al, Cu, Fe)

196-Q. (Russian.) **Influence of Admissible Composition Variations of Soft Sheet Steel Upon Impact Resistance and Aging.** I. E. Brainin and N. V. Gubenko. *Metallovedenie i Obrabotka Metallov,* v. 1, Sept. 1957, p. 2-4.

Increase of carbon, phosphorus, manganese and sulphur contents decreases impact resistance but has no influence on aging. Increase of silicon contents has no influence on impact resistance but decreases rate of aging. 3 ref.
(Q6, N7a, 2-60, 4-53; ST, *C, Mn, P*)

197-Q. (Russian.) **Wear Resistance of Steel Surfaces Impregnated With Carbide-Forming Elements.** G. I. Dubinin. *Metallovedenie i Obrabotka Metallov,* v. 1, Sept. 1957, p. 21-25. (Henry Brutcher, Altadena, Calif., Translation no. 4015.)

3 ref. (Q9n; ST, 14-68)

198-Q. (Book.) **Creep and Fracture of Metals at High Temperatures.** 419 p. 1957. Philosophical Library Inc., 15 East 40th St., New York 16, N. Y. $12.00.

Proceedings of a symposium held at the National Physical Laboratory, Teddington, England, in May-June 1954. Papers abstracted separately.
(Q3, Q26, 2-62)

199-Q.* **Crystallographic Characteristics of Fracture in Magnesium Single Crystals.** R. E. Reed-Hill and W. D. Robertson. *Acta Metallurgica,* v. 5, Dec. 1957, p. 728-737.

Examination of the fracture mechanism in Mg has been made using single crystals strained in tension parallel to the basal plane. Fracture in a twin (parting) was observed as the primary mode of failure. In the temperature range 25-286° C., fractures occurred primarily in (3034) twins, while at −190° C. the habit plane of fracture was (1124). The low ductility of Mg strained in tension parallel to the basal plane is explained in terms of the fracture mechanism. 9 ref. (Q26, Q23p; Mg, 14-61)

200-Q. The Effect of Pickling and Anodizing on the Fatigue Properties of 2L40 and D.T.D. 683 Aluminium Alloys. J. M. Finney. *Australian Aeronautical Research Laboratories,* Report ARL/SM-255, July 1957, 33 p.

14 ref. (Q7, L12g, L19, 3-70; Al)

201-Q. Better Tests for Brittle Fracture. H. J. Nickols. *Canadian Metalworking,* v. 20, Dec. 1957, p. 34-36.

At present no test meets all requirements needed. Must first decide whether initiation or propagation of brittle fracture is more important in service failures.
(Q26s, 1-54, 2-60; ST)

202-Q.* **Properties of Some Silicon-Molybdenum Steels.** A. S. Kenneford. *Iron and Steel Institute, Journal,* v. 188, Jan. 1958, p. 16-22.

Heat treatment and mechanical properties. These steels, owing to their small volume changes on transformation, are resistant to thermal stress-cracking and also show great resistance to softening after tempering up to about 550° C. They also exhibit good ductility and impact value after tempering to give tensile strengths in the neighborhood of 120 tons per sq. in.
(Q general, 2-64; AY, *Si, Mo*)

203-Q.* **Elastic Properties of Yttrium and Eleven of the Rare Earth Elements.** J. F. Smith, C. E. Carlson and F. H. Spedding. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1212-1213. (CMA)

The elastic properties of all the lanthanons were studied except promethium, europium and thulium. Data for sonic velocity, density, elastic moduli (shear and Young's), Poisson's ratio and compressibility are tabulated. Lanthanum, samarium and ytterbium deviate from the linear trend in shear modulus, while Ce and Y deviate from the linear trend in compressibility. Oxygen impurity may explain the behavior of La. 5 ref. (Q21; EG-g)

204-Q.* Temperature Dependence of the Tensile Properties of Vanadium. J. W. Pugh. *Journal of Metals,* v. 9, *AIME Transactions,* vol. 209, Oct. 1957, p. 1243-1244. (CMA)

Arc-melted V ingots were hot rolled and then cold rolled to sheet, from which tensile specimens were cut in the rolling direction. Data on tensile and yield strengths, % elongation, strain-hardening and strain rate sensitivity were obtained at 300, 500, 700, 1000 and 1300° C. The temperature dependence of the tensile properties of V is typical of body-centered cubic metals, and is particularly sensitive at low temperatures. Many phenomena indicate strain-aging behavior. 10 ref. (Q27a, 2-61, N7e; V)

205-Q.* Tensile Deformation of Aluminum as a Function of Temperature, Strain Rate and Grain Size. R. P. Carreker, Jr., and W. R. Hubbard, Jr. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1157-1163.

Investigation of tensile properties of two lots of high-purity Al annealed at different temperatures to produce variations in grain size and tested at temperatures ranging from 20 to 880° K. Relationship of tensile properties to temperature, grain size and strain rate. 21 ref. (Q27, 2-61, 2-59, 3-68; Al)

206-Q.* Some Observations on 855° F. Embrittlement. G. F. Tisinai and C. H. Samans. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1221-1226.

Effects of various preheat treatment, cold rolling, decarburization and nitrogen level on hardening and embrittlement of 24 to 30% Cr steels held at temperatures near 885° F. for 24 hr. Hardness differences found and possible theoretical explanation. 15 ref. (Q26s, Q29n, 2-64; SS, *Cr*)

207-Q.* Sand Cast Magnesium. Rare Earth Metal-Zirconium Alloys. T. E. Leontis and D. H. Feisel. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1245-1252.

Sand castings of Mg alloys containing rare earths and various amounts of Zr following heat treatment were subjected to tensile tests at 70, 400 and 600° F., and 100-hr. creep limits were determined at 400 and 600° F. Effects of Zr, didymium, Ce, mischmetal and Th additions on grain size and mechanical properties. 17 ref. (Q27a, Q3m, 2-61; Mg, *Zr, EG-g*)

208-Q* Notch Tensile Properties of Selected Titanium Alloys. E. P. Klier and N. J. Feola. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1271-1277. (CMA)

Six alloys (Ti-5Al-2.5Sn, Ti-6Al, Ti-7Al-3Mo, Ti-4Al-4Mn, Ti-8Mn and Ti-15Cr) were prepared and contaminated with carbon, oxygen and nitrogen for tensile and notch-tensile testing from 75 down to —320° F. As single or combined contaminants increased, notch sensitivity was induced at a contaminant level which depended on the temperature and, in the notch-tensile tests, on the strength level. The critical strength level was in the 140,000-160,000-psi. range. Contamination limits for producing embrittled conditions were established. 7 ref. (Q27d; Ti)

209-Q.* Creep of Al-Cu Alloys During Age Hardening. Ervin E. Underwood. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1182-1189.

High-purity polycrystalline alloys of Al with 1 to 4% Cu were subjected to creep tests over a temperature range of 200 to 540° C. and hardness, X-ray and tensile tests performed. Creep tests made within both single and two-phase region of the equilibrium diagrams. Effect of aging on minimum creep rate determined. 24 ref. (Q3, N7a, 2-61; Al, *Cu*)

210-Q.* Grain Boundary Deformation in Fine-Grained Electrolytic Magnesium. S. L. Couling and C. S. Roberts. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1252-1256.

Specimens of completely recrystallized extruded electrolytic Mg were tested at 600° F. under stresses of 750, 500, 400 and 300 psi. with additional tests at 500 and 650° F. A grid technique was used in measuring grain boundary displacements. Measurement of grain boundary migration and number of boundary shears enabled calculation of strain localized at grain boundaries. Deformation found to be two-stage process involving alternate boundary shearing and migration. Explained by alternation of anelastic boundary shears with capture of these shears when boundaries migrate to new position. Repetition leads to cyclic process., 28 ref. (Q24m, M27f; Mg)

211-Q. Fatigue Properties of Gray Iron. Franz R. Brotzen and John F. Wallace. *Machine Design,* v. 29, Dec. 12, 1957, p. 154-158.

12 ref. (Q7a; CI-n)

212-Q.* **Zirconium-Tin Alloys.** R. F. Smart. *Metal Industry,* v. 91, Dec. 27, 1957, p. 535-539.

Zr-Sn system; creep resistance; tensile properties, effect of heat treatment on tensile properties; corrosion resistance of Zircaloy 1, 2 and 3; welding of Zr-Sn alloys. 11 ref. (Q general, R general; Zr, *Sn*)

213-Q.* **Measuring Hardness.** R. S. Marriner and F. C. P. Mason. *Metal Industry,* v. 91, Dec. 27, 1957, p. 539-540.

A new deadweight indenting machine, using a 136° pyramid indentor and standard loads of 30, 50, 100 and 120 kgf. has been designed and constructed and is accurate to ±5 D.P.N. units. (Q29, 1-53)

214-Q. **Radioactive-Tracer Technique for Studying Grinding Ball Wear.** M. Pobereskin, N. M. Ewbank, Jr., G. D. Calkins, A. Wesner and J. E. Campbell. *Mining Engineering,* v. 9, *AIME Transactions,* v. 209, Dec. 1957, p. 1356-1358.

6 ref. (Q9p, W15n, 1-59; ST)

215-Q.* **Fatigue Properties of Aluminium Alloys.** G. Forrest. *Sheet Metal Industries,* v. 34, Nov. 1957, p. 831-845.

Review of literature. Fatigue curves for a variety of Al alloys and the effects of heat treatment, work hardening, aging, notched specimen, mean stress, residual stress, surface finish, corrosion and metallurgical factors such as ingot size, grain size, test direction, heat treatment and mechanical working. 37 ref. (Q7a, 3-70; Al)

216-Q.* **Mechanical Testing of Thin Mild-Steel Sheet and Strip.** M. L. Hughes. *Sheet Metal Industries,* v. 35, Jan. 1958, p. 5-18, 22.

Production of cold reduced tinplate stock and its physical properties, together with hardness tests, micro-indentation tests, bend tests, tests for stiffness and "springiness", the "bend factor", variation in sheet springiness, springback, cupping tests, tensile tests and surface finish. (Q general, Q23q; CN, 4-53)

217-Q.* **Micro-Hardness Testing.** R. Wall. *Sheet Metal Industries,* v. 35, Jan. 1958, p. 61-62.

A review of practical experience and a suggested testing procedure. Errors in microhardness testing are generally caused by poor preparation of the test specimen, vibration of the testing machine, careless measurement of impressions and insufficient experience of the operator. (Q29q, 1-54)

218-Q.* **Deformation Studies in Metal Working Processes.** H. P. Tardif. *Steel Processing and Conversion,* v. 43, Nov. 1957, p. 626-632, 643-644, 650.

Comprehensive review of experimental and analytical method used to observe deformation of metals; results emphasize production of macro-inhomogeneities and/or micro-inhomogeneities during deformation. Methods which have been used in studying deformation of metals during extrusion, rolling, drawing or tensile loading include reference grids and markers, recrystallization phenomena, tensile strength, hardness, plasticine models, X-ray diffraction and metallographic studies. 127 ref. (Q24, 1-53)

219-Q. **High-Temperature Brittleness in Titanium Alloys.** N. Makrides and W. M. Baldwin, Jr. Case Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131381, June 1957, 29 p. $.75.

Studies of strain aging phenomena, high-temperature brittleness and stress-rupture behavior. (Q26s, Q3m, N7e; Ti)

220-Q. (French.) **Results of Experiments on the Forming of a Bessemer, BTM Steel Made With Oxygen-Enriched Air.** M. Thiault and J. Stremsdoerfer. *Institut de Recherches de la Siderurgie,* Series A, no. 170, Sept. 1957, 107 p.

Operations studied are rolling of sheet and plate for stamping and enameling, manufacture of wire and bolts, and welding. Bessemer steel is as good as openhearth steel for a great number of uses. However, openhearth steel is better for stamping. (Q23q, 17-57; ST-e, ST-g)

221-Q. (French.) **Steels for Pipe at Temperatures Above 600° C.** J. Ivernel. *Revue du Nickel,* v. 23, Sept. 1957, p. 61-71.

Research on the properties of austenitic steels at high temperatures; mechanical tests; experiments on corrosion. 12 ref. (Q general, R general, 2-62; ST, 4-60)

222-Q.* (German.) **Measurements of Internal Friction on Slightly Strained Iron-Carbon Alloys.** W. Wepner. *Acta Metallurgica,* v. 5, Dec. 1957, p. 703-710.

The time dependence of precipitation was investigated in a speci-

men of pure iron to which less than 0.02% C. was added, with or without previous slight deformation up to 5% strain. The undeformed specimen showed the well-known time law of the precipitation of carbide; the specimen strained 5% followed Cottrell's relation for the movement of carbon to dislocations. 12 ref. (Q22, N7, 3-68; Fe, *C*)

223-Q. (German.) **Application of Nodular Cast Iron in Machine Tool Fabrication.** Roland Fervers. *Industrie-Anzeiger,* v. 79, Sept. 24, 1957, p. 3-8.

Superior properties of nodular compared with gray cast iron. 9 ref. (Q general, W25, 17-57; CI-r)

224-Q. (German.) **Wear Behavior of Grinding Wheels.** G. Pahlitzsch and H. O. Erast. *Industrie-Anzeiger,* v. 79, Oct. 4, 1957, p. 1193-1199.

Wear depends upon the cutting speed and the grinding wheel hardness. 10 ref. (Q9, W25-s)

225-Q. (German.) **Notch Tensile Test and Its Application in Predicting Brittle Fracture. Pt. 3.** H. Flössner and K. Matthaes. *Schweizer-Archiv,* v. 23, Sept. 1957, p. 292-304.

65 ref. (Q27d, Q26s)

226-Q.* (Italian.) **Influence of Silicon Content and of the Presence of Manganese on the Properties of G-AS 13 UNI 3047 Alloys.** D. Gualandi. *Alluminio,* v. 26, Dec. 1957, p. 525-535.

Tests on sand and permanent mold castings with and without structural modification caused by salts showed that alloy containing 12% Si and 0.4% Mn had best over-all properties. 5 ref. (Q general, 2-60; Al, *Si, Mn,* 5-60, 5-63)

227-Q. (Japanese.) **Study of Aluminum-Magnesium Alloys Based on Super-Pure Aluminum. Pt. 3.** Yuzo Nakamura, Takuji Okugawa and Noboru Fukuchi. *Light Metals (Tokyo),* v. 7, Nov. 1957, p. 34-39.

Earing in deep drawing tests was investigated with alloy sheets containing 99.99% Al. 10 ref. (Q23q, G4b, 1-54; Al, *Mg*)

228-Q. (Japanese.) **Improvement of Heat Resistance of Aluminum Alloys by Addition of Zirconium. Pt. 3.** Yoshitsugu Mishima and Naoaki Takahashi. *Light Metals (Tokyo),* v. 7, Sept. 1957, p. 50-54.

Heating tests were carried out on casting alloys with softening behavior compared by measurements of Vickers hardness. (Q29n, 2-60; SGA-h, *Zr,* Al)

229-Q. (Japanese.) **Sintered Aluminum Products.** Masataka Sugiyama and Hisashi Suzuki. *Light Metals (Tokyo),* v. 7, Nov. 1957, p. 56-63.

Density, tensile strength, hardness and heat resisting properties of sintered compacts prepared from commercial flake powders and powders produced by atomization. 13 ref. (Q general, P general; Al, 6-72)

230-Q. (Japanese.) **Mechanical Properties of Binary and Ternary Zirconium Alloys.** Yoshitsugu Mishima and Shigeju Morikawa. *Light Metals (Tokyo),* v. 7, Sept. 1957, p. 64-69.

3 ref. (Q29n, Q27a, Q5k; SGA-h, Zr)

231-Q. (Russian.) **Summary of 40 Years of Work in Mechanical Testing in the U.S.S.R.** N. N. Davidenkov. *Zavodskaya Laboratoriya,* v. 17, no. 10, 1957, p. 1245-1265.

274 ref. (Q general, 1-54)

232-Q.* **Low-Temperature Deformation of Copper Single Crystals.** T. H. Blewitt, R. R. Coltman and J. K. Redman. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 179-207.

Single crystals of Cu were deformed at 4.2 and 77.3° K. At 4.2° K., after a large strain produced by normal slip, jerky flow, called discontinuous slip, occurs. From the study of reactor-irradiated crystals, it was deduced that a packet of 30 slip lines, each containing 10 dislocations, was released to form each jerk of the discontinuous flow. For samples of certain orientation the region of discontinuous flow was followed by a region of deformation twinning. The fact that deformation twinning was taking place was verified by X-ray methods. 6 ref. (Q24a, Q24b, 2-63; Cu, 14-61)

233-Q.* **Observations on Slip in Aluminum.** T. S. Noggle and James S. Koehler. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 208-214.

Experiments on 99.99% pure Al single crystals. The deformation was performed at helium temperature, at liquid-nitrogen temperature and at room temperature. At helium temperature the curve above 0.1 shear strain is approximately straight; at nitrogen temperature the curve begins to show stage III; at room temperature the entire region seems to be in stage III of work hardening. (Q24a, 2-63; Al-a, 14-61)

234-Q.* Effect of Pressure on the Plastic Deformation of Ni and Al. C. S. Barrett. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 238-240.

Increasing the pressure increases the flow stress. If pressure is decreased, flow stress decreases. There is a slight transient immediately upon reloading after the pressure is changed, but there is clearly a difference in flow stress. In all cases the crystal fractured by necking down; the type of fracture did not change under pressure. (Q24, Q26, 3-74; Al, Ni)

235-Q.* Yield Strength of Binary Alloys. Hideji Suzuki. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 361-390.

Yield strength depends on the interaction force between sources as well as on the force required to tear a dislocation from its locked site. The yield strength determined in experiment is usually the transition point at which the tangent in a stress-strain curve decreases considerably. The yield strength in theory therefore is reasonably determined from the theoretical stress-strain curve. 23 ref. (Q23b, M26b)

236-Q.* Deformation of Alloy Single Crystals. J. Garstone and R. W. K. Honeycombe. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 391-405.

With Al-3.5% Cu crystals, easy glide only occurs in the supersaturated solid solution when deformed at a low temperature, so that aging does not take place during the deformation. If the crystals are aged to peak hardness or overaged, before deformation, then the subsequent stress-strain curve shows normal parabolic hardening. 18 ref. (Q24, N7a; Al, *Cu*)

237-Q.* Yield Points in Al and Ni Single Crystals. C. S. Barrett. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 419-422.

Investigation of the yield points that appear upon reloading after prior plastic deformation and unloading. The yield point appears only if there has been previous plastic flows; the magnitude of the yield point effect increases with the flow stress at the time of unloading; the specimen must be subjected to a reduced load to show the effect. (Q23b, 3-68; Al, Ni, 14-61)

238-Q.* Behavior of Metals Under Reversed Stresses. N. F. Mott. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 458-478.

Current theory of work hardening of metals, especially with reference to their behavior under cyclic stress. A model is proposed which insures that the Frank-Read sources responsible for slip lines should not generate dislocations of the opposite sign with consequent work-softening when the stress is reversed. Model also gives explanation of the existence of fine and coarse slip. Friedel's model of work hardening is extended to explain the formation of multiple slip bands. A theory for the formation of a fatigue crack is proposed. 36 ref. (Q23a, Q24a, M26b)

239-Q.* Deformation and Fracture of Silicon. W. T. Read, Jr., and G. L. Pearson. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 537-544.

Purpose of the investigation was to study the stress-strain behavior of perfect crystals in the plastic range. The mechanism of plastic deformation in Si and the dominant effect of impurities even in the purest Si now available. The behavior is strikingly similar to that of iron containing carbon. There is a pronounced yield point at the beginning of plastic flow, the lower yield stress being less than half the upper yield stress. 8 ref. (Q24, Q26; Si)

240-Q.* (German.) **Fatigue Studies on Bonded Aluminum Structural Parts.** K. F. Hahn and H. D. Steffens. *Aluminium*, v. 33, Dec. 1957, p. 783-788.

Behavior of bonded extruded sections at high loads was studied on fatigue-testing machine (rotating bend) on specimens one meter long. Use of flexible interlayers gives higher fatigue limits than straight bonding or riveting. Prevention of sudden changes in resistance moment under flexures is needed when shaping parts to be bonded. 6 ref. (Q7; Al, 7-58)

241-Q. (German.) **Formation of Twin Crystals and Embrittlement of Steels.** Albert Kochendorfer and Herbert Scholl. *Archiv für das Eisenhüttenwesen*, v. 28, Aug. 1957, p. 483-488.

Microscopic and electron microscopic examinations of impact fractured

specimens show that three kinds of deformation twins exist—"A" twins, wide with irregular boundaries, "B" twins, narrow with smooth parallel boundaries, "C" twins, narrow, smooth and parallel boundaries but submicroscopic. Twin formation is only a secondary phenomenon and does not affect ductility of the material. 20 ref.
(Q24b, Q26s, M21; ST)

242-Q. (German.) **Properties of Steel C45 Under Deformation Processes and as Upsetting and Shearing in Relation to Temperature and Velocity of Deformation.** Werner Lueg and Hans-Günter Mueller. *Archiv für das Eisenhüttenwesen,* v. 28, Aug. 1957, p. 505-516.

In temperature range between 700 and 1100° C. the ductility and shear strength of a steel with 0.46% C. was tested and rate of deformation velocity and forces were recorded continuously. Ductility and shear strength correspond to the shape of the resulting curve. Even under elevated temperatures a work hardening process takes place, which can be suppressed or supported by varying deformation velocities. The ductility in relation to the velocity is expressed in an exponential function. For the relation between ductility and shear strength a simplified formula was developed. 12 ref.
(Q23p, Q2g, 2-62; ST)

243-Q. (German.) **Slip Textures on the Surface of Fatigue Tested High-Purity Aluminum.** Max Hempel and Angelica Schrader. *Archiv für das Eisenhüttenwesen,* v. 28, Sept. 1957, p. 547-556.

Multicrystalline high-purity Al was subjected to fatigue tests under various load conditions. Specimens were then investigated under light microscope and electron microscope. Fatigue strength is almost identical with yield strength of annealed Al. Specimens showed more hardening after increasing strain and length of test. Strong grain-boundary slip textures appear, increasing in frequency and variety with increasing length of time and increasing strain. The lower limit for the appearance of slip textures is determined. 20 ref. (Q7, M26c; Al-a)

244-Q. (German.) **Fatigue Testing.** W. Weibull and F. K. G. Odqvist. *Draht,* v. 8, Oct. 1957, p. 429-431.

A report on an international colloquium (International Union of Theoretical and Applied Mechanics) on fatigue testing held in Stockholm in May 1955. The proceedings and speeches were published in book form. (Q7)

245-Q. (German.) **Testing of Thin Sheet by Bending.** H. Cross. *Fertigungstechnik,* v. 7, Sept. 1957, p. 417-420.

294-Q.* Metallography of Low-Carbon Bainitic Steels. K. J. Irvine and F. B. Pickering. *Iron and Steel Institute, Journal,* v. 188, Feb. 1958, p. 101-112.

A relationship has been obtained between tensile strength or transformation temperature and the structural features. At high transformation temperatures (the lower tensile-strength level), the strength is largely controlled by grain size and, as the transformation temperature decreases, the grain size decreases and the tensile strength increases. At low transformation temperatures (the high tensile-strength level), although grain size is very fine, there is an increasing strengthening effect due to the dispersion hardening effect of the carbide particles. 13 ref. (Q27a, 2-59, N8m; CN-g)

295-Q. Recent Advances in Cermets. Robert Steinitz. *Jet Propulsion,* v. 28, Jan. 1958, p. 15, 68-70.

299-Q. Associated Flow Rule of Plasticity. D. R. Bland. *Journal of Mechanics and Physics of Solids,* v. 6, no. 1, 1957, p. 71-78.

The flow rule at singular points on a yield surface is found by considering the actual yield surface as the limit of a sequence of regular surfaces. Confirms the work-hardening and linearity hypothesis of Drucker. 10 ref. (Q23a, Q24)

300-Q. Elastic-Plastic Torsion of Sharply Notched Bars. J. A. H. Hult. *Journal of Mechanics and Physics of Solids,* v. 6, no. 1, 1957, p. 79-82.

The shape of the incipient plastic region at the tip of a sharp notch in a twisted bar is derived, assuming the material to be ideally plastic. The result is used to determine the strain in the plastic region. 5 ref. (Q1d)

301-Q.* New Alumina-Type Cermets. Thomas F. Frangos. *Materials in Design Engineering,* v. 47, Feb. 1958, p. 112-115.

Three types of cermets having alumina as the ceramic phase have been developed: chromium-alumina (LT-1); molybdenum-chromium-alumina (LT-1b); tungsten-chromium-alumina (LT-2). High-temperature strength, erosion and wear resistance, oxidation resistance, resistance to molten metals.
(Q-general, 1-62, R6m; 6-70)

302-Q.* Vacuum Cast Nickel Alloy Versus 'Best' Cobalt Alloy. J. J. Eisenhauer and John Preston. *Materials in Design Engineering,* v. 47, Feb. 1958, p. 116-117.

At 1200° F., the vacuum cast Ni-base alloy, Udimet 500, has three times the tensile strength of arc-cast AMS 5382, generally considered the best available Co-base high-temperature alloy. Under the same conditions of stress and service life, the operating temperature can be raised from 1525 to 1700° F. by substituting the Ni alloy, now commercially available, for the Co alloy.
(Q27a, 2-62, E-general, 1-73; SGA-h, Ni, Co)

303-Q.* Stronger Aluminum Casting Alloys. F. H. Smith. *Metallurgia,* v. 47, Feb. 1958, p. 64-70.

Demand for two types of strong Al casting alloy; in one, proof stress is regarded as more important than ductility and, in the other, the reverse. Alloys of Al with Cu, Mg, Zn and Mg, Si and Mg. It should be possible, by reducing the iron content of alloy LM 8 to about 0.15%, and by appropriate selection of Mg content and heat treatment, to produce stronger or, alternatively, tougher castings. 18 ref.
(Q27a, Q23p, 2-60, 2-64; Al, 5-60)

304-Q. Effect of Environments of Sodium Hydroxide, Air, and Argon on the Stress-Rupture Properties of Nickel at 1500° F. Howard T. McHenry and H. B. Probst. *National Advisory Committee for Aeronautics, Technical Note 3987,* Jan. 1958, 23 p.

13 ref. (Q3m, 2-62, 2-66; Ni)

305-Q. Strength of Welds in Carbon Steel. *Petroleum,* v. 21, Feb. 1958, p. 55-58.

51 ref. (Q27a, Q3m; CN, 7-51)

306-Q. (Hungarian.) **Impact Resistance of Steel Castings.** Zoltan Nagy. *Kohaszati Lapok,* v. 12, July 1957, p. 149-157.

(Q6; ST, 5-60)

307-Q. (Hungarian.) **Notes on Wear of Machine Tool Castings.** Miklos Cseh and Andor Gaal. *Kohaszati Lapok,* v. 12, July 1957, p. 163-171.

Service tests. 13 ref.
(Q9, W25, 17-57)

308-Q. (Swedish.) **Scatter in Strength of Light Alloy Castings.** F. Turner. *Gjuteriet,* v. 47, Dec. 1957, p. 204-206, 207-210.

Analysis of routine test results indicates different alloys should have different safety factors. 6 ref.
(Q-general, S12; T24; Mg, Al)

309-Q.* Effect of Different Surface Treatments on the Fatigue Strength of Drill Steel. T. W. Wlodek. *Canadian Mining and Metallurgical Bulletin,* v. 51, Feb. 1958, p. 89-101.

Effects of shot peening, induction surface hardening, spiral rolling, singly and in combination, on fatigue strength of SAE 1080 and Ni-Cr-Mo steels. Spiral rolling results in greatest improvement. Expected range and distribution of stresses during actual operations are estimated and mechanism of failure is analyzed. 26 ref. (Q7, 3-70, G23s; CN, AY, TS)

310-Q. How to Measure the Effects of Slack-Quenching. *Iron Age,* v. 181, Jan. 23, 1958, p. 80-82.

Impact test of steels shows uniformity of hardness and microstructure in any plane above immersion level and parallel to quenched end.
(Q6, J26n, ST)

311-Q.* Fracture of Metals. W. D. Biggs. *Iron and Steel,* v. 31, Feb. 1958, p. 57-60.

Review of the current theoretical explanations of crack initiation and propagation. Relationship between fracture stress, yield stress and grain size: influence of oxygen and yield delay on fracture stress. 42 ref.
(Q26)

312-Q.* Internal Friction. P. M. Robinson and R. Rawlings. *Iron and Steel,* v. 31, Feb. 1958, p. 65-68.

Using the linear relationships between the percent nitrogen and percent carbon in solid solution and the internal friction peak, the solubility of carbon and nitrogen in alpha iron at various temperatures is determined. The height of the internal friction peak is determined only by the quantity of solute in solid solution and is independent of the condition or size of the precipitate particles. Summary of work done using the internal friction measurement process. 60 ref. (Q22, N12p)

313-Q.* (French.) **Influence of Heat Treatment in Hydrogen Atmosphere on Properties of Binary Alloys of Magnesium and Zirconium.** Jean Herenguel, Jacques Boghen and Pierre Lelong. *Comptes Rendus,* v. 245, Dec. 16, 1957, p. 2272-2275.

Wrought alloy specimens containing from 0.20 to 0.57% Zr were treated in hydrogen atmosphere between 400 and 500° C.; reference specimens were treated in carbon dioxide and argon atmospheres; exposure times ranged up to 1000 hr. Mechanical properties were then measured at ordinary and high temperatures (200-500° C.) and endurance under given stress, contraction of cross section and distributed elongation after rupture were recorded. Structures were studied by micrography and tests made to determine respective percentages of soluble and insoluble zirconium.
(Q-general, J2k; Mg, *Zr*)

314-Q.* (French.) **New Research on Refractory Vanadium Steels.** A. Roos. *Metallurgie et la Construction Mécanique,* v. 90, Jan. 1958, p. 11-13.

Study undertaken to verify hypothesis that part of Mo content of refractory steels can be replaced by V, and to improve mechanical strength of these steels at high temperature. Vanadium tends to increase strength and to retard appearance of third (fastest) phase of creep. Equal refractoriness can be obtained by compositions containing less Mo and more V, provided proper normalizing heat treatment is given.
(Q27a, Q3, 2-62, 2-60; AY, *V,* SGB-q)

315-Q.* (German.) **Use, Manufacture and Heat Treatment of Cast Alloy Steel Rolls. Pt. 1. Stresses Heat Treating and Their Calculation.** Heinz Uhlitzsch and Gerhard Radomski. *Neue Hütte,* v. 2, Nov. 1957, p. 655-664.

Calculation of surface and core temperature and their temperature difference; compensating temperature and temperature difference across the section. 6 ref.
(Q25m, J-general. W23k; ST, 5-60)

316-Q. (Hungarian.) **Effect of Titanium on the Properties of Carburizing Steels.** Nandor Hajto. *Kohaszati Lapok,* v. 12, Jan-Feb. 1957, p. 3-14.

New types of Mg steel alloyed with Ti. 8 ref.
(Q-general, J28g; AY, *Mn, Ti*)

317-Q. (Italian.) **High-Temperature Alloys.** *Nickel,* no. 71, Dec. 1957, p. 1-12.

Properties to be considered in choice of heat resistant materials; metallic materials for high-temperature service and their properties. Covers cast iron, some wrought stainless steels, heat resisting casting alloys and superalloys.
(Q-general, 2-62; SGA-h, CI, SS)

318-Q.* **High-Temperature Strength of Alloys of Some Binary, Ternary, Quaternary, and Quinary Nickel Systems at 800°.** I. I. Kornilov and L. I. Pryakhina. *Academy of Sciences of the USSR, Proceedings, Chemistry Section,* v. 112, Jan-Feb. 1957, p. 5-7. (Translated by Consultants Bureau, Inc.)

Chromium, tungsten, titanium and aluminum were found to strengthen nickel by forming limited solid solutions of considerable concentration. Maximum strengthening is attained in regions of completely saturated and supersaturated solid solutions. 6 ref. (Q-general, N12p, 2-60, 2-62; Ni, *Al, Cr, Ti, W*)

319-Q.* **Fatigue Failures.** V. C. Young. *Eaton Engineering Forum,* v. 18, Dec. 1957, p. 2-8.

Basic causes of fatigue failure in internal combustion engine valves. Failures in neck or blend area are usually result of overstressing; lock groove areas fail because of high value seating velocities; head area failures are due to excessive operating temperature, excessive temperature gradients, overstressing from gas loading or mechanical high seating velocities combined with temperature. Methods for combatting each type of failure. (Q7, T7b)

320-Q. **Impact and Fatigue Properties of Ductile Cast Iron.** Charles F. Walton. *Machine Design,* v. 30, Jan. 1958, p. 128-131.

Influence of structure, composition, heat treatment on impact properties; fatigue strength, notch sensitivity, effects of surface finish on endurance limit. 6 ref.
(Q6n, Q7a; CI-r)

321-Q.* (German.) **Development of Macrohardness Recorder.** R. Böklen. *Werkstattstechnik und Maschinenbau,* v. 47, Nov. 1957, p. 627-630.

Experiments with a hardness recorder which marks force depth curve. Real hardness course can be most correctly determined with a penetrating body as sharp as possible. Force depth curve gives very precise permanent and objective results. (Q29, 1-53)

322-Q.* (Japanese.) **Properties of Cast Iron.** Kisao Abe. *Casting Institute of Japan, Journal,* v. 29, Dec. 1957, p. 846-853.

High-grade cast iron made with large amounts of steel scrap and with proper inoculation is superior to steel in compressive strength and acid resistance. It may be equal to steel in tensile strength, shock, fatigue and rust resistance. Tendencies toward increasing nitrogen and decreasing oxygen increase with higher percentage of steel scrap.
(Q-general; CI, RM-p)

323-Q. **Back Twist in the Manufacture of Wire Rope.** Joseph Regensburger, Jr. *Draht (English Edition),* no. 32, Dec. 1957, p. 11-15.

Change of properties of wire rope caused by variations of twist and back twist. Diagrams and mathematical formulas. (Q1, K13a, T7g)

324-Q.* **Softening of Cold Worked Metal by Alternating Strain.** W. A. Wood and R. L. Segall. *Institute of Metals, Journal,* v. 86, Jan. 1958, p. 225-228.

Measurements of the proof stresses required to impose successive reversals of plastic strain on specimens of cold worked Cu, Ni and Al subjected to alternating torsion tests. Further strain hardening occurs as the first reversals are applied but this hardening soon reaches a peak which is followed by softening. The latter is the more marked as the preliminary cold working is heavier and the plastic amplitude smaller. 9 ref. (Q23a, Q1; Cu, Ni, Al)

325-Q.* **Cracking of Mercury-Coated Alpha-Brass Under Alternating Strain.** W. A. Wood. *Institute of Metals, Journal,* v. 86, Jan. 1958, p. 228-231.

The phenomenon of mercury-cracking is utilized to determine how effective different amplitudes may be in building up local internal stresses, and so to test theories which attribute fatigue failure to

local development of high stresses. The effectiveness of the alternating strain decreases sharply below a particular range of amplitudes, and as a result of this and related effects it is suggested that two mechanisms of fracture exist, one for large amplitudes and one for small. (Q7, Q26)

326-Q.* Extrapolation of the Stress-Rupture Properties of the Nimonic Alloys. W. Betteridge. *Institute of Metals, Journal,* v. 86, Jan. 1958, p. 232-237.

Four methods proposed for the extrapolation of the stress-rupture properties of high-temperature alloys are compared with regard to their application to the Ni-base alloys Nimonic 80A and Nimonic 90. The best results were obtained by using a time-temperature parameter. 7 ref. (Q3q; Ni, SGA-h)

327-Q.* Wear of Metals. F. T. Barwell. *Institute of Metals, Journal,* v. 86, Feb. 1958, p. 257-269.

Mechanism of wear. Wear conditions, such as rolling contact, scuffing, fretting corrosion and the effect of oxygen on friction and surface damage during simple sliding. (Q9n)

328-Q.* Interaction Between Slip Bands and Particles of Precipitate in an Aluminium Alloy. Shigeyasu Kodo and Taro Takeyama. *Institute of Metals, Journal,* v. 86, Feb. 1958, p. 277-280.

Alloy was aged at 250° C. to a point just beyond the hardness maximum. After heat treatment the alloy was stretched by 1-2%. Slip bands were short and of the lamellar type, and platelets in their path were bent. Similar bending was observed on specimens taken from the interior of the alloy, suggesting that slip phenomena in the interior are similar to those on the surface. (Q24c, N7a; Al)

329-Q.* Further Observations on the Ductility of Chromium. H. L. Wain, F. Henderson, S. T. M. Johnstone and N. Louat. *Institute of Metals, Journal,* v. 86, Feb. 1958, p. 281-288.

Nitrogen, present as an impurity, can raise the ductile-brittle transition of cold rolled Cr by at least 300° C., but oxygen in the range 0.01-0.06% produces no marked or consistent effect. Evidence for Cottrell locking in Cr is advanced, particularly in respect of the temperature-dependence of yield stress and brittle fracture stress. (Q23p, Q23r, 3-69; Cr)

330-Q.* Relationship Between Scleroscope, Rockwell, and Brinell Hardness Readings. N. R. Arant and J. J. Marsalka. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 160-161.

Controlled series of hardness tests were conducted on chill iron, grain iron and carbon steel, resulting in a table for converting from C-2 Scleroscope to Rockwell hardness values and vice versa. (Q29e)

331-Q. Russian Research on Lubrication and Wear. Douglas Godfrey. *Lubrication Engineering,* v. 14, Jan. 1958, p. 27-31.

Kinetics of lubricant additive; action and use of radioactive isotopes of sulphur and phosphorus to measure amount of film formed. 11 ref. (Q9, 1-59, 18-73, NM-h)

332-Q.* Surface Fatigue of Carbonitrided Steel. G. W. Powell, M. B. Bever and C. F. Floe. *Metal Progress,* v. 73, Mar. 1958, p. 67-69.

The pitting of worn carbo-nitrided surfaces is shown to be related to case depth and amount of retained austenite. Performance of carburized surfaces, run in conjunction, indicates case depth to be the prime factor. (Q7, Q9, J28m; ST)

333-Q.* Improvement in High-Temperature Alloys by Boron and Zirconium. W. J. Pennington. *Metal Progress,* v. 73, Mar. 1958, p. 82-86.

While most tramp elements have been regarded as detrimental to high-temperature alloys, it is found that additions of 0.01% B and 0.10% Zr (or both), usefully reduce the tendency to notch brittleness at service temperatures and improve rupture strength. (Q3m, Q26s, 2-60; SGA-h, Fe, Ni, Co, *Zr, B*)

334-Q. What's Happened to Cermets. J. W. Graham and W. F. Zimmerman. *Metal Progress,* v. 73, Mar. 1958, p. 89-91.

Originally intended for jet engine parts, cermets have become useful in other fields. Their resistance to corrosive liquid metals and acids makes them valuable for pump seals in rockets and nuclear plants. (Q-general, T2p, T11, 17-57; 6-70)

335-Q. Effect of Temperature on Rolling-Contact Fatigue Life With Liquid and Dry Powder Lubricants. Thomas L. Carter. *National Advisory Committee for Aeronautics, Technical Note 4163,* Jan. 1958, 40 p.

Life of AISI M-1 toolsteel decreases with increasing temperature. 10 ref. (Q7b, 2-61; TS, NM-h)

336-Q. Ultrasonic Absorption in Metals. A. I. Akhiezer, M. I. Kaganov and G. Ia. Liubavskii. *Soviet Physics-JEPT*, v. 5, Nov. 1957, p. 685-688. (Translation by American Institute of Physics.)

4 ref. (Q21f)

337-Q.* The Minimum Bend Radii of Aluminum Alloy Tubes. D. A. Barlow. *Welding and Metal Fabrication*, v. 26, Mar. 1958, p. 90-95, 110.

Tests on tubing of various hardnesses and ratios of outside diameter to wall thickness. (Q5g; Al, 4-60)

338-Q. (French.) **New Anti-Wear Coating.** Felix Barbas. *Machine Moderne*, v. 52, Jan. 1958, p. 21-25.

Tests of Pb-Mo sulphide coatings. (Q9p; Mo, Pb; NM-h)

339-Q. (French.) **Possibilities of Modern Castings.** Jean Gonin and Gerard de Smet. *Machine Moderne*, v. 52, Jan. 1958, p. 57-65.

State of development of special castings; Ni-Resist, Ni-Hard, austenitic Ni-Cr-Mo, pearlitic, phosphoritic and others. (Concluded.) (Q-general, E-general; Ni, SS, SGA-h, 5)

340-Q. (French.) **Kinematic Aspects of Fracture.** J. Leeuwerik. *Métaux Corrosion Industries*, v. 32, Nov. 1957, p. 443-457.

Study of fracture causes and propagation by means of geometric fracture figures; new ultrasonic methods; treatment of different materials; increasing fracture resistance. 20 ref. (Q26)

341-Q.* (German.) **Tensile Strength of Aluminum Sand Castings Cast From Remelted Alloys.** Hans Reininger. *Giesserei-Praxis*, no. 4, Feb. 25, 1958, p. 57-69.

Composition of seven alloys and technique of test casting. Measurements on untreated and treated (chlorinated) specimens. Relationship between tensile strength, breaking tension and chlorine treatment. (Q27a, 2-60; Al, 5-60)

342-Q.* (German.) **Classification of Steel Structures From the Point of View of Their Resistance to Brittle Fracture.** K. Rühl. *Schweissen und Schneiden*, v. 10, Feb. 1958, p. 39-44.

New German standard (DIN 17.000) and advice of German Committee for Steel Construction for classification of steel quality; transition temperature as a criterion for safety against brittle fracture; deformation values (stretching, necking, bending angle) cannot be used as criteria because it is impossible to reduce the variables to one simple value. (Q26s, Q23r; ST, SGA-s)

343-Q. (German.) **Problem of Brittle Fracture of Steel.** W. Felix and T. Geiger. *Schweisstechnik*, v. 11, Dec. 1957, p. 158-162.

Examination of deformation state of crystals by X-ray (back-reflection method). Correlation between crystal orientation, microhardness and deformation behavior. (Q26s; ST)

344-Q. (German.) **Properties of Metal Melts. Pt. 14. Internal Friction of Lead-Tin and Lead-Antimony Alloys.** E. Gebhardt and K. Kostlin. *Zeitschrift für Metallkunde*, v. 48, Dec. 1957, p. 636-641.

(Q22, P10f; Pb, *Sn*, *Sb*)

Experimental technique with a new interference optical apparatus. Evaluation of results. Creep behavior at various temperatures. Quantitative correlation to stress-strain curve. 22 ref. (Q3; Al, Cu, Ni)

346-Q. (German.) **Deformation Anisotropy of Ordered Solid Solutions.** Hans-Joachim Bunge. *Zeitschrift für Metallkunde*, v. 49, Jan. 1958, p. 40-42.

8 ref. (Q24g; 14-67)

347-Q.* (German.) **Resistance to Upsetting by Zinc and Zinc Alloys.** Erich Pelzel. *Zeitschrift für Metallkunde*, v. 49, Jan. 1958, p. 47-52.

Resistance to upsetting in relation to orientation of crystallites. Influence of soluble and insoluble additions. 12 ref. (Q24, F22j; Zn)

348-Q.* (Italian.) **Properties of Bronze Test Bars.** Ernesto Bosio. *Fonderia Italiana*, v. 7, Jan. 1958, p. 9-12.

Tests to determine influence of feeding system, pouring temperature and degassing of molten metal on ultimate strength and per cent elongation. (Q27a, E23; Cu-s)

349-Q.* (Italian.) **Some Aspects of the Hot Working of Magnesium and Magnesium-Base Alloys.** G. Tosatto. *Metallurgia Italiana*, v. 49, Dec. 1957, p. 817-824.

Experimental hot rolling, extrusion and forging and subsequent testing

revealed influence of prior annealing, working temperature and speed, percentage of reduction and other factors on mechanical characteristics of products obtained. 4 ref. (Q-general, F22, F23, F24, 1-66; Mg)

350-Q.* (Portuguese.) **Brittle Fracture in Automotive Suspension Springs.** Alberto A. Arantes, Michael L. Pinkuss and Francisco P. do Canto. *ABM, Boletim da Associacao Brasileira de Metais,* v. 13, Oct. 1957, p. 319-327.

Study of springs made of Brazilian steels and steels from other countries leads to conclusion that principal cause of brittle fracture of springs in vehicles in service in Brazil is condition of roads in that country. Use of more resilient, tougher steels is recommended. 10 ref. (Q26; ST, SGA-b)

351-Q.* (Russian.) **Nature of Critical Degree of Deformation.** Y. R. Rauzin and A. R. Zheleznyakova. *Metallovedenie i Obrabotka Metallov,* Dec. 1957, p. 41-48.

Recrystallization of metals after minor deformation is little studied. Rapid grain growth during heat treatment is associated with initial state of deformation. This state is characterized by intergrain transfer in polycrystalline metals such as Al. Critical interval appears during slow deformation. Active forces wedge and dislodge grains which become distorted. New grains are formed during subsequent heating. 7 ref. (Q24, N5)

352-Q. (Russian.) **Effect of Deep Anodizing on the Fatigue Resistance of Aluminum Alloys AK-4 and VD-17.** A. S. Nikishov, G. V. Kurganov and N. I. Yarzhemskaya. *Metallovednie i Obrabotka Metallov,* Dec. 1957, p. 66-68.

(Q7a, L19; Al)

353-Q.* **Wear Resistance: Is Melting Point the Key?** H. A. Unckel. *Iron Age,* v. 181, Mar. 20, 1958, p. 97-100.

Abrasion tests on Al, Cu and Fe samples by sandblasting, carborundum belts and carborundum powder indicate a correlation between abrassion resistance and melting point. 6 ref. (Q9n, P12n)

354-Q.* **Effect of Phosphorus on Tensile and Notch-Impact Properties of High-Purity Iron and Iron-Carbon Alloys.** B. E. Hopkins and H. E. Tipler. *Iron and Steel Institute, Journal,* v. 188, Mar. 1958, p. 218-237.

Investigation on various Fe-P and Fe-P-C alloys. Presence of phosphorus increases strength of alloys and produces progressive development of grain-boundary weakness. In the Fe-P-C alloys carbon eliminates grain-boundary weakness in case of slow cooling after heat treatment. (Q27a, Q6n, 2-60; Fe, *P*)

355-Q.* **A New Standard Hardness Testing Machine.** R. S. Marriner and F. C. P. Mason. *Metallurgia,* v. 57, Jan. 1958, p. 47-51.

A new diamond pyramid hardness testing machine using freely suspended dead weights and a micrometer microscope. (Q29c, 1-53)

356-Q.* **Strain Hardening Behavior of High Purity Copper. An Appraisal of Tests by Carreker and Hibbard.** E. Voce. *Metallurgia,* v. 57, Mar. 1958, p. 111-116.

Effects of temperature from −253 to 950° C. and grain size on various tensile properties of high-purity copper. (Q27a, 2-61, 2-59; Cu-a)

357-Q. Materials for Aircraft Structures Subjected to Kinetic Heating. A. J. Murphy. *Royal Aeronautical Society, Journal,* v. 61, Oct. 1957, p. 653-666.

Steels and Al, Mg, Ti and Ni alloys are compared in the following respects: structural efficiency at ordinary temperatures; thermal stresses; structural efficiency at high temperature. 9 ref. (Q-general, 2-62, T24; ST, Al, Mg, Ni, Ti)

(Q26s, T11g, 2-67; 8-66, Zr-b, U-b)

360-Q.* (English.) **Fatigue Fracture Criterion in Metals Based on Dislocation Theory.** Takeo Yakobori. *Tohoku University, Technology Reports,* v. 22, no. 1, 1957, p. 51-61.

With static stress it is assumed that under alternating stresses some of the dislocations are also in cyclic motion and are piled up cyclically against obstacles such as inclusions during forward and backward mo-

tion; a ductile fracture occurs and strength does not decrease appreciably. Fatigue theory is tentatively explained: the binding force on the interface between the obstacle and matrix gradually decreases or submicroscopic cracks appear on the interface during cyclic stress. 21 ref. (Q7, M26b)

361-Q.* (French.) **New Machine for Creep Tests Under High Vacuum and Low Load.** A. Gautier. *Revue de Metallurgie,* v. 55, Jan. 1958, p. 9-16.

Components and operation of machine built at French Atomic Energy Commission's research center at Saclay. (Q3, 1-53)

362-Q.* (French.) **On the Nature of Contact Corrosion Products Formed During Tension-Compression Tests on Riveted Joints in Type AG. 5 Light Alloy.** A-R. Weill. *Revue de Metallurgie,* v. 55, Jan. 1958, p. 61-66.

Abundant formation of powdery corrosion products was observed on faying surfaces of joints, whether insulated or not, during tension-compression tests. X-ray diffraction analysis revealed presence of various mono and tri-hydrated forms of alumina, although anhydrous alumina was not found. Possible damage of faying surfaces by these oxides during course of tests discussed in terms of the comparative hardnesses of these corrosion products and of the alloy studied. 8 ref. (Q28, R2; Al, 7-53)

363-Q.* (German.) **Influence of Small Quantities of Impurities on the Hot Hardness of Tungsten.** T. Millner and L. Sass. *Acta Technica Academiae Scientiarum Hungariae,* v. 19, Aug. 1957, p. 115-125.

Investigation of hot hardness by specially constructed semi-micro hardness measuring apparatus. Traces of Si in W increase its hardness at 800° C. from 180 to 250. (Q29p, 1-53; W)

364-Q.* (German.) **New Theory of Rolling.** A. Geleji. *Acta Technica Academiae Scientiarum Hungariae,* v. 19, Aug. 1957, p. 199-241.

Outline of previous theories. New theory holds that resistance to forming is equal to sum of the yield stress and the compressive stress which consists of two components. All three compressive stresses are at their maximum in neutral cross section. (Q23q, F23, 17-52)

365-Q. (German.) **Permissible Loadings of Aluminum Compression Members.** J. Weinhold. *Aluminium,* v. 34, Mar. 1958, p. 143-151.

367-Q. (German.) **Bend Testing of OFHC Copper Wire.** H. Klatte. *Metall,* v. 12, Feb. 1958, p. 125-126.

Method of testing special high-purity Cu by annealing in hydrogen stream and wrapping around a shaft. (Q6; Cu-a)

368-Q. (German.) **Brittleness of Bright Nickel Plating.** K. H. Hartung. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Feb. 1958, p. 42-44.

9 ref. (Q26s, 8-62; Ni)

369-Q.* (German.) **Determination of Notch Toughness, Fracture Appearance and Bending Angle as Dependent on Testing Temperature.** Alexander Schepers and Franz-Rudolf Licht. *Stahl und Eisen,* v. 78, Feb. 20, 1958, p. 227-235.

Determinations were made on DVM test bars taken from round bars of killed openhearth steel, and from mining channels of basic converter rimming-type steel. Assessment of brittle fracture behavior from relative bending angle and relative magnitude of percentage crystallinity in the fracture. Notch toughness value for the transition from mixed to brittle fracture. 14 ref. (Q26, Q23s, 1-54)

370-Q. (Japanese.) **Controlling Directionality of Aluminum Sheet. Pt. 4.** Takuichi Morinaga, Shigeo Zaima, Tsuneo Takahashi and Kunio Shimizu. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 43-47.

5 ref. (Q24; Al, 4-53)

371-Q. (Japanese.) **Controlling Directionality of Aluminum Sheet. Pt. 5.** Takuichi Morinaga and Shigeo Zaima. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 48-50.

Directionality is detected by the damping capacity in cantilever-type transverse oscillation. (Q24, Q8g, Al, 4-53)

372-Q.* (Japanese.) **Effect of Chromium, Iron, Silicon, Manganese or Zirconium on Properties of 52S Alloy Sheets.** Takashi Ikeno and Kizo Shibata. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 51-54.

Specimens containing less than 0.2% and more than 0.3% Cr were inferior in stress-corrosion resistance. Resistance increased with increasing Fe or Si content. Tensile strength and hardness are higher for specimens containing 0.6% Fe, but lower for those with 0.6% Si. Small amounts of Mn or Zr increase tensile strength and hardness. Casting structure becomes very fine with addition of 0.5% Zr. (Q-general, R-general, 2-60; Al)

373-Q. (Japanese.) **Effect of Manganese and Chromium on the Performance of Aluminum-Magnesium 2-5% Wrought Alloys. Pt. 1. Mechanical Properties of Sheet.** Rihei Kawauchi. *Light Metals (Tokyo)*, v. 8, Jan. 1958, p. 55-77.

16 ref. (Q27a, Q23a, R-general, 2-60; Al, Mg, *Cr, Mn*)

374-Q.* (Japanese.) **Difference Between the Effect of Static and Impact Compression on the Internal Friction of Commercially Pure Aluminum.** Genjiro Mima, Riyozo Inoue and Mitsugu Tokizawa. *Light Metals (Tokyo)*, v. 8, Jan. 1958, p. 88-92.

Internal friction decreased to a constant value upon standing at room temperature. Friction introduced by impact compression was greater than that by static compression, with an accelerated decrease of the former on standing. In a 15% reduced specimen, standing at room temperature for 100 min., friction caused by impact compression was several times greater than that caused by static compression. 17 ref. (Q22; Al-a)

375-Q.* **Mechanism of Creep.** *Metal Industry*, v. 92, Jan. 31, 1958, p. 88, 96.

Studies of theoretically possible creep mechanisms demonstrated that no one theory fully covers the data available, but two theories have not yet been shown to be erroneous. One suggests that concentration gradients of vacant lattice sites are set up in a creep specimen under the influence of the applied stress. Vacancies move in accordance with the gradients, setting up a net flow of vacancy causing elongation in the direction of the applied stress. The second theory suggests that the generation and movement of dislocations give rise to an observed strain. (Q3)

376-Q.* **On Kinetic Friction Between Unlubricated Metallic Surfaces.** F. F. Ling and Edward Saibel. *Wear*, v. 1, Dec. 1957, p. 167-172.

Proposes a theory of friction between unlubricated metallic surfaces in sliding contact. Coefficient of friction is found as the ratio of the shear strength to the yield pressure multiplied by a factor in which additional effects of load, relative velocity, temperature and other physical properties appear. Postulates that process of welding and fracturing of surface asperities is a unimolecular reaction. 7 ref. (Q9p)

377-Q.* **Use of Radioactive Specimens on a Kinetic Boundary Friction Machine.** R. B. Campbell and G. Harriden. *Wear*, v. 1, Dec. 1957, p. 173-182.

Modification to a kinetic boundary friction machine necessitated by the use of radioactive Cu as the smaller rubbing contact. Photographic method to detect Cu which has been transferred; quantitative assessment of autoradiography and graphical method of handling experimental results. 7 ref. (Q9p, 1-58; Cu)

378-Q. **Diagnosis and Analysis of Plain Bearing Failures.** P. P. Love. *Wear*, v. 1, Dec. 1957, p. 196-210.

379-Q.* **Alleviating Abrasive Wear in Ceramic Industry Handling Equipment.** C. M. Allen. *Wear*, v. 1, Dec. 1957, p. 232-238.

Application of wear resistant materials in plant equipment forming and fabricating ceramics. 9 ref. (Q9, T29a, 17-57; SGA-m)

380-Q. **Practical Measures to Prevent Abnormal Wear in a Steel Mill.** J. De Vries. *Wear*, v. 1, Dec. 1957, p. 239-243.

(Q9, W10a, ST)

381-Q.* **Review of Boundary Lubrication.** C. B. Davies. *Wear*, v. 1, Dec. 1957, p. 244-253.

Solid boundary lubricants, significance of physical adsorption and molecular orientation, suspensions of metal soaps and lubrication under extreme pressure. 26 ref. (Q9; NM-h)

382-Q. **Castable Ductile Metal for Strong, Complex Parts.** *Western Metalworking*, v. 16, Feb. 1958, p. 23-26.

Properties and uses of Vulcan Spherulite, a ductile iron. (Q-general; CI-r, 17-57)

383-Q.* Engineering Properties of Metals at High Temperatures. N. P. Allen. Paper from "Behaviour of Metals at Elevated Temperatures", Institution of Metallurgists, London, 1957, p. 3-30.

Effects of high temperatures on stability of dimensions and mechanical properties, elastic constant and coefficient of expansion, resistance to plastic deformation and fracture, behavior under fluctuation of temperature, resistance to chemical attacks. Principles involved in developing alloys having good mechanical properties at high temperatures. (Q-general, 2-62; SGA-h)

384-Q.* Effect on Metals of Temperatures up to 450° C. G. Meikle. Paper from "Behaviour of Metals at Elevated Temperatures", Institution of Metallurgists, London, 1957, p. 33-61.

Effects on tensile strength, creep properties, fatigue strength and corrosion resistance of Al, Mg and Ti alloys, sintered Al powder parts, Al-Ni-Fe bronze and stainless steels. Particular reference to structural materials for aircraft and missiles. 12 ref. (Q-general, R-general, 2-62, T24a, 17-57; Al, Mg, Ti, SS, SGA-h)

385-Q.* Non-Ferrous High-Temperature Materials. L. B. Pfeil. Paper from "Behaviour of Metals at Elevated Temperatures", Institution of Metallurgists, London, 1957, p. 67-90.

Types of Co, Ni, Pt, Mo, Cr and Ti-base alloys suitable for temperatures above 500° C. Corrosion resistance, high-temperature tensile strength, creep strength, fatigue strength, other properties. 11 ref. (Q-general, R-general, 2-62; Co, Ni, Pt, Mo, Cr, Ti, SGA-h)

386-Q.* High-Temperature Steels. W. B. Bardgett. Paper from "Behaviour of Metals at Elevated Temperatures", Institution of Metallurgists, London, 1957, p. 93-122.

Reviews corrosion resistance, creep strength, high-temperature tensile strength, ductility of carbon steels, low-alloy steels, intermediate steels, 12% Cr steels and austenitic steels. Relation of properties to composition. 23 ref. (Q-general, R-general, 2-62; CN, AY, SS, SGA-h)

387-Q. Changes of Mechanical Properties of Nickel-Chromium Alloys Used in Stationary and Propulsion Turbines Upon Isothermal Prolonged Heating (up to 10,000 Hr.). V. Z. Tseitlin and G. G. Morozova. *Metallovedenie i Obrabotka Metallov,* Jan. 1958, p. 30-35. (Henry Brutcher, Altadena, Calif., Translation no. 4121.)

Ni-Cr steel containing Mo and W and also Al and Ti in 1:2 ratio is very stable at 700 and 750° C. Relaxation curves indicate excellent heat resistance. Physico-chemical processes are extremely slow; alpha phase remains in the alloys even after 10,000 hr. at 750° C. Certain changes took place after 1000-3000 hr., probably due to decomposition of double carbides without. however, any practical effect upon the process of relaxation. 5 ref. (Q3; SGA-h, Ni, Cr)

388-Q.* (English.) **Fatigue Fractures and How to Avoid Them.** *Aciers Fins & Speciaux Francais,* no. 27, Dec. 1957, p. 48-57.

Nature of, factors involved in, and influence of various designs and conditions on fatigue fracture. Examples illustrate shapes and surfaces prone to fatigue fracture. Suggestions for improving endurance. 5 ref. (Q7a, 17-51)

389-Q.* (English.) **Some Experiments on the Embrittlement of Malleable Iron. Pt. 2.** Nobuhisa Tsutsumi. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 17-26.

Malleable iron specimens with phosphorus varying from 0.1-0.36% were held at different temperature for times up to 100 hr. to study the ductile-to-brittle transition. Results of Charpy impact tests, corrosion tests, electron diffraction examination, metallographic examination, microhardness tests, electropotential measurements of iron in ductile and in brittle states. (Q26s, 1-54; CI-s)

390-Q. (English.) **Measuring the Coefficient of Friction in Cold Strip Rolling.** Hiroshi Yamanouchi and Yuji Matsuura. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 57-62.

(Q9p, F23; 4-53)

391-Q. (Czech.) **Tests Made With Relaxation Test Block Assemblies.** Radovan Pech. *Hutnické Listy,* v. 12, no. 12, 1957, p. 1106-1108.

Methods of improving test blocks for relaxation tests including improved clamping, extension of gage length and use of polished platinum fillets with focusing grooves. Good reproducibility with method. (Q3a)

392-Q.* (Czech.) **Relaxation Testing Machines.** Radovan Pech, Petr Jeh-

licka, Jaroslav Sorm and Jaroslav Viso. *Hutnické Listy,* v. 12, no. 12, 1957, p. 1103-1106.

Principles of spring-loading and moving-load creep testing machines, relaxation tests made on both machines with Skoda T56 material during 1000 hr. at 500° C. and 30 kg. per sq. mm. starting stress. Results from different machines varied by only 0.6 kg. per sq. mm. (Q3a)

393-Q. (Czech.) **Tests Made With Relaxation Rings.** Jaroslav Kermes. *Hutnické Listy,* v. 12, no. 12, 1957, p. 1108-1111.

Tests made with ring of constant diameter with required stress induced into the rings by inserting a wedge. Tensometric measurements showed that the value of the stress and displacement on the circumference of the ring agree with theoretical calculations. Method compared to other creep tests. (Q3a)

394-Q. (Czech.) **Importance of Hot Stress Relaxation Study in Machine Parts of More Complex Form.** Jaroslav Nemec. *Hutnické Listy,* v. 12, no. 12, 1957, p. 1111-1115.

Importance of creep tests for calculating stress values in machine parts exposed to elevated temperatures. Principles, present theoretical state and experimental techniques for study of hot relaxation. Influence of form of complex machine parts on relaxation ratio; relation to processes existing in a complex metal structure. (Q3a)

395-Q.* (German.) **A Contribution to the Knowledge of Wear-Resistance of Bainitic-Hardened Cast Iron.** Richard G. Walzel and Hermann Ortner. *Wear,* v. 1, Dec. 1957, p. 183-195.

Structure and properties of two grades of cast iron after isothermal transformation in the tempering range of bainitic hardening. Compares wear resistance and other properties to the same grades of cast iron with a martensitic structure. Wear resistance for the lower bainitic hardening range (350° C.) is superior to normal hardened and tempered iron. 9 ref.

404-Q.* Selection of Steels for Springs. H. J. Elmendorf. *Metal Progress,* v. 73, Apr. 1958, p. 80-84.

Mechanical properties of spring wire and springs; by knowing the wire tensile strength, the spring design stress can be predicted and the proper spring steel can be selected.
(Q21, Q23b, Q27a; ST, SGA-b)

405-Q.* Tear Test for Titanium Sheet. C. W. Vigor and J. R. Hornaday, Jr. *Metal Progress,* v. 73, Apr. 1958, p. 103-107.

Small coupons are torn by a conventional tensile testing machine. The amount and duration of applied force are recorded and used to determine the work required for tearing. Resulting data measure effect of hydrogen embrittlement and thermal instability.
(Q26q, Q26s, 1-54; Ti, *H*)

406-Q. (German.) **Determination of Notched-Bar Toughness Using Small Test Specimens.** Vladimir Komarek. *Acta Technica,* v. 3, Jan. 1958, p. 26-57.

(Q6)

407-Q.* (German.) **Testing Devices and Testing Procedures for Extended Creep of Steel Subjected to Elevated Temperatures.** K. G. Olsson. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 679-685.

A testing device was designed which resulted in a homogeneous distribution of stresses in the specimens. The elongation was measured and recorded accurately with gages. (Q3, 1-53)

408-Q. (German.) **Results of Extended Creep Tests on Ferritic and Austenitic Steels Subjected to Elevated Temperatures.** André Constant. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 695-702.

Creep tests in France on a large number of steels conventionally used for high-pressure steam pipes, for steel castings and for large forgings. (Q3; ST)

409-Q.* (German.) **Results of Creep Tests on Material for Steel Pipes. Determination of Design Characteristics Such as Tensile Strength.** Fritz Eberle. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 702-706.

Temperatures between 455° C. and 980° C. were chosen for the tests and the time was up to about 40,000 hr. The previous heat treatment was varied as to hardening temperatures, quenching and annealing conditions. The strain-time curves on some steels show a distinctive bend at a certain point, indicating a structure transformation. Unless rupture occurred the curves remain straight thereafter in double logarithmic representation.
(Q3, Q27a, 17-51; SS, SGA-h)

410-Q.* (German.) **Development of High-Temperature Steels and Their Testing in Czechoslovakia.** Jaroslav Pluhar. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 707-710.

Creep tests were carried out at 550° C. on steel castings (0.1% C, 0.5% Cr, 0.8% Mo, and 0.1 to 1.5% Ni) and (0.1% C, 0.5% Cr, 0.8% Mo, 0.25% V), and (0.1 to 0.6% Ni). The steel was hardened at 1100° C., quenched in oil and annealed at 720° C. for 6 hr. Notched and unnotched specimens were investigated. In tests up to 20,000 hr., no disadvantageous effects of the Ni content were observed. The embrittlement of Ni steels formerly observed and a frequent cause of rejection can be attributed to improper heat treatment. 30 ref.
(Q26s, 2-60, 2-64; AY, SGA-h, 5-60)

411-Q.* (German.) **Variations of Creep Velocity in a Carbon Steel Subjected to Creep Tests.** Axel Johansson. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 712-715.

On a normalized carbon steel with 0.16% C the creep curve was recorded at 450° C. up to 21,000 hr. The creep velocity was derived from the creep curve and plotted in a diagram. The velocity curve is of an irregular shape and does not lend itself for extrapolation for longer times. Annealing at 600° C. did not show more satisfactory results. (Q3; CN)

412-Q.* (German.) **Scattering of Results of Extended Creep Tests at Elevated Temperatures.** Wilhelm Schlüter. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 717-719.

Samples of Cr-Mo pipe steel were taken from different steel mills and different heats and subjected to

creep tests up to 40,000 hr. at 550° C. The scattering of results amounted to ±20% about the mean. Therefore, it may be advisable for design purposes to give the mean as the main characteristic and also the maximum observed deviations. This eliminates the troubles of testing each individual heat. (Q3, 1-54; SS)

413-Q.* (German.) **Creep Tests With Small Specimens and Their Evaluation.** Alfred Keller and Werner Stauffer. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 719-726.

For large-scale creep test, space and furnace requirements became excessive. Therefore, a small specimen was developed and a large number of tests were carried out on low and high-alloy steels (12 to 25% Cr, 8 to 20% Ni, 3% Mo and 7% Co). The results for the same alloy but from different heats were represented on stress-time diagrams, showing the disposition range and on the lower boundary the minimum requirements. 6 ref. (Q3, 1-60; AY, SS)

414-Q.* (German.) **Statistical Evaluation of Results From Extended Creep Tests at Elevated Temperatures as a Means for the Determination of Minimum Requirements.** Hans Zschokke. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 726-730.

Statistical evaluation methods were applied on 200 samples of steel (3% Cr, 0.6% Mo, 0.3% V, 0.5% W) subjected to stresses of 30, 22 and 20 kg. per sq. mm. at 550° C. Means, standard deviations and confidence ranges were calculated. Tests on single specimens can be extremely unreliable, and short-time tests should be conducted on a large number of specimens from the same material. (Q3, 1-54, S12)

415-Q.* (German.) **Observations on Electrically Conductive Rubber Models. Useful for the Explanation of Processes Occurring in Strained Metals.** W. Spath. *Metall,* v. 11, Oct. 1957, p. 859-863.

Measurement of electric conductivity and its variation on rubber models. Internal stresses in microscopic areas observed and explained through molecular rearrangements, indicating similar phenomena in metals. Behavior under static and periodic loads was recorded by electric means permitting much finer observations than the mechanical instruments conventionally used. 4 ref. (Q25, 1-54)

429-Q.* Effects of Cold Rolled Threads on the Properties of High Temperature Chromium-Molybdenum Steel Threads. J. W. Jenkins, W. L. Williams and J. L. Herring. *Bureau of Ships Journal,* v. 6, Feb. 1958, p. 7-12.

Room-temperature tension tests and elevated-temperature creep relaxation tests were performed on Cr-Mo steel bolt studs to compare the effects of cut threads and cold rolled threads. The thread rolling produced a significant reduction in proof stress which could largely be recovered by stress relief. The yield strength was not similarly affected, at least to any large extent. The relaxation properties were independent of the threading procedure and of the stress-relief treatment used to improve the proof stress. The results indicated that the yield strength had gretaer utility than the proof test for specification acceptance testing.

431-Q.* Use of Paraffin Wax as a Model Material to Simulate the Plastic Deformation of Metals. Pt. 2. Practical Applications of This Technique. J. W. Barton, C. Bodsworth and J. Halling. *Iron and Steel Institute, Journal,* v. 188, Apr. 1958, p. 321-331.

Use of paraffin wax for study of several metal forming operations. Close correlation obtained between theoretical and practical conditions for direct extrusion with lubricated and rough dies. A wide range of practical friction conditions can be obtained by suitable choice of the deforming surfaces. Effects of extrusion temperature gradient in the billet. Technique extended to the deformation of material passing through a commercial rolling mill. 17 ref. (Q23q, F23, F24, 17-56)

432-Q.* How Grinding Affects Fatigue Strength. L. P. Tarasov. *Metalworking Production,* v. 102, Feb. 21, 1958, p. 323-327.

Recent studies show that good commercial grinding practice does not lower fatigue limit despite high tensile stresses. Severe grinding caused some drop in fatigue limit. When grinding oil was used, surface was strengthened enough to raise the fatigue limit. High residual tensile stresses were associated with smaller drop in fatigue limit. Residual grinding stresses were not reduced measurably as a result of fatigue testing. Fatigue limits of all hardened steels are likely to benefit from the cold working of the surface, during grinding. 8 ref.

433-Q.* Creep of Aluminum-Copper Alloys During Age Hardening. E. E. Underwood, L. L. Marsh and G. K. Manning. *National Advisory Committee for Aeronautics,* Technical Note 4036, Feb. 1958, 73 p.

Interrelation of aging during creep and creep during aging studied in polycrystalline Al alloys containing 1 to 4% Cu. Experimental procedures included interrupted creep tests, tensile tests of creep specimens, quantitative metallographic determination of precipitation during creep, hardness measurements on unstressed and stressed aged alloys, X-ray studies of deformation in the crystalline lattice, and microscopic examination of the

surface deformation markings. 40 ref. (Q3, N7a; Al-b, *Cu*)

434-Q. Mechanism of Boundary Lubrication and the Properties of the Lubricating Film. Short and Long-Range Action in the Theory of Boundary Lubrication. B. V. Deryaguin, V. V. Karassev, N. N. Zakhavaeva and V. P. Lazarev. *Wear,* v. 1, Feb. 1958, p. 227-290.

Two versions of the blow-off method, by which the dependence of the viscosity of oils and other non-volatile fluids on the distance from the solid wall can be measured, and the viscosity localized with an accuracy of 10 Å. Mechanical properties of the boundary lubrication layer explain both the existence of static friction and the observation of the two-term friction law derived from the molecular theory of friction. 28 ref. (Q9, NM-h)

435-Q. Extreme-Pressure Lubricating Properties of Some Sulphides and Disulphides, in Mineral Oil, as Assessed by the Four-Ball Machine. W. Davey and E. D. Edwards. *Wear,* v. 1, Feb. 1958, p. 291-304.

Disulphides are superior to monosulphides as extreme-pressure additives; mechanism of action of these compounds. 14 ref. (Q9, 18-73, NM-h)

436-Q. Wear of Metals. F. T. Barwell. *Wear,* v. 1, Feb. 1958, p. 317-332.

Phenomena associated with rolling contact, scuffing, fretting, corrosion, simple sliding with and without oxygen. Examples of practical cases. 14 ref. (Q9)

437-Q. Review of the Friction of Solids. F. P. Bowden. *Wear,* v. 1, Feb. 1958, p. 333-346.

439-Q.* (Czech.) Study of the Dynamic Impact Test. Ales Vetiska and Antonin Till. *Hutnické Listy,* v. 13, Jan. 1958, p. 37-42.

Deformation characteristics of dynamically stressed material are obtained by piezo-electric transmission of sudden forces with the oscillograph. Calculations based on permanent deformation of test rods submitted to impact show that the development of dynamic forces dependent on deformation is similar to that obtained with the oscillograph, the calculated forces being higher. 7 ref. (Q6, 1-54)

440-Q. (French.) Brinell Hardness of Castings. J. Van Eeghem. *Fonderie Belge,* v. 28, Feb. 1958, p. 58-60. (Q29, 5-60)

441-Q.* (French.) Research on Hot Deformation of Steels. Pt. I. Development of Variable-Speed Hot-Torsion Testing Machine. Hot Torsion Tests; First Results. C. Rossard and P. Blain. *Institut de Recherches de la Siderurgie (IRSID), Publications,* Series A, no. 174, Oct. 1957, 88 p.

Specimens of 0.25% carbon steel, 18-8 stainless and 25% Cr steel were tested in specially designed apparatus to provide experimental data for theories of plasticity at recrystallization temperatures and to establish relationships between composition and structure of steel, load, speed of deformation, type of deformation and temperature. 22 ref. (Q1, 1-53, 1-66; ST)

442-Q. (French.) Study of Metallic Parts. Strength of High Pressure Vessels. R. Epain. *Metallurgie et la Construction Mécanique,* v. 90, Feb. 1958, p. 97-105.

Cylinder was submitted to enough pressure to create permanent deformation. (To be continued.) (Q24, 3-74, T26q)

443-Q.* (French.) Relationships Between Sub-Zero and Hot Brittleness in 18-8 Stainless Steels. Andre Gueussier and René Castro. *Revue de Metallurgie,* v. 55, Feb. 1958, p. 107-122.

Carbide precipitations caused by tempering of austenitic steels are accompanied by brittleness at low temperatures and by a shift of impact-temperature curves toward higher temperatures. Analysis of this embrittlement reveals characteristics of these precipitations when steels contain Ti or Cb. Embrittlement at high temperatures is observed. Precipitates responsible for embrittlement can occur during course of deformation, and kinetics of their formation depends largely on composition and prior heat treat-

ment of steels. 21 ref.

(Q2g, 1-60; 7-52)

454-Q.* **Ductility and Energy Relations in Charpy Tests of Structural Steels.** J. H. Gross and R. D. Stout. *Welding Journal,* v. 37, Apr. 1958, p. 151s-159s.

Relationship of energy absorption in V-notch Charpy impact test to notch ductility. Evaluates ductility by measuring lateral expansion produced during deformation at side of specimen opposite notch. Influence of tensile strength on energy absorption and lateral expansion of ASTM alloys A203, A212, A285, A302, A387, and 48s5 HT HY65, T1, C-1032 steels. Use of lateral expansion data for determining ductile-to-brittle transition temperature. 18 ref.
(Q6, Q23s, Q23p; ST, SGB-a)

455-Q.* **The Behavior of Molybdenum Single Crystals Under Various Stress Conditions.** R. Maddin. Paper from "The Metal Molybdenum", American Society for Metals, p. 214-240.

Growth of Mo single crystals; appearance of slip lines; structural changes of deformation; effect of bending on resistivity; determination of slip elements; rolling and recrystallization. 6 ref.
(Q24, N3r; Mo, 14-61)

456-Q.* **Ductile-to-Brittle Transition in Molybdenum.** J. H. Bechtold and E. T. Wessel. Paper from "The Metal Molybdenum", American Society for Metals, p. 241-261.

A ductile-to-brittle transition is a general characteristic of body-centered cubic metals, and the transition temperature of Mo is within the range expected as based on correlations with the melting point or, more accurately, with the modulus of elasticity. There appears to be little chance of eliminating the tendency for brittle behavior in Mo, or for greatly reducing the minimum temperature range of its occurrence

by known practical metallurgical techniques. 6 ref. (Q23r; Mo)

457-Q.* Effects of Oxygen, Nitrogen, and Carbon on the Ductility of Wrought Molybdenum. H. S. Spacil and J. Wulff. Paper from "The Metal Molybdenum", American Society for Metals, p. 262-280.

Adjusting the balance of carbon, oxygen and nitrogen in commercial Mo. Vacuum annealing and zone refining for stabilizing Mo are useful only for research purposes. Of far greater practical importance is stabilization by small alloy additions of such highly reactive metals as Ti, Zr and Hf. Such additions raise the recrystallization temperature 390° F., increase the hot strength, and reduce the possibility of embrittlement in the temperature range 2730 to 3810° F. 32 ref. (Q23p, 2-60; Mo)

458-Q.* Effects of Hot-Cold Work on the Properties of Molybdenum Alloys. R. Q. Barr, M. Semchyshen and I. Perlmutter. Paper from "The Metal Molybdenum", American Society for Metals, p. 462-510.

Molybdenum alloyed with 0.28% Cb or 0.5% Ti was strain hardened when rolled or forged at temperatures up to 2400° F. The hardness produced by a given amount of deformation varied with the deformation temperature. Provided no recrystallization occurred during deformation, the higher the working temperature in the range 1800 to 2400° F. the higher the hardness of the wrought structure. 3 ref. (Q29n, 3-68, 2-61; Mo-b)

459-Q. Effect of Structure of Titanium-Tungsten Carbide Compositions on the Life of Tool Tips. P. K. Mikhailova. *Stanki i Instrument,* v. 28, no. 6, 1957, p. 26. (Henry Brutcher, Altadena, Calif., Translation no. 3966.)

462-Q.* (English.) Ferrito-Pearlitic Steels for the Construction of Steam Turbines. R. Pokorny, T. Buzek and T. Kermes. *Czechoslovak Heavy Industry,* no. 2, 1957, p. 22-29.

Results of creep relaxation, fatigue and corrosion tests on ferrito-pearlitic steels of Czech formulation including Skoda T56, HDT, TBW 50, TBMO 50, HDM, TBV40, and N10. (Q3, Q7, R-general, W11k, 17-57; ST)

463-Q.* (Czech.) Ductility Evaluation of Steels Cast in Vacuum. Vladimir Hasek. *Hutnické Listy,* v. 13, Mar. 1958, p. 221-226.

Ductility of steels cast in the usual way, those cast under vacuum and those exposed to vacuum during and after casting was tested with equipment intended for torsion testing. Vacuum cast steel, owing to its fine-grained structure and less developed dendritic structure in the as-cast state, has better ductility even at higher degree of forging than cast steel in the usual way. (Q23p, D8m; ST)

464-Q. (Czech.) Properties of Wrought Iron After Service in Railway Bridges. Jaroslav Sorm. *Hutnické Listy,* v. 13, Mar. 1958, p. 226-230.

Tests on old material used for bridge construction show that strength values are satisfactory when stressed in tension. 7 ref. (Q23, Q25, T26p; 17-57; Fe-m)

465-Q. (Dutch.) Copper and Copper Alloys. Pt. 17. W. G. R. Jager. *Metalen,* v. 13, no. 5, 1958, p. 92-96.

Tabulated results of microhardness measurements made on an English plastic bronze (6% Sn, about 3.5% Pb), an American plastic bronze (agreeing in composition with the German bronze MSnBz4Pb, DIN 17662), a Ni-Al cast bronze (11% Al, some Mn and Fe), and a Ni-Al plastic bronze (9-10% Al, 1-3% Ni, several % Fe). (Q29q; Cu-s)

466-Q.* Effect of Hydrogen on the Fatigue Properties of Titanium and Ti-8 Pct Mn Alloy. L. W. Berger, W. S. Hyler and R. I. Jaffee. *AIME Transactions,* v. 212, Feb. 1958, p. 41-45.

Additions of 390 ppm. hydrogen to A-55 Ti and 368 ppm. to 8% Mn alloy have no deleterious effect on the unnotched and notched rotating-beam fatigue properties. These amounts of hydrogen are sufficient to cause severe notch-impact em-

brittlement in A-55 Ti and pronounced loss of tensile ductility in 8% Mn alloy. Lack of embrittling effect in fatigue in the latter alloy is consistent with the postulated strain-aging mechanism of hydrogen embrittlement in alpha-beta alloys. 14 ref. (Q7, Q26s; Ti-b, *H*)

467-Q.* Anomalous Behavior During Cold Working and Subsequent Heating of Certain Magnesium Base Alloys. J. C. McDonald. *AIME Transactions,* v. 212, Feb. 1958, p. 45-46.

Magnesium alloy with 1.5% Mn and 0.2% Ce (mischmetal) was cold rolled 60%, starting from 0.040 in. Studies show considerable hardening in as little as 3 min. at 400° F. (e.g., tensile yield strength increased 50%). Softening at higher temperatures is easily explainable in terms of observed recrystallization. There is no explanation of the work softening, followed by the anneal hardening. 8 ref.
(Q-general, 2-64, 3-68; Mg-b)

468-Q.* Effect of Crystallographic Orientation and Oxygen Content on Knoop Hardness Values of Iodide Titanium. C. Feng and C. Elbaum. *AIME Transactions,* v. 212, Feb. 1958, p. 47-50.

Knoop hardness measurements were carried out on large grains of iodide titanium containing different amounts of oxygen. For each oxygen content the hardness is recorded as a function of the crystal orientation and of the angle ϕ between the indenter diagonal and the projection of the C (hexad) axis in the surface. 9 ref. (Q29, 3-72; Ti)

469-Q.* Hydrogen Embrittlement of Vanadium by Catalytic Decomposition of Water With Manganese. B. W. Roberts, G. W. Sears and P. D. Zemany. *AIME Transactions,* v. 212, Feb. 1958, p. 71-73.

Vanadium metal is embrittled by hydrogen at a temperature as low as 250° C. when held in the presence of Mn metal and water vapor in a rough vacuum. Property changes are caused by the catalytic decomposition of water vapor at the V surface and the diffusion into and solution in the V of the resultant hydrogen. Mn is a necessary component of the catalyst. 9 ref.
(Q26s, 2-63, P13c; V)

470-Q. Fracture of Temper Brittle Steel. L. D. Jaffe and D. C. Buffum. *AIME Transactions,* v. 212, Feb. 1958, p. 73-74.

Alloy steels display two forms of temper brittleness, which may be called upper-nose and lower-nose. Upper-nose can be distinguished from lower-nose temper brittleness by visual inspection of the fractured surface of specimens broken under such conditions that the fracture is brittle. 5 ref. (Q26s; ST)

471-Q. Rectangular Cracking in Lead. K. U. Snowden and J. N. Greenwood. *AIME Transactions,* v. 212, Feb. 1958, p. 91-92.

The rectangular pattern found in lead fatigue failures can be caused by boundary migration. Boundaries which have reached a location making a 45° angle with the stress are particularly subject to atmospheric attack. A crack starts and this locks the boundary from further migration. (Q7, M27f; Pb)

472-Q. Anelastic Measurements on the Alloy Cu_3Au. W. A. Goering and A. S. Nowick. *AIME Transactions,* v. 212, Feb. 1958, p. 105½-106.

Measurements of the internal friction as a function of temperature were made in a torsion pendulum. 7 ref. (Q22, 2-61; Cu, Au)

473-Q.* Effect of Composition and Heat-Treatment on the Uniform Elongation and Flow Properties of Alpha-Beta Titanium Alloys. A. J. Griest, H. A. Robinson and P. D. Frost. *AIME Transactions,* v. 212, Feb. 1958, p. 117-121.

Flow characteristics and uniform elongation of alpha-beta Ti alloys in the solution treated condition are markedly affected by the solution temperature. Two classes of alpha-beta alloys were distinguished, based on the effect of solution temperature on the uniform elongation. Martensitic alpha-beta alloys, which are relatively weakly beta-stabilized, showed decreasing values of uniform elongation as the solution temperature was initially increased.
(Q24, 2-60, 2-64; Ti-b)

474-Q.* Twinning and Cleavage in Tantalum. C. S. Barrett and R. Bakish. *AIME Transactions,* v. 212, Feb. 1958, p. 122-123.

Impact deformation of Ta sheet produces twins at −196 but not at −77 or 25° C. The twins are on {112} planes. Small amounts of crystallographic cleavage were observed under impact at −196° C. Cleavage facets were chiefly on {110} planes. (Q24b, Q26n; Ta-a)

475-Q.* Tensile Strength of Sintered Iron Powder as a Function of Sur-

face Area and Particle Shape. P. R. Basford and S. B. Twiss. *AIME Transactions,* v. 212, Feb. 1958, p. 124-130.

Relationship between areas of iron powders, briquettes and sintered compacts and tensile strength. Two types of areas exist in such powders —a macroscopic area due to the shape and size of particles and a microscopic area due to pores and cracks in the surface. Only the macroscopic area, specifically the area due to particle irregularity, contributes to tensile strength. 16 ref. (Q27a, H12j; Fe, 6)

476-Q.* Theory of Brittle Fracture in Steel and Similar Metals. A. H. Cottrell. *AIME Transactions,* v. 212, Apr. 1958, p. 192-203.

Fracture and plastic deformation; theory of the yield point; nucleation of cracks by slip; ductile-brittle transition in unnotched tensile specimens; notch brittleness. (Q26s, Q23r; ST)

477-Q.* Activation Energies for Creep of Single Aluminum Crystals Favorably Oriented for (111) [101] Slip. J. L. Lytton, L. A. Shepard and J. E. Dorn. *AIME Transactions,* v. 212, Apr. 1958, p. 220-225.

Creep of single Al crystals occurs by three unique processes, characterized by three distinct and isolatable activation energies: The 35,000-cal-per-mole activation energy obtained at the highest temperatures was ascribed to a dislocation climb process; the 28,000-cal-per-mole activation-energy process, occurring over the intermediate-temperature range, was attributed to a cross-slip mechanism; and it was suggested that the 3400-cal-per-mole process observed below 400° K. may be the Peierls energy. 17 ref. (Q3, P13a; Al, 14-61)

478-Q.* Effect of Surface Films on Cadmium Crystals. M. Metzger and T. A. Read. *AIME Transactions,* v. 212, Apr. 1958, p. 236-243.

Strengthening effects of hydroxide and synthetic plastic films in the creep of Cd crystals studied. Results were broadly consistent with the naive mechanical model. Dislocation-film reactions and the significance of macroscopic stresses associated with certain films. 29 ref. (Q3, 3-66; Cd)

479-Q. A Method for Observing the Progress of Deformation in Tensile Samples. A. P. Young and L. L. Marsh. *AIME Transactions,* v. 212, Apr. 1958, p. 247-249.

Use of plastic replicas taken from a tensile sample of uranium during testing. Record of deformation can be made as nearly continuous as is desirable by taking replicas at small strain intervals. (Q27, M20r; U)

480-Q.* Ductility of Silicon at Elevated Temperatures. D. W. Lillie. *AIME Transactions,* v. 212, Apr. 1958, p. 249-251.

Considerable ductility exists in bulk specimens of polycrystalline high-purity Si. The possibility of hot forming at 1200° C. is suggested. 5 ref. (Q23p, 2-62; Si)

481-Q.* Observations on Homogeneously Bent Silicon Crystals. U. F. Kocks. *AIME Transactions,* v. 212, Apr. 1958, p. 251-252.

Single slip and a single parallel array of edge dislocations have been obtained in Si single crystals by homogeneously bending them in a four-point dead-loading device at 1000° C. around the [211] axis with [251] as the tensile axis which encloses an angle of 40° with the glide plane. 7 ref. (Q24a, M26b; Si)

482-Q.* The Temperature Dependence of Flow and Fracture in Coated Zinc Single Crystals. L. C. Weiner. *AIME Transactions,* v. 212, Apr. 1958, p. 253-256.

For Zn single crystals, $X_o = 3°$, a surface coating raises both the cleavage and yield strengths over a large temperature range. The "brittle temperature", associated with slip after completion of twinning, does not coincide with the point of intersection of the flow and cleavage curves, which is associated with twinning. A surface film has no effect on the brittle temperature. 9 ref. (Q24, Q23r, Q26s; Zn, 14-61)

483-Q.* Pyramidal Slip in Magnesium. R. E. Reed-Hill and W. D. Robertson. *AIME Transactions,* v. 212, Apr. 1958, p. 256-259.

Slip on $\{1122\}$ planes, which do not contain a close-packed direction, has been identified on crystals strained at −190° C. Evidence also shows that $\{1011\}$ pyramidal slip is a mode of deformation at 25° C. in a limited orientation range. 10 ref. (Q24a; Mg)

484-Q.* Size Effects in the Deformation of Aluminum. R. L. Fleischer and Bruce Chalmers. *AIME Transactions,* v. 212, Apr. 1958, p. 265-274.

Aluminum single crystals and bicrystals of various cross-sectional dimensions were deformed in tension. Typical stress-strain curves; effects of changes in crystal dimensions; effects of growth rate used in preparation of crystals. Macroscopic constraints at a grain boundary are responsible for the most prominent grain-boundary effect, the production of multiple slip. 41 ref. (Q24, M27f; Al, 14-61)

485-Q.* Detection of Fatigue in Metals. R. F. Hanstock. *British Journal of Applied Physics,* Supp. 6, 1957, p. S48-S50.

Brief review of the nature of fatigue and of the methods employed to detect development. Potential value of these methods as primitive nondestructive tests to reveal fatigue in its least dangerous stage (i.e., prior to the development of serious structural weakness). 13 ref. (Q7, 1-54)

486-Q. Structural Changes and Energy Dissipation During Fatigue in Copper. N. Thompson and N. J. Wadsworth. *British Journal of Applied Physics,* Supp. 6, 1957, p. S51-S55.

5 ref. (Q7, M27; Cu)

487-Q. Measurement of Elastic Constants by the Ultrasonic Pulse Method. M. F. Markham. *British Journal of Applied Physics,* Supp. 6, 1957, p. S56-S63.

6 ref. (Q21, 1-74)

488-Q. Alloy Resists Jet Heat. *Chemical and Engineering News,* v. 36, May 19, 1958, p. 48-50.

Nickel-chromium-tungsten alloy can increase operating temperature to 1800° F. (Q-general, 2-62, T24b, 17-57; SGA-h, Ni, Cr, W)

489-Q. Super-Strength Alloys. *Design News,* v. 13, Mar. 1958, p. 100-101, 102.

Chart compiled by ASTM showing chemical composition and rupture strength at 1000 psi. of various alloy systems. (Q3m; SGB-a)

490-Q. Brittle Fracture. G. M. Boyd. *Engineer,* v. 205, Jan. 31, 1958, p. 174-175.

General discussion; conditions under which brittle fracture occurs; effect of temperature and welding and remedial measures. (Q26s)

491-Q. Brittle Fracture in Steel as Related to Flash-Welded Line Pipe. Pt. 2. M. A. Scheil, G. E. Fratcher, S. L. Henry and E. H. Uecker. *Engineering Journal,* v. 41, Mar. 1958, p. 59-63.

Concepts of brittle fracture for 0.20% to 0.30% C, medium Mn steel. 9 ref. (Q26s, T28p; ST, 1-57)

492-Q. A Qualitative Separation of Wear Factors. L. Rozeanu and O. Preotescu. *Engineers Digest,* v. 19, Mar. 1958, p. 102-105. (From *Revue de Mecanique Appliquee,* v. 2, no. 1, 1957.)

Study of adhesive, corrosive, abrasive and fatigue wear. (Q9)

493-Q.* The Structure and Mechanical Properties of High-Purity Aluminum-Zinc-Magnesium Alloys. P. C. Varley, M. K. B. Day and A. Sendorek. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 337-351.

Super-purity-base alloys of Al, Zn and Mg, when quenched from 465° C. and naturally aged, showed a steady improvement in mechanical properties with a decrease in ductility. As the alloying content and the time of aging were raised the fractures became increasingly intercrystalline and brittle. With a standard artificial aging treatment of 16 hr. at 135° C. there was again a steady rise in tensile strength and proof stress with increasing alloying additions, and a maximum was reached with 9% addition. 7 ref. (Q-general, N7a; Al-b, *Zn, Mg*)

494-Q.* . A New Investigation of Anomalies in Chromium. H. Pursey. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 362-368.

Elasticity measurements on samples of pure and impure Cr from −200 to +150° C. Elastic anomaly is interpreted as a change in volume of the material at a certain temperature, which is a function of the stress on the material. Hence, if the temperature of a specimen is fixed and the stress varied, an anomalous expansion or contraction occurs as the material changes from its modified to its unmodified form. 17 ref. (Q21; Cr)

495-Q. Study of Metal-Working Processes. Non-Homogeneous Deformation of Material. *Iron and Coal Trades Review,* v. 176, Feb. 14, 1958, p. 393-395.

Survey of available methods of studying nonhomogeneous deformation in metals. (Q24f, F-general)

496-Q. Measurements of Quenching Stresses in a Bearing Ring by Interference Fringes. Toshio Mura and

Hiroshi Yoshimoto. *Journal of Applied Physics,* v. 29, Feb. 1958, p. 115-119. 6 ref. (Q25h, J26, T7d)

497-Q. Internal Friction in Aluminum at Low Temperatures. A. J. Filmer, G. J. Hutton and T. S. Hutchison. *Journal of Applied Physics,* v. 29, Feb. 1958, p. 146-148. 7 ref. (Q22, 2-63; Al)

498-Q. Vickers Hardness and Compressive Strength. D. S. Dugdale. *Journal of Mechanics and Physics of Solids,* v. 6, 1958, p. 85-91.

Hardness and compression tests are reported for a wide variety of materials. A simple empirical method for relating hardness number to the stress-strain curve is suggested. The correlation obtained leads to the conclusion that the Vickers test is not at all sensitive to yield stresses corresponding to compressive strains greater than 0.15. 8 ref. (Q29, Q28)

499-Q.* Propagation of Fatigue Cracks in Sheet Specimens. N. E. Frost and D. S. Dugdale. *Journal of Mechanics and Physics of Solids,* v. 6, no. 2, 1958, p. 92-110.

Fatigue tests on mild steel, Al alloy and Cu sheet specimens containing a small central slit. Growth of the fatigue cracks initiated by the slit was measured as the test proceeded. In some of the mild steel specimens a plastic zone was visible around the growing crack. Measurements of the plastic zone showed that a state of geometrical similarity existed between the crack length and plastic zone dimensions. For low stresses the crack growth was sometimes erratic, but the rate of growth was proportional to the current crack length. 14 ref. (Q7; 4-53, 9-72, CN, Al, Cu)

500-Q. Basal Slip in Zinc Under Static and Dynamic Loading. T. Vreeland, Jr., D. S. Wood and D. S. Clark. *Journal of Mechanics and Physics of Solids,* v. 6, no. 2, 1958, p. 111-126.

Stress required to produce a given permanent basal shear strain in single crystals of Zn is much greater under dynamic than static conditions. 10 ref. (Q24a; Zn, 14-41)

501-Q. Effect of Friction on Compression and Indentation Between Flat Dies. J. F. W. Bishop. *Journal of Mechanics and Physics of Solids,* v. 6, no. 2, 1958, p. 132-144. 8 ref. (Q9p, Q28g, W22a)

502-Q.* Factors Affecting Residual Stress in Electrodeposited Metals. Joseph B. Kushner. *Metal Finishing,* v. 56, Apr. 1958, p. 46-51.

Residual stresses in electrodeposited metals vary with deposit thickness. Stress is usually high at first and then diminishes to a constant value in the neighborhood of 0.001 to 0.002-in. deposit. Test runs were made and typical results are plotted. (To be continued.) (Q25h; 8-62)

503-Q.* Factors Affecting Residual Stress in Electrodeposited Metals. Pt. 2. Joseph B. Kushner. *Metal Finishing,* v. 56, May 1958, p. 82-87.

Variation of residual stress with thickness and temperature, effect of current density, and of contaminants and addition agents, regarding deposit of Ni films on Cu. (Q25h; 8-62, Cu, *Ni*)

504-Q.* Creep Properties of Three Copper Alloys. J. McKeown and R. D. S. Lushey. *Metal Industry,* v. 92, Apr. 25, 1958, p. 327-329.

Creep properties of gunmetal (85% Cr, 5% Zn, 5% Sn, and 5% Pb) and 60-40 brass, hot stamped at 700 and 800° C., were examined. Tensile strength, 0.1% proof stress, elongation, Young's modulus, and hardness. (Q3, Q-general; Cu-b)

505-Q.* Alloys of Titanium and Zirconium Containing Tin. R. F. Smart. *Metallurgia,* v. 57, Apr. 1958, p. 181-188.

Literature review. Phase diagram, oxidation resistance, high-temperature strength, creep properties, hardness and other mechanical properties of Zr and Ti alloyed with Sn. 30 ref. (Q-general, M24; Ti, Zr, *Sn*)

506-Q.* "Size" Effects and Their Possible Significance for "Non-Propagating" Cracks in Metal Fatigue. W. J. Harris. *Metallurgia,* v. 57, Apr. 1958, p. 193-197.

Relationship of fatigue strength to an intrinsic block structure or "flaw" pattern in polycrystalline solids. Elements of crystalline slip; significance of intrinsic flaw patterns in explaining "size" effects, and non-propagating effects in fatigue of metals. 15 ref. (Q7)

507-Q.* Coming: Better Thermenol Alloys. W. J. Buehler and C. G. Dalrymple. *Metal Progress,* v. 73, May 1958, p. 78-81.

Iron-aluminum alloys with 3 to 4% Mo have excellent oxidation resistance and stress-rupture strength. With small additions of Zr and carbon to raise the mechanical prop-

erties and inhibit the grain growth, the alloys are useful for many high-temperature applications. 5 ref. (Q-general, P-general; SGA-h, Fe, Al)

508-Q.* Castings for Tougher Jobs. Carl F. Joseph. *Metal Progress,* v. 73, May 1958, p. 104-108.

Pearlitic malleable iron is opening up new horizons for cast parts in automotive and other applications. A new grade of higher hardness has been developed for parts requiring good wear resistance toughness in the as-machined state. Machinable castings, with even higher hardness—up to Brinell 400—are in the future picture.

553-Q. (French.) **Fatigue Failure Results on Fatigue Test Machine.** W. H. Munse. *Revue de la Soudure,* v. 14, no. 1, p. 59-62.

Fatigue failures of actual structures could furnish more realistic information than laboratory fatigue tests if sufficient indication is given as to forces, stresses and numbers of load cycles. Fatigue cracks recently observed on two 90-ton fatigue test machines constructed in 1940 and used at the University of Illinois. Concluded that soldered beams under bending stress subjected to more than several million load cycles may fail under relatively small nominal maximal stresses. Need for further study of the effect of residual stresses, and pre-existing microscopic flaws on the weld failure. (Q7k; 7-51)

554-Q. (German.) **Plastic Deformation of Carbides.** E. Bryjak, etc. *Fertigungstechnik,* v. 8, Feb. 1958, p. 60-65.

Tungsten carbides with Co content up to 25% were investigated under the action of applied stresses on special equipment. Diameter and depth of deformation; metallographic examination, X-ray studies. Results on carbides with Co content under 10% apparently refute the theory supported by Dawihl that no permanent distortion occurs. 16 ref. (Q24; W, 6-69)

570-Q.* **Direct Stress Fatigue Tests on Redux-Bonded and Riveted Double Strap Joints in 10 S.W.G. Aluminum Alloy Sheet.** S. Kelsey and J. B. Spooner. *Aeronautical Research Council,* C.P. no. 353, Dec. 1955, 48 p.

Bonded joints tended to fail by shear of the bond at the higher stress ranges and by tension of the sheet at the lower stress ranges. Riveted joints failed by tension across the first row of rivets in all cases, though tests on three-row riveted joints showed considerable improvement in endurance over those with two rows of rivets. Endurances were greater for bonded joints but with rather more scatter than for riveted joints, particularly where bond shear was the cause of failure.

610-Q.* Creep, Stress-Relaxation, and Metallurgical Properties of Steels for Steam-Power Plant Operating With Steam Temperatures Above 950° F. (510° C.) A. I. Smith, E. A. Jenkinson, D. J. Armstrong and M. F. Day. Digest from ASME Annual Meeting, Paper 57-A-225, Oct. 1, 1958. *Mechanical Engineering,* v. 80, Mar. 1958, p. 112-113.

Steels investigated were types suitable for turbine casing bolts, steam pipes, superheater tubes and cast components. They included Mo-V, Cr-Mo-V, Cr-Mo, and Cr-Ni-Cb (18-12-1). Methods of manufacture, chemical analyses, heat treatments and mechanical properties. (Q3m, Q-general, 2-62; AY, SS)

611-Q.* Creep Properties of Austenitic Nickel: Chromium Steels Containing Niobium. W. H. Bailey, M. G. Gemmill, H. W. Kirkby, J. D. Murray, E. A. Jenkinson and A. I. Smith. Digest from ASME Annual Meeting, Paper 57-A-254, Oct. 1, 1958. *Mechanical Engineering,* v. 80, Mar. 1958, p. 113.

Data relate to 16 heats of steel. On a rupture basis, the tests extend up to 8000 hr. at 1022° F., 42,000 hr. at 1202° F., 26,000 hr. at 1292° F., and 20,000 hr. at 1382° F. On the basis of 1% plastic strain data extend up to 32,000 hr. at 1112° F., 30,000 hr. at 1202° F., 12,000 hr. at 1292° F., and 14,000 hr. at 1382° F. Tests relate to wrought bars of small diameter (⅝ to 1 in.) and to a rotor forging. (Q3m, SS)

612-Q.* Croloy 15-15N. An Austenitic Heat-Resistant Alloy for Severe Tubular Applications at Elevated Temperatures. J. F. Ewing. Digest from ASME Annual Meeting, Paper 57-A-205, Oct. 1, 1958. *Mechanical Engineering,* v. 80, Mar. 1958, p. 113-114.

New alloy was developed for applications requiring strength properties in the 1200-1500° F. range. Chemical composition of Croloy 15-15N is similar to AISI Type 316 (16 Cr, 13 Ni, 3 Mo). Tungsten together with Mo and Cb-Ta has been added to a 15 Cr-15 Ni base for strengthening. Short-time tensile, creep-rupture, and creep properties of Croloy 15-15N. (Q3, Q27; SS)

613-Q.* Concentrated Wear of Turning Tools. V. Solaja. *Research,* v. 11, Apr. 1958, p. 152-156.

Concentrated tool wear in the form of grooves at boundaries of contact between tool and workpiece; effect of groove formation on surface finish; causes of concentrated tool wear, relation to fatigue. 24 ref. (Q9, T6n)

614-Q.* On the Contact Resistance Between Surface-Oxidized Metals in Repeated Sliding. Yasukatsu Tamai. *Wear,* v. 1, Apr. 1958, p. 377-383.

Steel and copper studied under natural and surface-oxidized conditions. With steel the trace of contact resistance during sliding fluctuated in both cases, but with Cu it was either smooth or fluctuating under natural or oxidized condition, respectively. Influence of oxygen content in the atmosphere on the nature of the oxide layer was also studied with tin. 4 ref. (Q9p; ST, Cu)

615-Q.* Report on Papers on Wear Presented at the Institution of Mechanical Engineers Conference. F. T. Barwell. *Wear,* v. 1, Apr. 1958, p. 418-445.

Discussion of conclusions reached in 40 papers read at the conference on lubrication and wear, London, England, October 1957. Subjects include wear, test methods, surface films, effect of temperature and environment, fretting and wear in engines. 10 ref. (Q9)

629-Q. Mechanical Properties of Some Ultra High Strength Steels. I. V. Paisov and Zo Yun Kho. *Metallovedenie i Obrabotka Metallov,* Feb. 1958, p. 2-6. (Henry Brutcher, Altadena, Calif., Translation no. 4140.)

The addition of tungsten to Cromansil steel increases its impact strength and resilience and makes it more suitable for machine parts. 6 ref. (Q-general, Q6, Q21, 2-60; AY, *Cr, Mn, Si, W*)

630-Q. Stress-Rupture Strength of Welds at High Temperature. A. V. Stanyukovich and V. K. Zemzin. *Metallovedenie i Obrabotka Metallov,* Feb. 1958, p. 12-18. (Henry Brutcher, Altadena, Calif., Translation no. 4147.)

(Q3m, 2-62; ST, 7-51)

631-Q. (English.) Internal Friction and Imperfections in Copper. D. H. Niblett and J. Wilks. *Bulletin de l'Institut International du Froid,* Supplement, Sept. 1956, p. 23-30.

Recent measurements on cold worked Cu and the information they reveal regarding behavior of both

dislocations and point defects. 7 ref. (Q22, M26s; Cu)

632-Q.* (English.) **Scratch Hardness. Pt. 1. Relation to Cold Working.** Tomiya Sutoki and Takeo Hikage. *Tohoku University, Science Reports of the Research Institutes,* Series A, v. 10, Apr. 1958, p. 85-96.

Scratch hardness was measured on single crystals and polycrystals of several metals. When the metal was cold worked, the change in the scratch width was very small, whereas indentation hardness conspicuously changed. Scratch hardness was considered to be related rather to the annealed state than to the extremely worked state of a metal. 6 ref. (Q29d, 3-68)

633-Q.* (English.) **Young's Modulus and Grain Size in Nickel-Copper Alloys.** Yuki Shirakawa and Ken'ichi Numakura. *Tohoku University, Science Reports of the Research Institutes,* Series A, v. 10, Apr. 1958, p. 110-119.

Young's modulus and the grain size have been measured in ten specimens of polycrystalline ferromagnetic Ni-Cu alloys annealed at 700, 800, 900, 1000 and 1100° C. With the addition of Cu, Young's modulus of Ni with comparatively small grains increased, whereas that with comparatively large grains decreased. (Q21a, M27c, 2-60; Ni, *Cu*)

634-Q. (French.) **High-Temperature Steels and Alloys.** P. Villian. *Metallurgie et la Construction Mecanique,* v. 90, May 1958, p. 345, 347-349, 351, 353, 355, 357-358.

Properties and high-temperature behavior of Fe-Cr, Fe-Ni-Cr and Ni-Cr alloys.
(Q-general, 2-62; SS, SGA-h)

635-Q.* (German.) **Torsion Fatigue Strength of Some Heat Treating Steels After Inductive Surface Hardening.** Franz Bollenrath. *Archiv für das Eisenhüttenwesen,* v. 28, Dec. 1957, p. 801-806.

Structure, Vickers hardness and torsion fatigue strength were tested over the entire cross section of specimen. Depth of hardening was from 0.16 to 3.5 mm. Fatigue strength rises with increasing depth. At depths up to 2.2 mm. however, the fatigue strength is lower than after annealing without surface hardening. 11 ref. (Q7h, 2-64; ST)

636-Q.* (German.) **Observation on the Velocity of Sound in Iron-Chromium-Carbon Alloys.** Alfred Fiedler. *Archiv für das Eisenhüttenwesen,* v. 28, Dec. 1957, p. 825-830.

Measurements on the velocity of sound were carried out on some Fe-Cr-C alloys by means of the supersonic-impulse-echo-method (water-interferometer). Results show a definite relation between sound velocity and carbon content. Formation of carbides and heat treatment seem to be of strong influence. 6 ref. (Q21f; Fe, *Cr*)

637-Q. (German.) **Importance of the Elastic Properties of Spheroidal Graphite Cast Iron in the Construction of Machines.** Cornelio Gianola. *Giesserei,* v. 45, Apr. 24, 1958, p. 210-219.

4 ref. (Q21a, Q21b, Q23; CI-r)

28 ref. (Q5, 1-53)

639-Q.* (German.) **Influence of Alloying Additives on the Friction Properties of Sintered Copper.** Wilhelm Hofmann and Gerhard Pieper. *Zeitschrift für Metallkunde,* v. 49, Feb. 1958, p. 80-86.

A special testing fixture for radial pressure application was designed. Friction forces were recorded and wear was determined gravimetrically and related to friction energy. Sintering pressure and temperature have no influence. Additions such as Sn, Zn, Fe and clay resulted in considerable wear and a high noise level. Raising Pb content decreased the noise. Copper-graphite specimens showed small wear, low noise levels and uniform friction constants. 16 ref. (Q9p, H15; Cu, 6-72)

640-Q.* (German.) **Mechanical Properties of Lead Alloys.** Erich Pelzel. *Zeitschrift für Metallkunde,* v. 49, Feb. 1958, p. 102-110.

Mechanical properties of Pb-Sb alloys, such as tensile strength, ultimate strain, hardness and the influence of alloying elements such as Sn, Sn-As, Cu, Ni, Bi, Cd, Li and Te. Age hardening effects of the various components. 9 ref.
(Q-general, 2-60, N7a; Pb, *Sb*)

650-Q.* **Metallurgical Factors in the Design of Hydraulic Equipment for Elevated Temperature Application.** A. Mars and N. M. Lazar. *American Society of Mechanical Engineers,* Paper no. 58-AV-11, 1958, 8 p.

Short - time high - temperature strength, creep - rupture, creep strength, fatigue strength, stress relaxation, thermal stress fatigue, thermal expansion and wear resistance discussed for toolsteels, cast iron, titanium, aluminum and magnesium alloys. 12 ref. (Q-general, 2-62; TS, CI, Ti-b, Al-b, Mg-b)

651-Q. **The Case Against the Tension Test.** *Australasian Manufacturer,* v. 43, Apr. 19, 1958, p. 52-57, 80-83.

Foundryman's case for the overevaluation of wrought metals by the elongation and reduction of area features of the tension test. (Q27)

652-Q. **The Mechanical Wear of Metals.** W. Hirst. *British Journal of Applied Physics,* v. 9, Apr. 1958, p. 125-132.

Main phenomena, the laws and the mechanisms of wear in unlubricated conditions, and the present state of development of theories of wear. 28 ref. (Q9)

653-Q. **Deformation of Solids at High Rates of Strain.** A. H. Cottrell. *Chartered Mechanical Engineer,* v. 4, Nov. 1957, p. 448-460.

44 ref. (Q24)

654-Q.* **Carbon-Manganese Steel.** J. Glen. *Iron and Steel,* v. 31, May 1958, p. 165-171.

Proof stress tests carried out at temperatures up to 450° C. on car-

bon-manganese steel in as-rolled condition, in normalized condition or after tempering for 2 hr. at 650° C. Steels were basic open-hearth, silicon killed or aluminum killed. Effect of Mn on proof stress values; relationship between proof stress at high-temperature and room temperature tensile strength; effect of silicon killing, yield phenomena, normalizing, microstructure on proof stress. (Q23b, Q27a, T26q, 2-60, 2-61, 2-64; ST-c, ST-e, 4-53)

655-Q.* Effect of Phosphorus on the Tensile and Notch-Impact Properties of High-Purity Iron and Iron-Carbon Alloys. B. E. Hopkins and H. R. Tipler. *Iron and Steel,* v. 31, May 21, 1958, p. 263-274.

Two important effects of adding phosphorus to iron are the much greater strengthening than obtained by comparable amounts of metallic alloying elements, and the progressive development of grain-boundary weakness which can be modified by heat treatment. For phosphorus contents above 0.05%, the transition temperatures in the Charpy impact test were high as a result of the enhanced yield stress and the reduction in brittle fracture stress arising from the weakening of the grain boundries.

(Q27a, Q6n, 2-60; CI, Fe-a, *P*)

656-Q. Creep of Pre-Strained Aluminum. *Metal Industry,* v. 92, May 23, 1958, p. 432, 434.

657-Q. Work-Hardening and the Initiation and Spread of Fatigue Cracks. N. F. Mott. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 145-147.

(Q7, Q23a, 9-72)

658-Q. The Mechanism of Work-Hardening and Slip-Band Formation. J. Friedel. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 147-159.

36 ref. (Q24c, Q23a, Q7)

659-Q. The Energy Stored in Fatigue of Metals. L. M. Clarebrough, M. E. Hargreaves and G. W. West. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 160-166.

7 ref. (Q7)

660-Q. Hardening and Softening of Metals by Cyclic Stressing. T. Broom and R. K. Ham. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 168-179.

New investigations of the hardening produced in annealed polycrystalline Cu and Al by alternating stresses applied at a frequency of 100 cycles per sec. and of such magnitude as to give complete fatigue failures in 2×10 cycles. 29 ref. (Q7, Q29)

661-Q. The Initial Fatigue Crack. G. C. Smith. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 189-197.

Formation of persistent slip bands during cyclic stressing and their development into fatigue cracks. In Cu and Al at low temperatures fatigue cracks appear to be formed in this way; at room temperature in Al they may form also along grain boundaries. 4 ref. (Q7; Cu, Al)

662-Q. Slip-Band Damage and Extrusion. P. J. E. Forsyth. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 198-202.

Slip-band extrusion was first observed in a fatigued 4% Cu aluminum alloy, but has now been found to occur in many other materials. It takes the form of a thin ribbon or scroll of the crystal material projecting as much as 20μ from the slip band. The thickness of the ribbon varies with different materials and fatigue conditions, that observed on the above alloy being less than 0.1μ. 6 ref. (Q24a)

663-Q. Extrusion and Intrusion by Cyclic Slip in Copper. A. H. Cottrell and D. Hull. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 211-213.

Extrusions and intrusions observed on slip bands in Cu fatigued at 300.90 and 20° K. A model based on a sequence of slip movements during a fatigue cycle is proposed to explain their formation. 4 ref. (Q24c; Cu)

664-Q. Some Observations on the Spread of Fatigue Cracks. N. E. Frost and C. E. Phillips. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 216-222.

Fatigue cracks after the stage of initiation; conditions under which continuous propagation does not occur. 13 ref. (Q7, Q26q)

665-Q. Speed Effect in Fatigue. P. G. Forrest. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 223-227.

It is usually found that the fatigue strength of metals is slightly reduced by decreasing the cyclic

speed, the reduction becoming greater with increase in temperatures between 200 and 300° C. In this range the fatigue strength is considerably greater at 10 cycles per min. than at 2000 cycles. It is thought that this behavior is caused by strain aging. 8 ref. (Q7, N7e)

666-Q* Plastic Deformation of Nickel Single Crystals at Low Temperatures. Peter Haasen. *University of Chicago, Institute for the Study of Metals, 48th Quarterly Report,* Pt. 1, Mar. 1958, 39 p.

Single crystals of Ni (purities of 99.98% and 99.4%) were deformed in tension at various temperatures between 4.2° K and 300° K. Shear stress-shear strain relations determined as well as reversible change of flow stress with temperature. Work hardening parameters discussed in terms of dislocation theory that has been developed mainly on the basis of data on Al and Cu. 42 ref. (Q23a, Q2, 2-63; Ni, 14-61)

667-Q.* Charpy Brittle-Fracture Transitions by the Lateral Expansion Energy Relationship. George M. Orner. *Welding Journal,* v. 37, May 1958, p. 201s-205s.

Brittle fracture transition temperature corresponding to a discontinuity in fracture versus lateral expansion relation correlates with low-low transition temperature provided effect of adiabatic temperature rise is taken into consideration.
(Q6, Q23r, Q26s, 2-61; AY)

668-Q.* A Unique Machine for Large Scale Fatigue Testing. H. V. Cordiano. Paper from "Symposium on Large Fatigue Testing Machines and Their Results," ASTM, STP no. 216, 1958, p. 3-20.

Machine of vibratory type; disturbing force consists of an alternating couple developed by two sets of rotating eccentric disks on parallel shafts rotating in the same direction 180° out of phase. Absorber consists of weighted test specimen subjected to bending load. Results of fatigue tests on riveted and welded steel plate. 10 ref.

679-Q. Some Correlations Regarding the Mechanical Strength of Materials Obtained by Sintering of Powdered Metals. Pt. 3. Case When Powder Mixtures Contain Easily Fusible Components. B. Ia. Pines, A. F. Sirenko and N. I. Sukhinin. *Soviet Physics, Technical Physics,* v. 2, 1958, p. 1773-1779. (American Institute of Physics, Inc.)

The mechanical strength of single-phase pressings of the powder of a plastic metal (Cu) heated at a high temperature (1000° C.) decreases with increase of porosity over a wide range (0.40%), which is to be expected, considering the weakening of the cross section. At the same time the strength depends only on the final porosity (obtained after heating) and is independent of the initial porosity (dependent on compression). For a given final porosity a slight dependence of strength on the granular condition of the powder is observed. 4 ref.

683-Q.* (Russian.) **Metallurgical Study of the Influence of Predeformation at Different Temperatures on the Plastic Deformation of Aluminum Single Crystals.** L. I. Vasil'ev, Ch'ien Lin-chao and Yang Ta-yu. *Scientia Sinica,* v. 8, no. 1, 1958.

Metallographic and electron microscope study of the influence of preliminary stretching upon the relief of single crystals of pure Al and their subsequent elongation under different conditions of temperature. Preliminary elongation at low temperature causes a number of peculiarities of the structure to appear in subsequent elongation at high temperature. The influence of high-temperature predeformation in subsequent low-temperature tests appears chiefly in the superposition of a superficial deformation relief.

(Q24, M26c; Al, 14-61)

684-Q.* **New Alloy Steels Beat Process Bugaboos.** R. B. Norden. *Chemical Engineering,* May 19, 1958, p. 180-184.

Four very-low-carbon grades of wrought stainless steel are commercially available today: an 18-8 Cr-Ni steel (304L); 18-8 with about 2.58% Mo (316L); 18-8 with about 3.5% Mo (317L); and a high-Mn, low-Ni grade (204L). Specific purpose in development was to provide an austenitic stainless steel of superior resistance to intergranular corrosion. (Q-general, R2h; SS)

685-Q.* **Surface Structure of Slip Bands on Copper Fatigued at 293°, 90°, 20°, and 4.2° K.** D. Hull. *Institute of Metals, Journal,* v. 86, May 1958, p. 425-430.

Slip bands produced during fatigue deformation of high-purity Cu at temperatures between 293 and 4.2° K. studied with optical and electron microscopes. Replicas of the surface reveal the changes in contour within individual slip bands, above and below the surface. Extrusions and intrusions are formed in the slip bands at all temperatures of testing, and their formation is not suppressed at 4.2° K. 17 ref. (Q24a, Q7; Cu-a)

686-Q.* **Some Effects of Mechanical Working on the Deformation of Nonmetallic Inclusions.** F. B. Pickering. *Iron and Steel Institute, Journal,* v. 189, June 1958, p. 148-159.

Effect of temperature and extent of hot working upon deformation characteristics. At high temperatures siliceous inclusions deform and elongate prior to fracturing, but at lower temperatures they fracture with little or no deformation. Concluded that fracture of the inclusions is necessary to disperse the larger detrimental inclusions into smaller, less harmful particles. 5 ref. (Q24; ST, 9-69)

687-Q.* **Uncommon Metals Ready to Solve Difficult Problems.** J. P. Denny and L. F. Kendall. Digest of paper presented before Design Engineering Conference, Chicago, Apr. 1958. *Metal Progress,* v. 73, June 1958, p. 136, 138, 140, 142, 144, 146, 148.

Zirconium, hafnium, vanadium, columbium, tantalum, chromium and rhenium, now available at least in development quantities, are finding applications formerly unknown. Properties and prices. (Q-general, P-general; SGA-g, SGA-h, Cr, Cb, Ta, V, Zr, Hf)

688-Q. Regularities in Creep and Hot-Fatigue Data. Pt. 2. K. F. A. Walles and A. Graham. *National Gas Turbine Establishment,* Report no. R.190, Dec. 1956, 144 p.

Creep-rupture, creep rate and hot fatigue data for 44 materials considered theoretically.
(Q3, Q7, 2-62)

689-Q.* **The Mechanical and Engineering Properties of Commercially Available Titanium Alloys.** H. V. Kinsey. *North Atlantic Treaty Organization Advisory Group for Aeronautical Research and Development,* Report 100, 1957, 15 p.

Lists the Ti alloys produced on a commercial basis up to early 1957; nominal chemical compositions and manufacturer's designations; physical, mechanical and engineering properties. Those properties required by the aeronautical design engineer that are not available.
(Q-general; Ti-b)

690-Q.* Statistical Aspect in Accelerating Creep and Creep Fracture of OFHC Copper. Takeo Yokobori. *Physical Society of Japan, Journal,* v. 13, Mar. 1958, p. 305-312.

A large number of creep-rupture tests on OFHC Cu wire have been carried out at stress levels of 24.0 to 25.0 kg. per sq. mm. and temperatures of 8 to 40° C. The F-test was made for the differences in variance between time for initiation of accelerating creep and time for rupture measured from the initiation of accelerating creep, and the regression analysis between these times was carried out. 10 ref. (Q3, S12; Cu-a)

691-Q.* Annealed Metals Under Alternating Plastic Strain. W. A. Wood and R. L. Segall. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 180-188.

Annealed Cu, Ni, Al and alpha brass were subjected to cycles of small alternating torsion in which the amplitude of plastic strain was held constant; proof stresses required to impose the successive reversals of strain were measured. Variations in this proof stress, which shows how the metal strain-hardens at each amplitude, are correlated with structural changes shown by X-ray diffraction and metallographic examination. 19 ref. (Q7, Q1; Cu, Al, Ni)

692-Q. Fatigue and Ultimate Tensile Strengths of Metals Between 4.2 and 293° K. R. D. McCammon and H. M. Rosenberg. *Royal Society, Proceedings,* v. 242, Oct. 29, 1957, p. 203-211.

Fatigue of Cu, Ag, Au, Al, Mg, Zn and Fe has been investigated at 4.2, 20, 90 and 293° K. Except for Zn and Fe, which exhibit brittle fracture at low temperatures, fatigue characteristics improve considerably as the temperature is reduced. Ultimate tensile strength was measured at each temperature and showed a marked correlation to the increase in fatigue strength at low temperatures. Results with reference to current ideas on the mechanism of fatigue. 10 ref. (Q7, Q27a, 2-63; Ag, Al, Au, Cu, Fe, Mg, Zn)

693-Q.* On the Ductility of Polycrystalline Beryllium. J. F. W. Bishop. *United Kingdom Atomic Energy Authority,* IGR-Tn/S-791, Feb. 1958, 12 p.

The elongation to failure of single and polycrystalline specimens of Be is markedly correlated with crystal and grain orientations, varying from virtually zero to tens of percent. Anomalous ductility of the metal under time independent straining conditions can be rationalized on the basis of the great resistance to compressive deformation normal to the basal plane offered by the crystals at temperatures below 700° C. Directional ductility can in principle be induced in the metal to meet specific requirements. 6 ref. (Q23p; Be)

694-Q. Room Temperature Deformation Process in Zirconium. E. J. Rapperport. Nuclear Metals, Inc. *U. S. Atomic Energy Commission,* NMI-1199, Feb. 24, 1958, 24 p. (Order from Office of Technical Services, Washington 25, D. C.) $.75.

Work performed on single crystals and on large-grained samples of relatively high purity. Iodide crystal-bar Zr was used, some samples being made from arc-melted stock, and some from the crystal bar as grown. Two methods of crystal production were employed. One was to maintain the samples at 840° C. in vacuo for eight to ten days; the other was to cycle the samples two or three times between 1200 and 840° C., remaining at the higher temperature for about 4 hr., and at the lower for five days. The only slip system observed was (1010) [1210] with a critical resolved shear stress for slip of about 0.65 kg. per sq. mm. in compression. The active twin planes were {1012}, {1121}, {1122}, and {1123}. 18 ref. (Q24; Zr, 14-61)

695-Q. Plastic Strain Absorption as a Criterion for High Temperature Design. C. R. Kennedy and D. A. Douglas. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2360, May, 1958, 25 p. (Order from Office of Technical Services, Washington 25, D. C.) $1.

Test apparatus is capable of mechanically cycling a specimen in tension and compression within set strain limits. Data confirm Coffin's theory that total plastic strain per cycle can be used to predict the number of cycles to failure. Evidence that Inconel strain weakens at the test temperature; grain size found to be the most important variable affecting the behavior of materials subjected to strain reversals. (Q23, 1-53, 2-59; Ni-b)

696-Q.* Fatigue and Ultrasonic Attenuation. Rohn Truell and Akira Hikata. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 63-70.

Attenuation as a function of the number of cycles in tension or in tension and compression. Results of these measurements in 2S, 24ST-4 and 75S Al. (Q7, 1-74)

697-Q.* Studies of Type 301 Stainless Steel Columns. Julien Dubuc, V. N. Krivobok and Georges Welter. Paper from "Metals", ASTM STP No. 196, p. 1-21.

Creep or cycling the applied load has no effect on the final stress-strain compression curve; however, the stress-strain relationship in the column after previous stressing and then relieving the stress to zero is entirely different from the original relationship. Beneficial effects of heat treatment at relatively low temperatures. 4 ref. (Q28k, 2-64; SS)

698-Q.* Effect of Forming on Mechanical Properties. J. L. Waisman and C. S. Yen. Paper from "Metals", ASTM STP No. 196, p. 33-44. (Also appears in "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 67-78.)

Effects of stretching and bending on the static and fatigue strengths of sheet metals were determined experimentally on several aluminum alloys, commercial pure titanium and Type 302 stainless steel. These effects can be explained or predicted by considering the effect of three factors; strain hardening, micro-residual stress, and macro-residual stress.

(Q7a, Q27a, 3-68; Al, Ti, SS, 4-53)

699-Q.* Axial Stress Fatigue, Creep, and Rupture Properties of Unnotched and Notched Specimens of Heat-Resistant Alloys. F. H. Vitrovec and B. J. Lazan. Paper from "Metals", ASTM STP No. 196, p. 45-62.

Fatigue, rupture and creep data at various temperatures obtained under various combinations of mean and alternating stress for Stellite 31, Waspalloy (6.3% Mo), Inconel X-550, Timken 16-25-6, Lapelloy, and stainless steel Type 403. Data are presented as stress range diagrams to show effect on the fatigue and creep properties of specimen notch, temperature, ratio of alternating-to-mean stress, and stress magnitude. 11 ref.

(Q7, Q3m; SGA-h, SS, Co, Ni)

700-Q.* Determination of Young's Modulus Under Conditions of Relaxation. Raymond W. Fenn. Paper from "Metals", ASTM STP No. 196, p. 63-76.

Equipment for determination of Young's modulus in Mg alloys; methods for obtaining improved axial alignment. Statistical analyses show effect of five methods of gripping specimens on the apparent Young's modulus and the degree of misalignment. 4 ref. (Q21a, 1-53; Mg)

701-Q.* Effect of a Number of Variables on the Fatigue Properties of High-Strength Steels. G. Sachs, B. B. Muvdi and E. P. Klier. Paper from "Metals", ASTM STP No. 196, p. 77-93.

Fatigue tests were performed on specimens machined from 3 to 4½-in. round or square steel sections subsequently heat treated. Steels were aircraft quality 4340, 93B40, V-Mod. 4330, Hy-Tuf and Super Hy-Tuf. Variables studied were specimen position in the steel section, as-processed section size, strength level or tempering temperature, stress concentration, and fibering or directionality. 10 ref. (Q7; AY, SGB-a)

702-Q.* The Effect of Temperature, Frequency, and Grain Size on the Fatigue Properties of High-Purity Aluminum. N. H. G. Daniels and John E. Dorn. Paper from "Metals", ASTM STP No. 196, p. 94-110.

At room temperature the fatigue strength of high-purity Al approaches a lower limiting value in accord with the usual observations on nonferrous metals. At 250° C. fatigue strength continues to decrease abruptly with increasing cycles of stress without exhibiting any trend toward reaching a limiting value even at 10^7 cycles; finer grain-sized specimens exhibit higher fatigue strength at 250° C. 16 ref. (Q7a, 2-61, 2-59; Al-a)

703-Q.* Determination of Fatigue-Crack Initiation and Propagation in a Magnesium Alloy. R. B. Clapper and J. A. Watz. Paper from "Metals", ASTM STP No. 196, p. 111-122.

Rotating-beam fatigue tests were carried out on AZ63A-T4 Mg alloy to determine the initiation and propagation characteristics of a fatigue crack. An electric resistance method for measuring cracks nondestructively was developed. No relationship was apparent between life before crack initiation and life after initiation. 10 ref. (Q7, Q26; Mg)

704-Q.* Uni-Directional Axial Tension Tests of Beryllium Copper and Several Precipitation Hardening Corrosion-Resistant Steels. M. H. Weisman, J. Melill and T. Matsuda. Paper from "Metals", ASTM STP No. 196, p. 123-142. (Also appears in "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 47-66.

Results of notched tensile tests and smooth and V-notched fatigue tests are reported for beryllium copper, AM350 corrosion-resistant steel, and A-286 heat and corrosion resistant steel, and for open-hole notched specimens of 17-7PH corrosion-resistant steel. Cyclic loading tests also are reported for dimpled and riveted sheet specimens of AM350 steel which simulate typical single-lap riveted aircraft joints. Other tests are reported for 17-7PH steel specimens containing unloaded rivet-filled holes. (Q7; Cu, *Be,* SS)

705-Q.* The Properties of Beryllium Copper Strip as Affected by Cold Rolling and Heat Treatment. John T. Richards and Ellsworth M. Smith. Paper from "Metals", ASTM STP No. 196, p. 143-156.

Tension and hardness tests to determine the influence of cold rolling and precipitation hardening; also effect of Be content, strip thickness and structure. New age-hardening treatments for maximum strength and hardness are proposed. 11 ref.

(Q27a, Q29n, 2-64, 3-68, J27; Cu-b, *Be*)

706-Q. Full Scale Wing Fatigue Testing. A. R. Vollmecke. Paper from "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 1-9.

Tests currently being run at Convair. (Q7k, T24a)

707-Q.* Riveted-Joints Fatigue Strength. C. R. Smith and G. D. Lindeneau. Paper from "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 10-28.

Fatigue strength of riveted joints is affected by following variables: residual stress due to riveting; stress due to load per rivet; bending stress caused by eccentric loading; stress due to load passing onto other rivets. (Q7; 7-53)

708-Q.* The Rehabilitation of Fatigue-Weary Structure. J. P. Butler. Paper from "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 29-46.

Initial fatigue cracks in Al aircraft structures are of local nature in typical structural joints studied. Fatigue cracks at fasteners were reliably discovered by visual inspection with only small-power magnification. Careful inspection practices, the removal of 0.030 in. of material in the hole beyond the last visual traces of the fatigue crack effectively removes fatigue damaged material and provides an extended service life for the joints. 9 ref. (Q7, T24a; Al)

709-Q.* Fatigue Testing of Airframe Structural Components. H. W. Foster. Paper from "Fatigue of Aircraft Structures", ASTM STP No. 203, p. 79-100.

Typical airframe component tests illustrated and discussed, including tests of primary wing surface structure, landing gear, and secondary and equipment structure subjected to very high cycle loadings. 9 ref.

(Q7, T24a, 1-54)

710-Q. Summary of Strength Limitation Phenomena. George Sachs. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 11-35.

Effect of carbon content, hydrogen and oxygen on tensile strength, yield strength and ductility of constructional steel. 13 ref.

(Q27a, Q23p, Q23b, 2-60; ST, SGB-s)

711-Q. Dislocations and Strength. P. B. Hirsch. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 36-70.

Current theories on plastic deformation. Yield stress of a metal is determined by two factors; the elastic interactions between the dislocations which must be overcome before the dislocations move, and the "frictional force" on the dislocations on account of the presence of jogs, or because of the difficulty of cutting through other dislocations. 19 ref. (Q24, M26b)

712-Q. Effects of Grain Size, Solid Solution and Other Metallurgical Factors on Strength. Earl R. Parker. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 71-83.

To harden a metal it is necessary to introduce many barriers which are either impermeable to dislocations or through which dislocations can pass only at high stress levels. There are several very effective barriers, namely grain boundaries, clusters of solute atoms, precipitated particles and piles of tangled dislocations. Effect of each of these. 8 ref.

(Q27a, Q29n, M26b, N-general)

713-Q. Dependence of Strength on Loading Speed and Loading Time. D. S. Wood. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 103-124.

The effect of rate and time of loading on the conventional stress-strain characteristics; influence of wave propagation phenomena. 7 ref. (Q25n)

714-Q. Strength Limitations Under Repeated Load. Elio D'Appolonia. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 125-142.

Tests on rotating-beam specimens of 75A Ti alloy at high stress levels show a pseudo-elastic behavior for a portion of their fatigue life. Stress-strain relation during cyclic loading is the same as the linear portion of the stress-strain curve obtained by static loading. Continuous time records of the mid-span deflection and the torque necessary to turn a rotating-beam fatigue specimen at constant speed were used to study damage produced by plastic deformations. 8 ref. (Q7, Q25n; Ti)

715-Q. Effect of Section Size on Fracturing. J. D. Lubahan. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 143-161.

Size effect in mild steel has to do with the mode of crack propagation. In larger specimens, sudden cleavage fracture sets in after a smaller amount of gradual tearing than in smaller specimens. There is a size effect on strength and ductility, in addition to the effect on mode of crack propagation, in certain heat treated steels and high-strength Al alloys. The size effect is more pronounced for sharper notches or for harder metal. 11 ref. (Q26, 3-73; CN)

716-Q. Effects of Stress Concentrations and Residual Stresses. Oscar Hoffman. Paper from "Proceedings of the Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 162-178.

Problems that arise in connection with the employment of large forgings of high-strength alloys in aircraft structures and specifically in aircraft landing gears. Behavior of a structural alloy in an area of stress concentration depends upon its ductility (i.e., on the amount of plastic flow that can develop before fracture and modify the stress distribution in the sense of reducing stress peaks). (Q25; SGB-a)

717-Q. Effects of Hydrogen on High-Strength Alloys. Volker Weiss. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 179-203.

General effects of hydrogen in steels and Ti alloys originating from both cell action and processing in hydrogen-containing environments. Effects of strain rate on hydrogen embrittlement were studied on 4340 steel. The notch-tensile test, which was earlier proven to be highly ductility-sensitive, was used. Similar effects were observed on Cu-plated low-alloy steels having strength levels below 200,000 psi. and on Ti. 9 ref.

(Q27, Q26s; AY, SGB-a, *H*)

718-Q. Super-High Strength Steels for Aircraft Applications. I. W. Sands. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 204-232.

Four steels of the ultra high-strength type used in current production airplanes: standard 4340, modified 4330 (Bendix-Republic AMS 6427) Hy-Tuf, another modification of the 4330 type originally designated TM-2 but now rechristened HS-220 (Timken). 7 ref.

(Q27a, T24a, 17-57; AY, SGB-a)

719-Q. High Impact Strength Steels for Low-Temperature Service. A. Hur-

lich. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 233-257.

Requirements of steels for ordnance application. Boron-treated alloy steels and use of rare earth additions to steel to improve ductility and low-temperature toughness at high strength levels.

(Q6n, Q23p, 2-63, T2, 17-67; AY)

720-Q. Strength Limitations of High Strength Steels at Moderately Elevated Temperatures. W. F. Brown. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 258-288.

Creep and high-temperature behavior of SAE 4340 (A), SAE 4340 (B), 17-22 A (S), AMS 5616, 17-4 PH, AISI 410, Inconel X, and A286. Optimum heat treatments. 23 ref. (Q3, 2-62, J-general; AY, SS, Ni-b)

721-Q. Onset of Fast Crack Propagation in High Strength Steel and Aluminum Alloys. G. R. Irwin. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 289-305.

Various amounts of fracture extension force may be applied to a test specimen containing a crack and the response measured in terms of time rate of fracture extension. It is generally true that this extension rate changes from slow to fast for relatively small changes of the crack extension force. Therefore the critical values, thus determined, have a significance relative to resistance to fracturing similar to that of yield strength as a measure of resistance to yielding. 5 ref. (Q26q; ST, Al, SGB-a)

722-Q. Strength Limitations for Titanium Alloys. S. V. Arnold. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 306-352.

Relation of strength-to-ductility and of strength-to-toughness. Of the binary systems, Ti-Mn, Ti-Mo and Ti-V show the most promise; of the ternary systems, Ti-Al-Mn, Ti-Al-V, Ti-Mn-V and Ti-Mo-V show superiority. Alloys containing interstitial elements are inferior.

(Q27a, Q23; Ti-b)

723-Q. Aluminum Alloys. E. H. Dix. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 353-379.

Four classifications of Al alloys discussed: high-strength wrought alloys; some new permanent mold casting alloys having improved combinations of strength and ductility; alloys and products for elevated-temperature service; wrought non-heat-treatable alloys for welded structures. (Q27; Al)

724-Q. High Strength Magnesium Alloys. J. C. McDonald. Paper from "Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals", U. S. Office of Technical Services, PB 131280 and PB 131281, p. 380-398.

Factors involved in alloy development; principles of strengthening in Mg alloys; classes of alloys; extrusion and forging alloys; sheet alloys; casting alloys; alloys with maximum properties at elevated temperatures; design considerations. (Q27; Mg, SGB-a)

725-Q. On the Change of Electrical Resistivity in Elementary Dislocation Generation. E. D. Shchukin, V. N. Rozhanskii and Iu. V. Goriunov. *Soviet Physics "Doklady"*, v. 2, 1957, p. 420-422. (Translation by American Institute of Physics Inc.)

Experiments performed on single crystals of Cd (0.75 mm. diameter) and of Zn (0.5 mm. diameters), 15-20 mm. long, at room temperature with the initial angle 30° between the hexagonal axis and the direction of stretching. Stretching occurred under a constant load to 3-5% elongation at an average rate of (0.03-0.6) 10^{-4} cm. per sec.; 1% stretching was ordinarily observed at intervals of 1 to 2 hr.

(Q24, P15g; Cd, Zn, 14-61)

726-Q.* (Japanese.) **Effect of Manganese and Chromium on the Characteristics of Aluminum-Magnesium (3-5%) Alloys. Pt. 3.** Rihei Kawachi. *Light Metals (Tokyo)*, v. 8, Mar. 1958, p. 24-33.

Effect of Mn, Cr, Fe, Si, Cu, Zn and Ti on tensile properties and corrosion resistivity of sample (0.5 mm. thick) immersed in sea water with or without stress for up to 12 months shows Mn, Cr, Fe or Cu decrease sensitivity. Effect of Mg, Si, Cu, Zn or Ti on hot working temperature or the preheating characteristics of the ingot is not remarkable.

(Q27, R-general, 2-60; Al, *Mg*)

727-Q. (Russian.) **Relation Between Macro and Microhardness of Metals.** V. D. Lisitsyn. *Zavodskaya Laboratoriya,* v. 24, Apr. 1958, p. 467-470.

Study of macro and microhardness of metals in original and deformed state with help of Vol'pert microtester. 10 ref. (Q29)

728-Q. (Russian.) **Application of Microhardness Test Methods to Determine Strength of Structural Steel After Riveting and Steels Hardened by Aging.** K. M. Pogodina-Alekseeva and E. E. Krotkova. *Zavodskaya Laboratoriya,* v. 24, Apr. 1958, p. 470-473.

4 ref. (Q29q; ST, 2-64, 8-57)

4 ref. (Q21a, 1-54)

730-Q.* (Spanish.) **Brittleness in Heat Treated Type F. 123. I.H.A. Nickel-Chromium Steel.** Justo Ferrer Flotats. *Instituto del Hierro y del Acero,* v. 11, Jan-Mar. 1958, p. 39-57.

Extraordinary brittleness in series of camshafts led to a study of samples of same type of steel from other sources. Desired degree of toughness can be obtained through proper temperature control during tempering and control of cooling speed. 28 ref. (Q26s, 2-14; AY)

731-Q.* **Effect of Shot-Peening on Fatigue Strength.** R. P. Felgar. *American Society of Mechanical Engineers,* Paper no. 58-SA-46, 1958, 9 p.

Shot-peening introduces three effects: cold-working, residual stress, and stress concentrations. Relation of these effects to fatigue strength. Influence of the induced residual stress on the fatigue strength can be predicted theoretically. 19 ref. (Q7, G23n)

732-Q.* **Distribution of Fatigue Failures in Flat Hardened Steel Test Bars.** W. S. Hyler, L. P. Tarasov and R. J. Favor. *ASTM, Preprint no. 69,* 1958, 11 p.

Locations of fatigue nuclei in flat hardened steel bars tested in cantilever bending were analyzed with respect to their distributions in the three principal directions. Mean longitudinal fracture location was near the maximum stress section; the location was relatively insensitive to grinding or tumbling conditions, relative stress level (ratio of applied stress to fatigue limit), and whether failure nucleated at or below the surface. 8 ref.

(Q7, G18, L10d; ST)

733-Q.* **Torsional Fatigue Properties of Small Diameter High Carbon Steel Wire.** Harry C. Burnett. *ASTM, Preprint no. 70,* 1958, 11 p.

In general, there was no direct correlation between these properties and tensile strength of the wire. Comparison of a commercial cold drawn wire with wire from a vacuum-melted heat showed that the torsional fatigue life of cold drawn wire is decreased by the presence of inclusions. Oil tempered wire stressed in torsion is less susceptible to the initiation of longitudinal shear cracks than cold drawn music wire. Shot peening greatly increased the fatigue life of springs coiled from all three types of wire. 5 ref. (Q7h; CN-r, 4-61)

734-Q.* **Effects of Grinding Direction and of Abrasive Tumbling on the Fatigue Limit of Hardened Steel.** L. P. Tarasov, W. S. Hyler and H. R. Letner. *ASTM, Preprint no. 71,* 1958, 11 p.

Although it has generally been assumed that parts ground transversely to the direction of applied stress would have a lower fatigue limit than those ground parallel to it, no such effect was found for two different grinding conditions. Abrasive tumbling was found to raise the fatigue limit to a moderate extent, whether the surface had been previously stressed in tension or in compression by grinding. The tumbled surfaces were stressed very highly in compression and the failures nucleated below the surface. 5 ref. (Q7a, G18, L10d; ST)

735-Q.* **Evaluation of a Single-Shear Specimen for Sheet Material.** W. W. Breindel, C. L. Seale and R. L. Carlson. *ASTM, Preprint, no. 80,* 1958, 7 p.

Single shear-type specimen which provides values of ultimate shear strength evaluated by tests on annealed and cold rolled Type 304 stainless steel, 2024-T3 Al alloy, and annealed 6Al-4V Ti alloy. 5 ref. (Q2, 1-60; SS, Al-b, Ti-b, 4-53)

736-Q. **Elastic-Plastic Analysis of Scabbing in Materials.** Sudhir Kumar and Norman Davids. *Franklin Institute, Journal,* v. 265, May 1958, p. 371-383.

"Scab" refers to the pieces of various shapes and sizes which fracture from a solid material when a sudden pressure of high intensity,

such as an explosion, is applied. A bar of 14S-T4 Al alloy is investigated. 17 ref. (Q26, Al)

737-Q.* Hot Strength Properties of Filamentary Nickel Alloys. Bernard Wolk. *IRE Transactions on Electron Devices,* v. ED-5, no. 2, Apr. 1958, p. 58-65.

Several Ni and Co base alloys (with such elements as Al, W, Cr) were tested for hot strength because of their possibilities as efficient primary electron emitters (when coated with alkaline earth oxides). Diameters of filaments were all 0.001 in. or less. (Q27a, 2-62; Ni-b, Co-b, 4-61)

738-Q. Effects of Radiation Environment on Structural Metals. Alvin Boltax. *Electrical Manufacturing,* v. 61, June 1958, p. 125-133.

739-Q. Evaluation of Niobium Alloys as High-Temperature Materials. W. S. Hazelton. *Machine Design,* v. 30, May 15, 1958, p. 150-152.

Properties of columbium compared to those of established alloys to evaluate the metal as a structural material for high-temperature use. (Q-general, 17-57; Cb-b, SGA-h)

740-Q. Thermal Stresses in Design. Pt. 1. Appraisal of Brittle Materials. S. S. Manson. *Machine Design,* v. 30, June 12, 1958, p. 114-120.

Failure criteria, thermal shock in flat plates, thermal shock parameters. 7 ref. (Q10a, Q26s)

741-Q. Manufacture of Pressure Vessels. H. Harris. *Nuclear Power,* v. 3, May 1958, p. 210-212.

Problems of brittle fracture. (Q26s, T26q; ST)

742-Q.* Annealing in Slip Bands in Copper Fatigued at 90° K. D. Hull. *Philosophical Magazine,* v. 3, May 1958, p. 513-518.

Number of slip bands formed during fatigue of O.F.H.C. copper compared at 90° K. and 293° K. For equivalent stresses to cause failure more slip bands are formed at 90° K. than at 293° K. The number of slip bands formed increases with the length of the test. 6 ref. (Q24a, Q7; Cu)

743-Q.* The Influence of Vacancies Upon the Internal Friction of Polycrystalline Copper. R. S. Barnes, N. H. Hancock and E. C. H. Silk. *Philosophical Magazine,* v. 3, May 1958, p. 519-526.

Neutron irradiation, gamma irradiation and quenching all change the internal friction of pure polycrystalline rods of Cu. Only if the rods are initially given an anneal near the melting point for many hours do these three treatments give consistent and similar results, and then the logarithmic decrement is reduced. 16 ref. (Q22, 2-67; Cu-a)

744-Q.* The Effects of Neutron Irradiation Upon the Internal Friction of Copper Single Crystals at Liquid Nitrogen Temperatures. R. S. Barnes and N. H. Hancock. *Philosophical Magazine,* v. 3, May 1958, p. 527-530.

The internal friction of Cu single crystals remains unaffected by a short neutron bombardment at −195° C. if no warning is allowed before measurement. Successive pulse anneals produce no marked change until 23° C. is reached, when the internal friction is greatly reduced. 6 ref.

(Q22, 2-67, 2-63; Cu-a, 14-61)

745-Q.* New Coefficients Predict Wear of Metal Parts. Ernest Rabinowicz. *Product Engineering,* v. 29, June 23, 1958, p. 71-73.

Effects of galling, poor oil, dust, surface cracks. Magnitude of wear can be predicted with simple general equations. Sliding may give one or a combination of four forms of wear: adhesive, abrasive, corrosive and surface fatigue. Wear coefficients can be read from a conversion chart when friction coefficient and velocity of sliding surfaces are known. Equations apply to adhesive and abrasive wear. No simple expression for corrosive wear has appeared and no clear-cut wear rate exists for surface fatigue. (Q9)

746-Q.* Analysis of Elasto-Plastic Behavior of Metals by Means of Photoelastic Coating Method. Kozo Kawata. *Scientific Research Institute, Journal,* v. 52, Mar. 1958, p. 17-40.

Thin films of photo-elastic material bonded to metal surfaces may provide a means of measuring the elasto-plastic strain distribution along the surface of metal. A new photo-elastic material, epoxy-polysulphide copolymer (epoxy rubber) is studied for use at room temperature. This polymer has suitable properties, such as large maximum elongation, low Young's modulus, high strain-optical sensitivity and high bonding strength to metal surfaces. 7 ref. (Q21, 1-54)

747-Q. Some Properties of Neptunium Metal. *Soviet Journal of Atomic*

Energy, v. 3, 1957, p. 956-957. (Translation by Consultants Bureau, Inc.)

The ultimate tensile strength of neptunium, determined from the stress-strain curve and the empirical relationship between hardness and tensile strength lines within the limits of 124-138 kg. per sq. mm. (Q27, Q29; Np)

748-Q. Relaxation of Nonoriented Microstresses. Pt. 2. B. M. Rovinskii and V. G. Liutsau. *Soviet Physics, Technical Physics*, v. 2, 1957, p. 2005-2008. (Translation by American Institute of Physics, Inc.)

Curves obtained for the recovery of X-ray diffraction line breadth of plastically deformed pure metals (Al, Cu) at room temperature. Study shows that changes in the breadth of the lines with time are due basically to the relaxation of nonoriented microstresses. 8 ref. (Q24, Q25; Al-a, Cu-a)

749-Q.* Variables Affecting the Thermal Stability of Three Titanium Alloys. F. R. Schwartzberg, D. N. Williams and R. I. Jaffee. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 3-13.

Effects of variations in stress, strain, time and temperature during thermal exposure on the tendency toward thermal instability in Ti-2Mo-2Cr-2Fe, Ti-6Al-4V, and Ti-4Al-4Mn alloys. Alloys were vacuum annealed and given a stabilizing heat treatment. None showed evidence of instability over a wide range of exposure conditions. Tests showed that a contaminated surface skin could lead to some embrittlement in Ti-2Mo-2Cr-2Fe but not in Ti-6Al-4V or Ti-4Al-4Mn. (Q10a, 2-62; Ti-b)

750-Q.* The Effect of Temperature on the Uniform Elongation of Titanium Alloys. F. C. Holden, H. R. Ogden and R. I. Jaffee. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 14-31.

Limits of uniform elongation were measured for typical alpha, alpha-beta and beta alloys in three microstructural conditions over a temperature range from −75 to 300° C. Highest uniform elongation was obtained for commercial Ti (alpha); low for the beta-quenched 7.5 Cr, 7.5 Mo alloy. Presence of massive alpha in the alpha-beta alloys increases their uniform elongation. Dependence on temperature is marked, particularly in the two-phase alloys. (Q27a, 2-61; Ti-b)

751-Q.* The Effect of Composition and Annealing Treatment on the Thermal Stability of Chromium-Molybdenum Alloys of Titanium. H. R. Ogden, F. C. Holden and R. I. Jaffee. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 32-47.

Annealing treatments originating in the beta field produce a stable condition more rapidly than in the alpha-beta field. Instability in a 5% Cr alloy is related to the formation of eutectoid products. Substitution of Mo for half of the Cr retards the eutectoid reaction resulting in a more stable condition. Small additions of oxygen to the Cr-Mo alloys do not appear to affect stability. (Q10a, 2-60, 2-64; Ti-b, *Cr, Mo*)

752-Q.* Elevated-Temperature Properties of the 6 Per Cent Aluminum, 4 Per Cent Vanadium Titanium Alloys. W. M. Parris, R. G. Sherman and H. D. Kessler. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 48-64.

Short-time tensile data at temperatures to 1000° F. Notched and unnotched stress-rupture data at 750, 850 and 950° F. for a mill-annealed condition and a high-strength heat treated condition. Creep test results including design curves showing 0.1, 0.2, 0.5, 1.0 and 5.0% creep at 650, 750 and 850° F. to 1000 hr. The 6 Al, 4 V alloy is metallurgically stable under stress to 950° F. and has good creep resistance to at least 850° F. (Q27a, Q3m, 2-62; Ti-b)

753-Q.* Development of Titanium Base Alloys for Elevated Temperature Applications. F. A. Crossley, W. F. Carew and H. D. Kessler. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 65-112.

Tension, creep-rupture and stability test results. Survey of hot tensile properties of binary alloys indicated Al to be the best metallic strengthener on a weight per cent basis. Creep-rupture tests on 33 ternary alloys. Effect of additions of carbon, nitrogen and oxygen on creep-rupture properties. The most creep resistant alloy developed having good tensile ductility and stability is the 7 Al, 3 Mo alloy. 22 ref. (Q27a, Q3m, 2-62; Ti-b)

754-Q.* The Effects of Carbon and Nitrogen Contamination on the Notch Tensile Properties of Titanium. E. P. Klier and N. J. Feola. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 113-123.

Notch sensitivity of unalloyed Ti as determined in the notch tension test differs from that measured in the Charpy V-notch impact test. The ductile-brittle transition in the notch tension test occurs at a much lower testing temperature than for the impact test. At a testing temperature of −100° F. neither 0.26% carbon nor 0.23% nitrogen leads to embrittlement in the notch tensile test. 9 ref. (Q23s, Q6, 2-63; Ti)

755-Q.* A Micro Notched-Bar Impact Test for Titanium Alloys. F. C. Holden, H. R. Ogden and R. I. Jaffee. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 124-129.

Behavior of the micro-impact test compared with that of the V-notch Charpy test over a temperature range from −196 to 300° C. for AISI 8745 steel, austenitized, 2017-T4 (17S) aluminum and 70-30 brass, both in the annealed condition, commercial Ti, and two Ti alloys (7 Mn and 4 Mn, 4 Al).

(Q6, 1-54; Ti, AY, Al, Cu-n)

756-Q.* The Measurement of Elastic Modulus of Titanium Alloys. W. H. Graft and W. Rostoker. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 130-144.

Fundamentals of dynamic test methods; use of an electrostatic dynamic plastic modulus device. 6 ref. (Q21, 1-54; Ti-b)

757-Q.* Unalloyed Titanium Is Improving. H. H. Barry and L. Schapiro. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 161-163.

Histogram of specification properties of yield strength, ultimate strength and elongation for 1000 consecutive sheets at Douglas Aircraft. (Q27a; Ti, 4-53)

758-Q.* Properties and Fabrication Characteristics of Wrought Titanium Products. Leston B. Stark. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 170-182.

Mechanical property data and fabrication limits for Ti alloy sheet and extrusions; comments on forgings and their fabrication limits.

(Q-general, Q23q; Ti, 4-51, 4-53, 4-58)

759-Q.* Development of Standardized Specimen Preparation and Testing Techniques for Unalloyed Titanium Sheet. R. L. Folkman and M. Schussler. Paper from "Symposium on Titanium", ASTM STP No. 204, p. 183-196.

Variables in specimen preparation and testing techniques, and their effects on mechanical properties. Variables included melting (furnace pressure, atmosphere, electrode type and ingot size); rolling (sheet bar conditioning, hot rolling temperature); heat-treating (annealing temperatures and times); finishing (amount of surface removal by pickling); testing (strain rate and sample orientation).

(Q-general, 1-60; Ti, 4-53)

760-Q.* (Russian.) **Peak of Internal Friction in High Chromium-Nickel Steel Associated With Hydrogen Diffusion Is Caused by Stresses.** Kun Chin-Pin and Ke Tin-Sui. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 82-90.

Preparation of sample, method of testing, and effect of hydrogenation and of de-hydrogenation, effect of various temperatures, measurement of energy of activation and evaluation of results.

7 ref. (Q22, 3-66; SS, *H*)

761-Q.* (Russian.) **Investigation of Annealed Steel by Internal Friction.** I. N. Chernikova. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 102-105.

It was determined by torsional vibration that internal friction is related to various heat treatments of carbon steels of different carbon content. The frequency of specific vibration is about one Hertz. The peak at 200° may be characterized as a relaxation process attendant on the exit of carbon from solid solution of alpha iron during annealing. This peak rises with carbon content and lessens with temperature of annealing.

5 ref. (Q22, 2-64; CN)

762-Q.* (Russian.) **Elongation Caused by Bending.** Yu. E. Bondarev. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 106-109.

Characteristic stretching properties of metals control their tendency toward stiffening and determine under various conditions the extent which their volume is changed. Metals with greater uniform elongation may be bent through a greater angle than those with less uniform elongation. Bending is limited to a large extent by the inability of the metal to elongate. 5 ref. (Q5)

763-Q.* (Russian.) **Delayed Failure of Hardened Steels.** A. L. Nemchinskii. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 110-112.

Destructive extension of cracks begins when the tensile energy is suddenly released, grows into great force and is spent in expanding the crack. The resistance-time curve plotted from experimental results has two parts: inclined and horizontal. The inclined part seems to be determined by thermodynamics, and the horizontal by kinetics. 9 ref. (Q26; ST)

764-Q. (Russian.) **Influence of Ingot Weight on Quality of Structural Steels.** M. I. Kolosov, I. Ya. Aizenshtok, A. I. Komissarov, G. E. Mysina and M. S. Povolotskaya. *Stal'*, v. 18, May 1958, p. 411-414.

Lower mechanical properties of larger ingots (intercrystalline cracking). (Q-general; ST, 5-59, 9-72)

765-Q.* (Russian.) **Examination of Quality of Continuously Cast Transformer Steel.** N. M. Lopatyshskin, V. S. Rute and G. V. Gursky. *Stal'*, v. 18, May 1958, p. 417-425.

Plasticity of steel at high temperature; surface properties of castings; cooling methods; macrostructure and microstructure; nonmetallic inclusions and chemical heterogeneity; rolling and heat treatment; physical and mechanical properties of sheets.

(Q-general, D9q; ST, SGA-n)

766-Q.* (Russian.) **Influence of Aluminum Nitride on Quality of Cast Steel.** D. K. Butakov. *Stal'*, v. 18, May 1958, p. 457-463.

Behavior of aluminum nitride in steels; experimental technique; experiments in quartz chamber; experiments with air blowing. Effect of casting method, cooling speed, annealing at high temperature and forging. Unfavorable influence of aluminum nitride on mechanical properties of steel and preventive measures. 7 ref.

(Q-general, 2-60; ST, 5-60)

767-Q. Thermal Creep Design Criteria. Robert Goldin. *Aeronautical Engineering Review*, v. 16, Dec. 1957, p. 36-41.

7 ref. (Q3, T24, 17-51)

768-Q. Direct Stress Fatigue Tests on Redux-Bonded and Riveted Double Strap Joints in 10 S.W.G. Aluminum Alloy Sheet. S. Kelsey and J. B. Spooner. *Aeronautical Research Council*, C. P. no. 353, Dec. 1955, 48 p.

Bonded joints tended to fail by shear of the bond at the higher stress ranges and by tension of the sheet at the lower stress ranges. Riveted joints failed by tension across the first row of rivets in all cases, though tests on three-row riveted joints showed considerable improvement in endurance over those with two rows of rivets. Endurances were greater for bonded joints but with rather more scatter than for riveted joints.

784-Q.* Creep of Annealed Nickel, Copper, and Two Nickel-Copper Alloys. William D. Jenkins and Carl R. Johnson. *National Bureau of Standards, Journal of Research,* v. 60, Mar. 1958, p. 173-191.
Creep tests were made in tension under constant loads at temperatures of 300 to 900° F. on initially annealed specimens of Ni, Cu, 70-30 Ni-Cu alloy and 30-70 Ni-Cu. Tests at 1200° F. were also made on the Ni and the two alloys. Influence of rate of loading on the creep stress and of prior thermal mechanical history on the creep behavior of the alloys at several selected temperatures. 25 ref. (Q3, 2-64; Ni, Cu)

785-Q.* Preliminary Studies of Rolling-Contact Fatigue Life of High-Temperature Bearing Materials.

Thomas L. Carter. *National Advisory Committee for Aeronautics,* NACA RM E57K12, Apr. 1958, 27 p.

Investigation was made in the rolling contact fatigue spin rig. Vacuum melting improved fatigue life for AISI M-1 toolsteel, for both balls and races; further Al and Si additions, with or without Mo, to the basic SAE 52100 composition improved fatigue life with no apparent change in cleanliness. No correlation of rolling-contact fatigue life with cleanliness was obtained. 6 ref. (Q7a; AY, SGA-c)

786-Q.* Unloading Effects in the Plastic Properties of Copper Single Crystals. M. J. Makin. *Philosophical Magazine,* v. 3, Mar. 1958, p. 287-301.

Yield point phenomena occur on retesting Cu single crystals during interrupted tensile deformation. The effect is observed only during the linear and parabolic regions of the stress-strain curve and the size of the yield drop is directly proportional to the reduction in the stress on unloading. 9 ref.
(Q24c; Cu, 14-61)

787-Q.* The Temperature Dependence of Flow Stress in Copper Single Crystals. M. J. Makin. *Philosophical Magazine,* v. 3, Mar. 1958, p. 309-311.

Crystals were tested in a hard beam tensile machine at a strain rate of 6×10^{-5} per sec. Measurements were made between −195 and −159° C., −115, −78, −51, −30 + 84 and +196° C. Results confirm that the ratio of the flow stresses at two temperatures settles down after about 10% elongation to a constant value.

Six papers presented at Second Pacific Area National Meeting of the ASTM, Los Angeles, Sept. 16-21, 1956. Papers abstracted separately. (Q7, T24)

819-Q. (Book.) **Symposium on Titanium.** 208 p. 1958. American Society for Testing Materials, STP no. 204, 1916 Race St., Philadelphia 3, Pa. $4.75.

Fourteen papers from Second Pacific Area National Meeting ASTM, Los Angeles, Sept. 1956, on testing

techniques and effects of various heat treatments on the properties and characteristics of Ti and Ti alloys. Papers abstracted separately. (Q-general; Ti)

820-Q. (Book.) **Symposium on Large Fatigue Testing Machines and Their Results.** 151 p. 1958. American Society for Testing Materials, STP no. 216, 1916 Race St., Philadelphia 3, Pa. $4.25.

Papers abstracted separately. (Q7, 1-53)

821-Q. (Book.) **Proceedings of the 1955 Sagamore Research Conference on Strength Limitations of Metals.** Syracuse University Research Institute. 2 v., 399 p., Mar. 1956. U. S. Office of Technical Services, PB 131280, PB 131281, Washington 25, D. C. $10.50.

Twenty papers presented at Army Ordnance Corps. Research Conference held at Sagamore Lake, N. Y., Aug. 24-26, 1955. Papers abstracted separately. (Q27)

822-Q.* (German.) **Determination of Radiographic Value of Elastic Constant on Cold Rolled Armco Iron and Chromium-Molybdenum Steel.** Eckard Macherauch and Paul Müller. *Archiv für das Eisenhüttenwesen,* v. 29, Apr. 1958, p. 257-260.

Possible ways to determine elastic constant on the basis of elasticity theory. Two precise methods using radiographic measurements of lattice dimension. Tension experiments on Armco iron. Tension-pressure experiments on a Cr-Mo steel. (Q21, 1-54; Fe-a, AY, *Cr, Mo*)

822-Q. (Dutch.) **Material Problems Related to Brittle Fracture in Supertankers.** Georg Vedeler. *Lastechniek,* v. 24, May 1958, p. 76-84. 13 ref. (Q26s, T22, T26q; ST)

823-Q.* **Relation of Microhardness and Stresses in Copper Alloys.** P. J. LeThomas. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 41-48.

Microhardness of Cu or Cu alloys was measured in the proximity of cracks or break areas. When the test piece has been subjected to mechanical constraints, the microhardness reaches abnormal value in these regions. (Q29q, Q25; Cu)

824-Q.* **Ductile Iron—Alloyed and Normalized.** C. R. Isleib and R. E. Savage. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 75-83.

Mechanical properties were determined for four types of ductile iron: unalloyed, with Ni, Ni-Mo and Ni-Mo-V. Three conditions of heat treatment investigated: as cast; normalized; and normalized and tempered. 5 ref. (Q-general, 2-60, 2-64; CI-r)

825-Q.* **Transfer of Tungsten Carbide to Soft Metals During Single-Traverse and Reciprocating Sliding.** J. Golden and G. W. Rowe. *British Journal of Applied Physics,* v. 9, Mar. 1958, p. 120-121.

A small radioactive tungsten carbide hemisphere was slid slowly over Cu and steel plates. The tungsten carbide transferred to the plates was assessed by counting and autoradiography. On well-prepared Cu about 50×10^{-12} g. was transferred steadily to each mm. of track during a single traversal. This carbide was firmly embedded in the Cu, even after several traversals in each direction. Single traversals on mild and stainless steels also produced steady embedded wear, but with reciprocating traversals a considerable portion of the carbide was scattered loosely on the surface. (Q9; Cu, CN, SS, W, 6-69)

826-Q.* **A "Super-Elastic" Single Crystal Calibration Bar.** W. A. Rachinger. *British Journal of Applied Physics,* v. 9, June 1958, p. 250-252.

Elastic strains of up to 4% can be attained in a Cu-Al-Ni alloy in the form of a single crystal suitably heat treated. The high elasticity is due to a reversible martensite transformation induced by stressing. Methods of production and heat treatment of large crystals; details of mechanical properties. The alloy can be machined by conventional methods. Suggestions for development of other superelastic alloys. 5 ref. (Q21; Cu, Al, Ni, 14-61)

827-Q.* **Some Factors Affecting the Toughness of Mild Steel Castings.** Herbert H. Fairfield and John A. Ortiz. *Modern Castings,* v. 34, July 1958, p. 70-74.

Influence of sulphur, carbon and hydrogen on ductility; effects of various steelmaking operations. All reduction of area values quoted (used as the measure of toughness) are from separately cast test bars which have been normalized from 1650° F. and drawn for 8 hr. at 1250° F. 16 ref. (Q23p, 2-60; CN, 5-60)

828-Q.* Plastic Deformation of Nickel Single Crystals at Low Temperatures. Peter Haasen. *Philosophical Magazine,* v. 3, Apr. 1958, p. 384-418.

Single crystals of Ni (purities 99.98 and 99.4%) were deformed in tension at various temperatures between 4.2 and 300° K. Shear stress-shear strain relations, and reversible change of flow stress with temperature. The work-hardening parameters obtained are discussed in terms of dislocation theory developed mainly on the basis of data on Al and Cu. From the temperature dependence of the stress at the beginning of dynamical recovery the activation energy of cross-slip is estimated to be slightly lower than that of Cu, implying a somewhat higher stacking fault energy. 40 ref. (Q24, 263; Ni, 14-61)

829-Q.* The Cleavage of Metal Single Crystals. A. N. Stroh. *Philosophical Magazine,* v. 3, June 1958, p. 597-606.

A model of cleavage applicable to metals cleaving on the slip plane is developed in which a crack is initiated at the end of a low-angle tilt boundary terminating inside the crystal. The strength of the metal is determined by the difficulty of growth of the crack. Satisfactory agreement is obtained with the experimenfal results for Zn. 10 ref. (Q26n; 14-61)

830-Q. Ultra High Strength, Heat Resisting Steel. John C. Hamaker. *Society of Automotive Engineers, Preprint* S67, Mar. 1958, 12 p.

A 5% Cr air hardening steel appears to be the best presently available for either ultra-high strength applications at room or low temperatures, or for elevated temperature stability to 1000° F. In the 220-300,000-psi. tensile range, this steel provides significantly higher impact strength and ductility than low-alloy steels, and 20 to 35% higher fatigue strength than any air melted material previously reported. From 400 to 1000° F., its strength-to-weight ratio surpasses all materials, including heat treated Ti alloys. (Q-general; AY, SGA-h)

831-Q. Research and Development on Investigation of Galling and Friction Characteristics of Metallic Materials and Surface Treated Materials. E. W. Gaylord. Carnegie Institute of Technology. *U. S. Office of Technical Services,* PB 131347, July 1956, 63 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Tests of rubbing and friction characteristics disclosed that when Ti surfaces are to rub on Ti surfaces, both should be coated. When Ti surfaces are rubbed on other metals, only the Ti need be coated, if the other surfaces are not easily scratched or galled. (Q9p; Ti)

832-Q. Test Methods for Magnesium Surface Treatments. F. W. Pfohl and H. T. Francis. Armour Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131600, Nov. 1957, 62 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

New method based on measurement of paint adherence after exposure to a corrosive environment. The technique involved the "gauze-peel test", in which a gauze strip is embedded in the organic coating. After exposure to accelerated corrosion, the gauze is peeled from the surface. Both quantitative evaluations (peel strength) and qualitative (visual examination of the stripped area) can be easily made.
(Q10c, L-general; Mg)

833-Q. The Determination of the Effect of Heat Treatment on the Elevated Temperature Stress-Stability of Titanium Alloys. G. A. Lenning, M. L. Greenlee, W. M. Parris and H. D. Kessler. Titanium Metals Corp. of America. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131724, Feb. 1958, 87 p. (Available from U. S. Office of Technical Services, Washingtor 25, D. C.) $2.25.

Determination of the effects of heat treatment on the stress stability or notch stability of three Ti alloys representative of the alpha-beta type. Ti-140A (2Fe-2Cr-2Mo), Ti-155A (5Al-1.5 Fe-1.5CR-1.5Mo), and Ti-6Al-4V. Duplex solution and age-type heat treatments were shown to provide improvement in strength and creep resistance of the alloys without loss of either stress stability or notch ductility.
(Q23, Q27a, Q3m, 2-64; Ti-b)

834-Q. Development of Improved Titanium Alloys for Application at Elevated Temperatures. B. S. Lement. Manufacturing Laboratories, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131749, Mar. 1958, 73 p.

(Available from Office of Technical Services, Washington 25, D. C.) $2.

Aluminum improves high-temperature strength of titanium, but higher than 6% the alloys may be brittle at room temperature. Nature of this embrittlement studied in binary alloys containing 6 to 12% Al. Changes in bend ductility, hardness, precision length, electrical resistance, lattice parameters and microstructure which occur on solutionizing and aging.
(Q-general, 2-62; Ti-b)

835-Q.* (French.) **Microhardness Testing Reveals Stress Undergone by Copper and Copper Alloy Parts.** Pierre-Julien Le Thomas. *Fonderie,* no. 148, May 1958, p. 201-210.

Case histories of eight types of test pieces and parts subjected to various types of fatigue testing or broken in actual service. Influence of temperature, load, work conditions, chemical composition and other factors. 3 ref. (Q29q, Q7; Cu)

836-Q.* (German.) **Twin Formation in Zinc Monocrystals.** Rolf Siems and Peter Haasen. *Zeitschrift für Metallkunde,* v. 49, May 1958, p. 213-219.

Mechanism of twinning. Loading was increased step-by-step until twins occurred and the twinning was studied by means of microscopy and micro-cinematography. The role of local stress in twin formation was investigated. (Q24b; Zn)

837-Q. (Japanese.) **High-Strength Stainless Steels.** K. Toda. *Metals,* v. 28, June 1958, p. 401-408.

Review of recently developed steels such as 17-7 PH possessing high strength in addition to corrosion resistance. Mechanical properties, composition, structure and method of hardening.
(Q-general, J-general, M27; SS)

838-Q.* **Production and Properties of Aluminum Alloyed Cast Cupro-Nickel.** G. L. Lee. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 570-577.

Two copper-12% nickel alloys developed for marine fittings exhibit high strength and ductility, excellent corrosion resistance. 5 ref.
(Q-general; Cu-b, Ni-b, Al-b)

839-Q.* (French.) **Brittleness of Tantalum in Presence of Hydrogen at Atmospheric Temperatures.** Auguste Clauss and Hubert Forestier. *Comptes Rendus,* v. 246, June 9, 1958, p. 3241-3243.

When traces of dissolved oxygen are present in lattice, Ta reveals abnormal brittleness during deformation in presence of H; decrease of tensile strength varies with speed of application of load. If load in excess of break load of Ta wire in presence of H is applied to wire in vacuum, subsequent admission of H does not cause rupture. Study of modulus of torsion reveals that H does not affect domain of elastic deformations. (Q26s, 2-66; Ta, H)

840-Q. (French.) **Cast Tensile Test Bars for Nonferrous Sand-Cast Alloys.** Dominique Arnaud and Andre Lefebvre. *Fonderie,* no. 145, Feb. 1958, p. 64-74.

At present, only machined tensile test bars are accepted in France for testing of nonferrous foundry products. Study was undertaken to show economies of time and money made possible by use of unmachined bars. As-cast as well as machined bars of eight Al alloys and two bronzes made with new metals (U-E8 and U-E10) were tested. Method of fabrication of bars. 13 ref. (Q27, S22; Al-f, Cu-s, 5-60)

841-Q.* (French.) **New Rheological Creep Model.** C. Crussard. *Revue de Metallurgie,* v. 55, Apr. 1958, p. 375-382.

Proposed model has viscous "centers of creep" which interact elastically on each other. Application of force to one of these centers causes appearance of a transient order and a stationary regime. Calculations show that transient regime is represented by sum of exponential terms, for which observed parabolic laws provide a very close approximation. 11 ref. (Q3, U10e)

842-Q.* (Japanese.) **Hot Workability of Low Carbon Steel.** T. Akutagawa, Y. Michima, E. Asano and A. Suseki. *Engineering Research Institute of Tokyo University, Annual Report,* v. 6, Mar. 1958, p. 49-54.

Influence of Cu and Sn in carbon steel (0.08-0.20% C.) on the hot workability of special shaped steel. Three methods used for the test: hot bending test; hot rolling test; microstructure test. It was concluded that Cu and Sn in steel were concentrated at or near the surface through oxidation reaction; this be-

comes one of the chief reasons for surface cracks.
(Q23, Q4, M27; CN, Cu, Sn)

843-Q. Change of Strain Hardening Coefficient Accompanying Austenite-Martensite Transformation During Plastic Deformation. M. G. Gaidulov and V. D. Sadovskii. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 4-8. (Henry Brutcher, Altadena, Calif., translation no. 4214.)

Result of investigating the increased tensile strength of austenitic steels in which plastic deformation is attended by transformation from austenite to martensite. The character of the change in the stress coefficient is directly bound to the resistance of austenite-to-martensite transformation. Development of martensite during plastic deformation results in higher stress coefficient. There is a mutual bond between plastic flow and martensitic transformation. 14 ref.
(Q25, Q27a, N8p; SS)

844-Q.* Regularities in Creep and Hot-Fatigue Data. A. Graham and K. F. A. Walles. *Aeronautical Research Council,* C.P. no. 379, 1958, 25 p.

A theory is advanced to analyze data in the creep-rupture and hot fatigue data of engineering materials. The theory enables data for different times and temperatures to be classed together, thereby providing information over a much greater temperature range. An underlying numerical pattern common to all the widely different group VIII materials considered shows through the experimental scatter. 6 ref. (Q3, Q7)

845-Q.* Fatigue Properties of Two Aluminum Die-Casting Alloys. G. W. Stickley and J. L. Miller. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 292-299.

Results of reversed bending and axial-stress fatigue tests of 218 and 380 Al die-casting alloys at room temperature, and of reversed bending tests at temperatures up to 500° F. 6 ref. (Q7, Al-b)

846-Q. Comparison of Properties of Liquid and Air-Quenched Pearlitic Malleable Irons. Pt. 2. Duplex, Cold-Melt Process and Alloyed Pearlitic Malleable Irons. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 304-313.

Hardening by liquid quenching, and then drawing (tempering) shown to be a successful means for producing the ASTM 60003 and 80002 grades in all foundries. Air quenching and drawing (tempering) is successfully used to produce ASTM 60003 and lower yield strength grades such as 53004, 48004 and 45007. (Q-general; CI-s)

847-Q. Effects of Geometry on the Properties of Gun-Metal (88-8-4) Castings. W. H. Johnson. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 314-318.

The gun-metal castings exhibited pronounced edge-to-center effects, with the mechanical properties varying from values higher than for the test bars to values considerably lower. Vacuum degassing did not always improve the mechanical properties, and in some cases it had a deleterious effect.
(Q-general, E25s 3-73; Cu-s)

848-Q. Some Observations on Galvanizing Embrittlement of Malleable Iron. R. W. Sandelin. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 409-418.

The galvanizing embrittlement of malleable iron is directly related to its chemical composition, namely, the phosphorus and silicon content. A pretreatment consisting of heating to 1200° F., followed by water quenching, before galvanizing, will eliminate the possibility of embrittlement. 6 ref. (Q26s, L16; CI-s)

849-Q. Effect of Carbon and Manganese on Properties of Constructional Steels for Dynamic Loading Applications. R. D. Engquist. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 419-423.

(Q25; ST, C, Mn, 2-60)

850-Q.* Fracture Characteristics of Copper-Base Alloys. N. C. Howells and E. A. Lange. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 462-468.

Fracture characteristics of 15 Navy Cu-base alloys. Interrelationships between Charpy V energy, tensile elongation and notch ductility for these alloys. (Q26; Cu-s)

851-Q.* The Effect of Cold Work on the Irradiation Stability of Beta Heat Treated Uranium. W. R. Thomas. *Atomic Energy of Canada Ltd.,* CRMET-766, 24 p.

Effect of cold work on the irradiation stability of beta heat

treated uranium has been measured for amounts of cold work varying from 0.70 to 5.8%. Cold work was introduced into full length NRX rods by cold drawing through a circular die. It was found that the surface finish of the rods after drawing was excellent and that the rate of irradiation growth as a function of cold work can be expressed by an equation. 8 ref.
(Q-general, P10d, 2-67, 3-68; U, 2-64)

852-Q.* Properties Affecting Suitability of 9 Per Cent Nickel Steel for Low-Temperature Service. T. N. Armstrong, J. H. Gross and R. E. Brien. Digest from "ASME-AWS Joint Metals Engineering Conference, Paper 58-MET-3". *Mechanical Engineering,* v. 80, July 1958, p. 81.

Charpy values for both keyhole and V-notch specimens are reported for test temperatures down to −320° F. and results for drop-weight tests on ½ and 1 in. plate at −320° F. Welding procedures using both the metal-arc process with covered electrodes and the inert-gas metal-arc process; test values for welds made by each process. Fatigue properties and comparison of plastic fatigue strength with that of several other pressure vessel steels.
(Q-general, 2-63; ST, Ni)

853-Q.* Design Values for Thermal Stress in Ductile Materials. B. F. Langer. Digest from "ASME-AWS Joint Metals Engineering Conference, Paper 58-MET-1". *Mechanical Engineering,* v. 80, July 1958, p. 81.

Methods proposed for application of strain-cycling data to practical design problems involving thermal stress. Multi-axial stress conditions; combined steady and alternating stress; cumulative damage. When the calculated thermal stress exceeds the yield stress of a ductile material, some of the commonly used concepts, such as the Soderberg diagram, must be modified.
(Q25p, 17-51)

854-Q.* Pressure Equipment for Low-Temperature Service. C. K. Soderberg. Digest from "ASME-AWS Joint Metals Engineering Conference, Paper 58-MET-9". *Mechanical Engineering,* v. 80, July 1958, p. 82.

Four most common test categories —stress level in path of advancing crack, fracture appearance, ductibility and impact energy. Materials and fabrication. An approach for the avoidance of brittle failure is suggested. (Q26s, T26q, 2-63)

855-Q.* Factors Affecting Residual Stress in Electrodeposited Metals. Pt. 4. Joseph B. Kushner. *Metal Finishing,* v. 56, July 1958, p. 52-55, 59.

An equation has been proposed giving the relationship of residual stress with thickness of deposit. There appears to be no relation between the known effect of anions on overvoltage and the residual stress in Ni deposits which apparently invalidates the excess energy type theories. 63 ref. (Q25h, 8-62; Ni)

856-Q.* Temperature Dependence of Internal Friction in Germanium. P. D. Southgate. *Physical Review,* v. 110, May 15, 1958, p. 855-857.

The internal friction of Ge measured as a function of temperature at 100 kc/sec. There is a peak at 420° C. and little further rise to within a few degrees of the melting point. A specimen strained in tension shows a rapid rise with temperature above 500° C. Results compared with those of Kessler and it is suggested that the high-temperature rise found in all his specimens is due to thermal stressing. A small peak at 770° C. is attributed to the presence of oxygen in the Ge.
(Q22, 2-61; Ge)

857-Q.* The Effect of Neutron Irradiation on the Impact Properties of En2 Mild Steel. I. L. Mogford, A. T. Churchman and D. Hull. *United Kingdom Atomic Energy Authority,* AERE M/R 2485, Feb. 1958, 10 p.

The impact properties of En2 mild steel have been measured after irradiation with neutrons to a maximum integrated dose of 9.3×10^{19} neutron cm^{-2}. The increase in the transition temperature is approximately proportional to the cube root of the dose. At the maximum dose the rise in transition temperature is 75° C. There is a reduction in the energy absorbed in ductile fracture after irradiation which is approximately 50% for specimens given high doses. 16 ref. (Q6n; Cn, 2-67)

858-Q.* A Theory for Preheating of Plain, Low-Carbon Steels. E. Paul Degarmo. *Welding Journal,* v. 37, Mar. 1958, p. 93s-96s.

Six possible effects of preheating —reduced microhardness, increased width of the heat affected zone, reduced shrinkage stresses, changed hydrogen content, more favorable microstructure and reduced microcracking—are considered. From a consideration of the requirements

for microcracking, retained austenite and hydrogen, a theory is developed which states that it is the elemination of retained austenite at low temperatures, due to the greatly reduced cooling rate below 400° F., which results from preheating, that accounts for the beneficial results obtained. 8 ref.

859-Q.* Evaluation of the Kinzel Test From Its Fracture Characteristics. R. D. Stout, W. J. Murphy and R. C. Westgren. *Welding Journal*, v. 37, Mar. 1958, p. 107s-113s.

The Kinzel test showed welding raises the ductility transition of steel by producing a trigger for cleavage-crack initiation in the vicinity of the weld. In the carbon steels tested, the coarse-grained region was usually the source of the cleavage crack; while in low alloy steel, initiation more commonly occurred in the intercritical zone. Preheating and the heat-input level were not effective in changing the transition temperature, but postheating restored much of the notch toughness lost by welding. The Kinzel test proved sensitive to the loading level at the instant of cleavage initiation. 3 ref.

860-Q.* Controlled Low-Temperature Hot Rolling as Practiced in Europe. R. W. Vanderbeck. *Welding Journal*, v. 37, Mar. 1958, p. 114s-116s.

Technique used by various mills in Europe which increased notch toughness in hot rolled products. Average improvement in the 15 ft-lb. V-notch Charpy transition temperature of 20 to 45° F. is possible.
(Q6, F23)

861-Q.* Fatigue Characteristics of Single-Lap Joints of AISI 347 Brazed With a Ni-Cr-Si-B-C Alloy. R. G. Aspden and W. Feduska. *Welding Journal*, v. 37, Mar. 1958, p. 125s-128s.

Brazed specimen exhibited a fatigue endurance limit equivalent to the original annealed AISI 347 strip at room temperature, and 10% lower than the unbrazed material at 1100° F. Fatigue endurance limit of the strip tested to be 50 x 10^6 cycles with 31,600 psi. at room temperature and 31,000 psi. at 1100° F. Fatigue cracking of brazed strip occurred adjacent to the joint, rather than through the joint interface. 12 ref.

864-Q.* (Czech.) Strength of Bonded Light Metal Joints in Fatigue Testing. Vladimir Gregor. *Zvaranie*, v. 7, May 1958, p. 135-141.

Results of fatigue strength tests made on single and double overlapping epoxy bonded joints, using thin sheets of Al-Mg-Cu alloys. Compares strength of adhesive bonds to riveted or spot-welded joints.
(Q7a; Al, Cu, Mg, 7-58)

865-Q. (French.) Fatigue Failure. Investigation of Damaged Parts of Vibrator Units. *Soudage et Techniques Connexes*, v. 12, May-June 1958, p. 184-186.

Parts operate at a rate of over 10,000 strokes per min. Cracks were found at the junction between a 0.5% C steel tube and a 3% Ni steel semispherical tip, the weld being made on a backing ring. Failures result from very strong vibration sustained by the unit and defective welding. (Q7, 9-72; ST, 7-51)

866-Q.* (German.) Behavior of Light Metal Alloys at Elevated Temperatures. W. Jung-Konig and U. Zwicker. *Aluminium*, v. 34, June 1958, p. 337-345.

Uses published information and experimental data as basis for comparison of high-temperature properties of Al, Mg, and Ti alloys. Ti alloys $TiAl_6B_4$, $TiAl_7Mo_3$ selected as superior to other light alloys at temperatures up to 450 and 500° C. respectively. Above 250° C., sintered Al powder had higher strength than other Al and Mg alloys. 30 ref.
(Q-general, 2-63; Al-b, Mg-b, Ti-f)

867-Q. (Japanese.) Distribution of Pressed Surface Profiles. Pt. 4. Contact Between Rough Surfaces. Akira Iwaki and Masaki Mori. *Japan Society of Mechanical Engineers, Transactions*, v. 24, Feb. 1958, p. 83-88.

Presents transformation law of distribution of roughness pressed on

mirror surface. Investigates change of roughness in case of contact between two rough surfaces by comparing distribution curves of roughness pressed on mirror surfaces corresponding to roughness of pressing surface. Gap and contact ratio can be presumed by calculating both distribution functions of roughness. (Q9)

868-Q.* (Italian.) **Dependence of Elastic and Anelastic Parameters on Concentration in Antimony-Bismuth Alloys.** Kamal Matta and Italo Barducci. *Ricerca Scientifica,* v. 28, Mar. 1958, p. 533-540.

Electro-accoustical method was used to determine modulus of longitudinal elasticity, modulus of torsion, speed of propagation of elastic waves, coefficient of contraction and logarithmic decrement of oscillations. Comparison of results with those of similar study of Ag-Au alloys permits general conclusions regarding behavior of binary alloys characterized by complete miscibility in the solid state in all proportions. 4 ref. (Q21, Q22, 2-60; Sb, Bi)

869-Q.* (Russian.) **Mechanism of Brittle Failure in Steel.** B. S. Kasatkin. *Svarochone Proizvodstvo,* June 1958, p. 24-28.

Brittle failure is a two-stage process. The first stage is breaking down of the grains accompanied by plastic deformation and the formation of internal microcracks. In the second stage cracks develop on the thin surface layers, extending to the bottom of the break, and spreading crosswise to the partially deformed grains. 8 ref. (Q26s; ST)

870-Q.* (French.) **Mechanical Properties of the Isothermal Decomposition Products of Austenite in Three Construction Steels.** R. Potaszkin and K. Bar-Avi. *Revue de Metallurgie,* v. 55, Apr. 1958, p. 345-363.

Specimens of SAE 3140, 4140 and 1340 steels were studied in tempered as well as untempered state after transformation. In all cases, lower bainite was found to have mechanical properties comparable to those obtained by quench and temper; untempered upper bainite revealed low values for yield strength, reduction of area and impact strength. 6 ref. (Q-general, N8g, N8m; ST)

871-Q.* **An Investigation of Plastic Stress-Strain Relationships Using Grooved Tensile Specimens.** J. P. Ellington. *Journal of the Mechanics and Physics of Solids,* v. 6, July 1958, p. 276-281.

Determination of plastic potential of thoroughly annealed brass and copper. The brass was found to have a Mises potential (the strain-rate being proportional to the deviatoric stress); copper showed a deviation from this potential, presumably due to anisotropy. (Q25n; Cu, Cu-n)

872-Q.* **Fracture Mechanism of Semi-Brittle Steels in Torsion.** J. B. Hunt. *Journal of the Mechanics and Physics of Solids,* v. 6, July 1958, p. 321-326.

The petal-shaped pattern noticed on the fracture surface of certain mild steels tested in torsion led to investigation of the mechanism of a type of fracture hitherto assumed to be a conventional shear separation. It was found that the fracture sequence involved both tensile failure and sliding in shear. (Q26, Q1a; ST)

873-Q.* (English.) **Study of the Behavior at High Temperatures of Nodular Cast Irons Alloyed With Silicon.** T. Dumitrescu, Maria Nicolaid and Pamfil Iliescu. *Revue de Métallurgie, (Bucarest),* v. 1, 1956, p. 33-53.

Nodular cast irons alloyed with Si, especially those with a Si content of 4.5-6%, are superior to Al cast irons and many oxidation resistant cast irons as regards mechanical properties, dimensional stability at high temperatures and resistance to oxidation. 8 ref. (Q-general, 2-60; CI-r, *Si*)

874-Q. **Set-Resistance of Spring Steel Strips at Room Temperature.** V. Ya. Zubov and S. V. Grachev. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 20-23. (Henry Brutcher, Altadena, Calif., Translation no. 4218.)

Setting characteristics of spring steel strips bent into rings of different types. Silicon steel alloyed with W and Mo (EI 722) has considerably greater resistance to relaxation than steels EI 142 and V 10 A with lower Si content. Three different kinds of hardened unannealed steel showed lower resistance to setting. Evidently this was due to the decomposition of martensite under prolonged active tension. 6 ref. (Q3, Q21; ST, SGA-b)

875-Q. (French.) **Fatigue Strength of Some Machine Components and De-**

tailed Study of Scatter of Results. Luigi Locati. *Revue de Métallurgie,* v. 55, Apr. 1958, p. 364-374.

937-Q. (German.) **Emcotest—a New Universal Hardness Tester.** Tschirch and F. Gärtner. *Fertigungstechnik,* v. 8, May 1958, p. 225-228.

Tester with spring coupling for direct hardness measuring. (Q29)

938-Q. (German.) **Influence of the Hardening Process on the Durability of Circumference Hardened Gears.** Heinz Glaubitz. *Industrieblatt,* v. 58, June 25, 1958, p. 217-221.

15 ref. (Q9n, T7a; 2-64)

939-Q. (German.) **Rapid Testing of Various Types of Steel.** H. Haberhauer. *Maschinenbau,* Apr. 1958, p. 107-108.

Fracture test, spark test, etch test. (Q26, S10s, M20q)

940-Q. (German.) **Flaking of Steel.** F. Feeg. *Rundschau,* Feb. 1957, p. 470-474.

55 ref. (Q23; ST, 9-70)

941-Q. (Russian.) **Methodology of Determining Crack Sensitivity of Materials.** B. A. Drozdovsky and Ya. B. Friedmann. *Zavodskaya Laboratoriya,* v. 21, 1955, p. 579-590.

Crack sensitivity of a high-strength steel annealed and tempered at 200 or 510°, and heat-treated isothermally in various ways. Determination of the breakdown stress in static bending was made on notched samples, as well as on samples with cracks produced by preceding cyclic impact loading, and other methods. (Q26q; AY, 9-72)

942-Q.* Steel in Prestressed Concrete. W. O. Everling. *Blast Furnace and Steel Plant,* v. 46, July 1958, p. 691-697.

Stress strain curves, relaxation, creep and tensile properties of prestressing wire for prestressed concrete structures. Elastic properties of wire, cold drawn, stress relieved, oil tempered or lead patented. Sensitivity to stress corrosion and fatigue as demonstrated by tests in hot ammonium nitrate solutions. Protection afforded by concrete.
(Q27a, Q23b, T26p, CN-r, 4-61)

943-Q.* Which High Strength Steel? Robert J. Nekervis, C. H. Lund and A. M. Hall. *Materials in Design Engineering,* v. 48, July 1958, p. 84-89.

Advantages and limitations for use in aircraft; tensile strength, yield strength, creep and stress rupture properties of hot work toolsteels, martensitic stainless steels, low alloy steels, precipitation hardenable, semi-austenitic stainless steel and austenitic stainless steel.
(Q27, Q3; SS, TS)

944-Q.* The Fatigue Strength of Specimens Cut From Pre-Loaded Blanks. N. E. Frost. *Metallurgia,* v. 57, June 1958, p. 279-282.

Prior fatigue loading of blanks did not significantly alter fatigue

strength of B.S. L65 Al specimens cut from the body (i.e., remote from pre-surface of material). Static pre-loading, compression or torsion caused an increase in fatigue strength for mild steel. The strength increased literally with amount of pre-strain. Similar pre-loading caused decrease in fatigue strength for alloy. 5 ref.
(Q7, Q23; Al-b)

945-Q.* High-Strength Nonmagnetic Alloys. *Materials in Design Engineering,* v. 48, Aug. 1958, p. 104-106.

Many applications require nonmagnetic alloys with tensile strengths about 200,000 psi. and approximately 5% elongation. The copper and cobalt-base alloys, titanium alloys, and austenitic stainless steels come closest to these values. Magnetic properties of specific alloys are discussed.
(Q-general, P16; Co-b, Cu-b, Ti-b, SS)

946-Q.* Behavior of Certain Alloys Subjected to Dynamic Loading. Ralph G. Crum and F. T. Mavis. *ASTM Bulletin,* no. 231, July 1958, p. 88-91.

A spring-powered impact apparatus and a data recording system for dynamic tension tests of 0.25-in. diameter specimens. Steel, Al and Ti alloys were tested statically and dynamically at constant or slightly increasing velocity from impact to fracture. Yield and ultimate strengths are greater for dynamic loading than for static loading. The ductility of specimens of a given material was essentially the same whether the specimens were loaded statically or dynamically. 6 ref.
(Q6, Q23b, Q23p; Al-b, Ti-b)

947-Q.* The Initiation of Cleavage Fracture at the Intersection of Deformation Twins in Zinc Single Crystals. R. L. Bell and R. W. Cahn. *Institute of Metals, Journal,* v. 86, June 1958, p. 433-438.

Detailed observations demonstrate that the cleavage fracture of single crystals of Zn of a special orientation, tested in tension at room temperature, started at the points of high stress concentration resulting from the meeting of pairs of twin lamellae on the systems (1012) and (1012). 14 ref. (Q26n; Zn, 14-61)

948-Q.* The Development of Microscopic Inhomogeneities of Deformation in Polycrystalline 70:30 Brass: Some Effects of Method of Deformation. L. E. Samuels and M. Hatherly. *Institute of Metals, Journal,* v. 86, June 1958, p. 442-446.

The incidence of two types of microscopic inhomogeneity of deformation (lamellar slip bands and kink bands) in polycrystalline 70-30 brass is found to vary markedly with different methods of unidirectional deformation. The kink-band type of inhomogeneity does not influence strain-hardening, but the slip bands do have a small influence, particularly when the bands develop on multiple systems. This is interpreted as indicating that strain-hardening is due largely to interference between intersecting slip systems. 18 ref. (Q24; Cu-n)

949-Q.* The Effect of Neutron Irradiation on the Mechanical Properties of Copper and Nickel. M. J. Makin. *Institute of Metals, Journal,* v. 86, June 1958, p. 449-455.

The yield stress of both metals is increased by irradiation, and the increase is markedly temperature-dependent, being very much greater at low temperatures than at high. The temperature variation in yield stress after irradiation is a reversible phenomenon and is not due to an annealing effect at the higher temperatures. The rate of work hardening is greatly reduced by irradiation, especially at low strains. The ultimate tensile strength is increased and the elongation to fracture is reduced by irradiation. Results are discussed in terms of the possible mechanism of irradiation-hardening. 9 ref. (Q23, Q27a; Cu, Ni, 2-67)

950-Q.* How to Make Hydraulic Tubing Last Longer. C. S. Yen and J. L. Waisman. *Metal Progress,* v. 74, July 1958, p. 88-92.

Roughness of the tube surface, amount of flattening in a bend and tensile strength are controlling factors. Careful attention to these variables is necessary if the tube system is to endure the changing stresses caused by pressure pulses.
(Q7k; 4-60)

951-Q.* Molybdenum Is Here to Stay. J. L. McCloud. *Metal Progress,* v. 74, Aug. 1958, p. 75-78.

Molybdenum is pre-eminent among metals for high-temperature uses and is solidly entrenched in the electronics industry and for missile parts whose working life is very short. Protective coatings have been perfected so gas turbine blades can run at 2000° F.
(Q-general, 2-62, T24e, T1, 17-57; Mo)

952-Q.* W-545 . . . a Better Turbine Disk Alloy. J. T. Brown. *Metal Progress,* v. 74, Aug. 1958, p. 87-90.

A new iron-base turbine disk alloy having a good combination of high-temperature stress-rupture strength and ductility, and low-temperature tensile strength has been developed. Boron in amounts from 0.005 to 0.15% increases the inherent ductility of the present austenitic precipitation hardening alloys. Further strengthening, by additions of larger amounts of titanium, is then possible without allowing the material to become notch sensitive. (Q-general, T7h, 17-57, 2-62; Fe, SGA-h)

953-Q.* Influence of Hotworking Conditions on High-Temperature Properties of a Heat-Resistant Alloy. John F. Ewing and J. W. Freeman. *National Advisory Committee for Aeronautics Report 1341,* 1957, 52 p.

An alloy containing 20% Cr, 20% Ni, 20% Co, 3% Mo, 2% W and 1% Cb was investigated. Limited isothermal deformations increase strength. Larger reductions either do not increase strength or cause a decrease. Thus, high-production processes, giving large reductions at essentially constant temperature, lead to low or medium strength in the hot worked condition. Working over a falling-temperature range, with finishing temperatures as high as 1800° F. or higher, can give very high strengths at 1200° F., equal to those usually obtained only by hot-cold-work. (Q-general, 2-62; Cr, Ni, Co, Mo, W, Cb, SGA-h)

954-Q. Fracture Types in Germanium and Silicon Crystals. V. P. Mitrenin and B. V. Aleksandriya. Paper from "Growth of Crystals", Consultants Bureau, Inc., 1958, p. 135-138.

Specific shapes of Ge and Si crystal fracture are described from observations made by electron microscopy. The crystals were fractured by moderate blows. Reciprocal lattice X-ray data were used to determine the crystallographic plane orientations. Photomicrographs show the conchoidal fracture in a Ge single crystal with clearly developed steps on the (111) plane. The steps are approximately parallel and almost right-angled fractures occur on them. (Q26; Ge, Si, 14-61)

955-Q. Preliminary Microscopic Studies of Cermets at High Temperatures. E. T. Montgomery, T. S. Shevlin, H. M. Greenhouse and H. W. Newkirk. Ohio State University Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131470, Apr. 1955, 40 p. $1.25.

High-temperature (to 1800° F.) properties of the promising cermet IIIB (55.4 TiC-17.9 TiB_2-10.0 Si-16.7 Co). (Q-general, 2-62; 6-70)

956-Q. Ceramic Reinforced Alloys and Plated Cermets. M. T. Curran. New York State College of Ceramics. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131188, May 1957, 49 p. $1.25.

A precision technique was developed for casting superalloys around ceramic rod reinforcement. Electroplating of cermets with Ni and Cr improves their impact resistance. (Q-general; Cr, Ni, Mo, 6-70, 8-12, 8-69)

957-Q. Lubrication of Titanium. R. O. Lee and N. Fatica, Clevite Research Center. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131650, Dec. 1957, 51 p. $1.50.

Role of oxide films on Ti, the frictional properties of modified Ti coatings, and the comparative wear resistance of the best surface treatment in the presence of various lubricants. Tests showed Halocarbon 11-14 to be the most effective lubricant on treated and untreated surfaces. (Q9n, 18-73, 2-61; Ti)

958-Q. Development of Electroplating Processes to Eliminate Hydrogen Embrittlement in High-Strength Steel. J. E. Chilton. Stanford Research Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131721, Jan. 1958, 84 p. $2.25.

Electrodeposition of Cd on a high-strength, aircraft quality steel. (Q26s, L17; SS, *Cd*)

959-Q. Investigation of the Effects of Incongruous Elements and the Interaction Effects of These Elements on High-Temperature Strength of Fe-Co-Ni-Cr Alloys. J. H. Sye, T. L. Robertshaw and F. M. Richmond. Universal Cyclops Steel Corp. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131614, Dec. 1957, 110 p. $2.50.

Effect of five combinations of incongruous elements on the high-temperature properties of vacuum

melted alloys with a base composition of 60 at. % Ni, 20 at. % Cr, 10 at. % Fe, 10 at. % Co. (Q-general; 2-62, 1-73, AD-q, Fe, *Co, Ni, Cr*)

960-Q. Effects of Temperature-Time-Stress Histories on the Mechanical Properties of Aircraft Structural Metallic Materials. Pt. 1. Temperature-Time Studies for 2024-T3 and 7075-T6 Alclad Sheet. R. E. Fortney and C. H. Avery. Northrup Aircraft, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131520, Sept. 1957, 214 p. $5.50.

Tensile properties of 2024-T3 Alclad and 707 5-T6 Alclad sheet were determined at room temperature, 200, 300 and 400° F. after single and sequential multiple exposure in the range 250 through 600° F. (Q-general, T24a; 2-62, Al-b, ST, 4-53, 8-66)

961-Q. Metals for High Temperature Hydraulics. Arne Mars and N. M. Lazar. *Aviation Age,* v. 30, Aug. 1958, p. 82-88.

Creep-rupture and fatigue strength of toolsteels and PH stainless. (Q3, Q7, T24, 17-57; TS, SS)

962-Q. Magnesium-Lithium Alloys. *Metal Industry,* v. 92, June 6, 1957, p. 476.

(Q23p, Q27a; Mg, Li)

963-Q. (Russian.) **Sag of Turbine Shafts and Rotors in the High-Temperature Test.** M. Ya. Fuks and I. K. Glazyak. *Vestnik Mashinostroeniia,* no. 6, 1955, p. 30-34.

Tests to determine the ability of turbine shafts and rotors to maintain rectilinear axes when heated. Experimental heating tests on shaft blanks in electric furnace; influence of repeated machining and of surface condition on the temporary bending deflection of shafts. (Q5, T7; 2-62)

964-Q.* (Russian.) **Physical Mechanism of Plastic Deformation of Polycrystalline Iron During Drawing.** Alois Mashin and Miroslav Mrazek. *Acta Technica,* v. 3, no. 3, 1958, p. 218-240.

Experiments using microscope and X-ray on 5.5-mm. Armco iron wire, (composition: 0.015% C, 0.011% Mn, 0.014% P, 0.015% S, 0.03% Ni and 0.005% N). The clearest morphological changes of grain shape took place at temperatures of 44-76°. The major form of deformation is the development of creep in grain boundaries with its consequent disordered mechanism. Appearance of deformation bands is related to temperature level and not to number of times wire is drawn. 13 ref. (Q24, Q3, F28; ST, 4-61)

965-Q.* Effect of Neutron Irradiation on the Mechanical Properties of Copper and Nickel. M. J. Makin. *British Nuclear Energy Conference, Journal,* v. 3, July 1958, p. 174-180.

Effect of neutron irradiation at 100° C. with 5×10^{19} n. per sq. cm. on the mechanical properties of annealed polycrystalline Cu and Ni is studied at a variety of temperatures. The yield stress of both metals is increased by the irradiation, and the increase is markedly temperature-dependent, being very much greater at low temperatures than at high. 10 ref. (Q-general; Cu, Ni, 2-67)

966-Q.* Electron Microscope in the Study of Wear. D. Scott and H. M. Scott. *Electron Microscopy, Proceedings of the Stockholm Conference,* Sept. 1956, p. 331-333.

Replica techniques permit detailed examination of worn areas, effects of fretting corrosion, lubricants, study of debris. 8 ref. (Q9n, M20r; ST, TS)

967-Q.* Transgranular and Intergranular Fracture of Ingot Iron During Creep. L. A. Shepard and W. H. Giedt. *National Advisory Committee for Aeronautics, Technical Note 4285,* Aug. 1958, 32 p.

Creep tests were performed on coarse-grained ingot iron over a temperature range from 700 to 1350° F. to find whether the amount of grain-boundary sliding determined the fracture mode, either transgranular or intergranular. 24 ref. (Q26; Fe)

968-Q.* Effect of Temperature on Dynamic Modulus of Elasticity of Some Structural Alloys. Louis F. Vosteen. *National Advisory Committee for Aeronautics, Technical Note 4348,* Aug. 1958, 21 p.

Effect of temperature from 70-900° F. on Young's modulus of 2024-T3 and 7075-T6 Al alloys, AZ31A Mg alloy, RS-120 Ti alloy, and Type 303 stainless steel, 15 ref. (Q21a, 2-61; Al-b, SS, Ti-b, Mg-b)

969-Q. Energy of a Deformed Crystalline Lattice. N. S. Fastov. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic*

Energy Commission, AEC-tr-2924, 1958, p. 257-264. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

During plastic deformation the greatest part of the total work spent on deformation is dissipated as heat and only a certain part (not more than 10-15%) is transformed into energy of residual stresses—energy of second and third order deformation of the lattice. The overwhelming proportion of the energy of residual stresses is absorbed by third order deformations. During deformation the metal becomes stronger and this strengthening is always accompanied by second and third order deformations. As the degree of plastic deformation increases, the strengthening coefficient decreases. 8 ref. (Q24, M26)

970-Q.* Internal Friction. Stress Relaxation Across Interfaces. P. M. Robinson and R. Rawlings. *Iron and Steel*, v. 31, Mar. 1958, p. 97-100.

Important source of internal friction is stress relaxation across incoherent interfaces, such as grain boundaries and interfaces between different phases. Various investigations and observations on dampening due to relaxation across the grain boundaries are cited. Internal friction due to defects in metals, such as dislocations and vacancies. 51 ref. (Q22)

971-Q. Effect of Alloying Admixtures on the Temperature Dependence of the Shear Modulus of Iron. N. S. Rysina and B. N. Finkelshtein. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission*, AEC-tr-2924, 1958, p. 289-293.

The shear modulus of pure iron, as well as that of Fe alloyed with Co, V or Mn, starts diminshing rapidly at 360°; in Mo steel the modulus remains relatively high to 480°. Above 560°, the modulus of pure Fe drops fastest, while V exerts the maximum detaining action on the reduction in the modulus at these temperatures.
(Q21d, 2-60; Fe, *Co, V, Mn, Mo*)

972-Q.* (Czech.) Mechanical Properties of the Hardened Layer of Cast Iron Rolls. Robert Kamensky. *Hutnicke Listy*, v. 13, 1958, p. 502-505.

Effect of alloy contents and distance from surface on mechanical properties of cast iron rolls. Greatest strength found on external border of hardened layer. Strength fell rapidly in direction of roll center as consequence of grain growth in hardened layer. In transition layer strength increased with graphite content. Modulus of elasticity decreased from surface to center of the roll. Alloying with Mo increased strength of hardened layer and decreased its modulus of elasticity. (Q29, Q-general, W23k, 2-60; CI)

973-Q.* (Czech.) Morphology of a Brittle Structural Component Formed During Resistance Welding of Low-Carbon Steels. Dasaalvan Hrivnak. *Hutnicke Listy*, v. 13, 1958, p. 512-517.

Electron microscope investigation reveals two morphological groups of brittle compound, one without regular design and the other with fine martensitic design. Modification of component characterized by granular substructure; suggests substructure is an orthorhombic unstable crystallization. 4 ref. (Q26s, M27, M21e, K3; CN)

974-Q.* (Czech.) Contribution to the Problem of Longitudinal Crack Formation in Rail Foot After Straightening. Slavomir Horejs. *Hutnicke Listy*, v. 13, 1958, p. 517-526.

Factors contributing to cracking include severe straining during straightening; undersurface bubbles, laminated flat and unfavorably oriented to the surface, fibers in middle sphere of rail foot oriented perpendicular to surface. 27 ref. (Q26q, T23q; ST)

975-Q.* (French.) Formation of Sound Waves in Metal Specimens During Tension Tests. J. B. Lean, J. Plateau, C. Bachet and C. Crussard. *Comptes Rendus*, v. 246, May 19, 1958, p. 2845-2848.

Tension tests were carried out on specimens of extra-mild steel at temperatures ranging from +200 to −196° C. Sound waves are emitted during formation of Luder's lines or waves of plastic deformation corresponding to Portevin-LeChatelier effect. Brittle fracture at low temperature, without appreciable elongation, is preceded by identical sound waves. 4 ref. (Q27, Q21f; ST)

976-Q.* (German.) Creep and Tension Loss of Steel Wire, Particularly at Slightly Elevated Temperatures. Werner Papsdorf and Fritz Schwier. *Stahl und Eisen*, v. 78, July 10, 1958, p. 937-947.

Tests at 22 to 150° C. indicate that creep or loss of tension is a function of heat, load and time. Increasing temperatures, at 55 to 60% load, increase the loss of wire tension up to 1000 hr. Beyond this point, the influence of temperature on tension loss decreases; the same occurs when load is increased at constant temperature. Nature and extent of creep can be projected and trend of tension determined over 100 years. Properties of steel wire are subject to alterations after creep tests have been conducted under heavy loads, and this has been found to be in conformity with the theory of creep at room temperature. 31 ref. (Q3, Q27a; ST, 4-61)

977-Q.* (Japanese.) **Austenitic Stainless Steel Tubes for High-Temperature and High-Pressure Boilers.** Toshio Ikeshima, Jimpel Omori, Toyohiko Okamoto, Eiji Miyoshi, Shoji Terai and Hidetoshi Maruoka. *Sumitomo Metals,* v. 10, Jan. 1958, p. 9-30.

Manufacture of tubes from Types 321 and 327 stainless steels for use in superheaters in modern power boilers. Mechanical properties, tube dimensions and microstructure at room temperature. Mechanical properties at elevated temperatures (400 to 800° C.), creep-rupture properties, effect of long-time heating on brittleness and other mechanical properties, oxidation resistance, microstructure following heating. Microstructure and mechanical properties of joints made by arc welding and inert-gas shielded-arc welding utilizing various electrodes before and after prolonged exposure to high temperatures. Influence of severe cold bending on tube dimensions, mechanical properties and microstructure.
(Q-general, 2-62, T26q; SS, 4-60)

978-Q.* (Japanese.) **Fatigue Test Results With Large Shouldered and Force-Fitted Specimens.** Naoteru Oda and Kunio Nishioka. *Sumitomo Metals,* v. 10, Jan. 1958, p. 37-44.

Investigation of fatigue limit of stress concentration portion of railway car axles. Radius of fillet, specimen dimension and cracking corrosion related to the fatigue strength. 12 ref. (Q7k, Q7b, T7j; ST)

979-Q.* (Japanese.) **Rotating-Beam Fatigue Test of Cast Aluminum Alloys.** Katsuzi Takeuchi. *Sumitomo Metals,* v. 10, Jan. 1958, p. 45-54.

Tests on Alcoa 195, Lautal, SAE 326, SAE 329, Silumin, Gamma-Silumin, SAE 331, Alcoa 356, Y-alloy, Cobitalium, Hydronalium, Low-EX, Alcoa D 132 and RR 53 cast alloys in the ascast and heat treated conditions. Relation between fatigue strength at 10^7 cycles and tensile properties. Fatigue strength increased with increment of tensile strength up to 32 kg. per sq. mm., then decreased with further increment of tensile strength. 4 ref.
(Q7c, Q27a; Al-b, 5-60)

980-Q.* **Thick-Walled Steel Cylinders. Behavior Under Internal Pressure.** B. Crossland and J. A. Bones. *Machinery Market,* July 31, 1958, p. 17-20.

Test on thick-walled cylinders made from 0.15% C steel, 0.3% C steel and Vibrac steel, the maximum pressure reached being 42 tons per in. (Q10; CN, 4-60, 3-74)

981-Q. On the Plastic Properties of Modified Steel Kh25N20 in the Cast State. V. E. Neimark and Ya. B. Gurevich. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 439-449. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Modification of steel Kh25N20 with Ti or B improves its plastic properties in the hot state. Cast steel Kh25N20 with columnar structure has good plastic properties at room temperature, which makes it possible, with suitable tolerances for the castings, to work it in the cold state. Diffusion anneal (1250° for 1 hr.) destroys the dendrite eliquation in the cast steel and improves its plastic properties at room temperature. 24 ref.
(Q23, 2-62, 2-60; AY, *Ti, B*)

982-Q. On the Deformability of Cast Steel of Type Kh25N20. Ya. B. Gurevich and V. E. Neimark. Paper from "Problems of Metallography and the Physics of Metals", *U. S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 450-456. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Under definite conditions of working, cast steel of type Kh25N20 with columnar macrostructure has adequately high plasticity both in the hot and the cold state. The cast metal needs to be subjected to a diffusion anneal at 1250° to remove the dendrite eliquation and destroy the chi-phase, followed by cooling

in water to prevent the separating out of carbides on the grain boundaries. The allowable reduction in hot rolling is 60 to 65%. 10 ref. (Q23q, 2-62, 2-64; ST, 5-60)

983-Q.* The Influence of Ferrite Banding on the Impact Properties of Mild Steel. W. S. Owen, Morris Cohen and B. L. Averbach. *Welding Journal,* v. 37, Aug. 1958, p. 368s-374s.

Object was to compare the Charpy properties of a severely banded ferrite-pearlite structure with those of a random ferrite-pearlite distribution. Ferrite banding in reheated hot rolled mild steel is influenced by the austenitizing temperature, the time at temperature and the cooling rate. Once the banding has been completely removed by a homogenizing heat treatment, it is not re-formed by thermal treatment. 10 ref. (Q6n, Q24c, 2-64; CN)

984-Q.* Material Rating Based Upon True Stress-Strain Properties. Joseph Marin and M. G. Sharma. *Welding Journal,* v. 37, Aug. 1958, p. 375s-378s.

Interpretations were based upon data for 56 materials. Material ratings based upon the nominal and true properties are not the same. Recommended that ratings be based upon true stress-strain relations. 11 ref. (Q27, Q25n, S22)

985-Q.* (Russian.) Study of Physical Factors Determining Hardness of Iron Alloys. V. M. Golubkov, V. A. Il'ina and V. I. Kritskaya. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 465-483.

Relationship between thin crystal structure of hard alloys (using alpha-iron in hardened condition) and mechanical properties. The alloys were hardened by cold plastic deformation. To change the properties of alpha-iron crystals in the micro and submicro regions, the iron was alloyed with Si, Ti, V, Cr, Mn, Co, Ni, Nb, Mo and W. Static and dynamic displacements of atoms in crystal lattice were studied by X-ray. 38 ref.
(Q29n, M25, M26, 3-68; Fe-b)

986-Q.* (Russian.) Effect of Static Distortion of Crystal Lattice on Mechanical Properties of Aluminum and Magnesium Alloys. A. V. Grin', V. A. Pavlov and I. A. Pereturina. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 493-500.

Thermal dependence of the yield point and temporary resistivity of pure Al and its alloys at temperatures of 80 to 700° K. during 100-fold increase in speed of deformation. For pure Al at a temperature of 500° K., the relation between yield point and modulus of elasticity are not affected by temperature. However, a further rise in temperature increasingly affects this relationship. 23 ref.
(Q21a, Q23b, M26s, 2-61; Al-b, Mg-b)

987-Q. Plasticity of Heat Resistant Alloys Depending on Structure and Kind of Stressed State. M. V. Rastegaev. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 30-35. (Henry Brutcher, Altadena, Calif., Translation no. 4280.)

Plasticity of heavily deformed alloys, at the time of deformation at high temperatures and under expansion pressures, depends mainly on the form of diffusion of the second phase not in its original structure but in the structure formed during heat treatment at the moment of the start of deformation. 9 ref.
(Q24, N1, 2-62, 2-64, 3-74; SGA-h)

988-Q. Structure and Properties of Alloys After Vibrational Deformation. S. N. Shestakov and M. Ya. Karnov. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 35-38. (Henry Brutcher, Altadena, Calif., Translation no. 4281.)

Deformation by vibration results in more uniform macro and microstructure and smaller grain formation after recrystallization. Also there is greater uniformity in the hardness after vibration and lowered specific pressure. Vibro-deformation can also be used to reduce intersurface friction. Rejects common assumption that the vibration of machinery and material during usual operations is invariably harmful.
(Q24, Q29n, M27c, M28k, 3-74)

989-Q.* On Asperity Distributions of Metallic Surfaces. F. F. Ling. *Journal of Applied Physics,* v. 29, Aug. 1958, p. 1168-1174.

A distribution of surface asperities is proposed for the case in which both mating surfaces are rough and asperities are in the form of right circular cones. The load-compliance characteristics for mating surfaces having comparable roughness have slopes much steeper than those predictable by previous theories, all of which involve the assumption that one of the surfaces is smooth and rigid. 12 ref.

990-Q.* Investigation of Low-Temperature Internal Friction. Hollis L. Caswell. *Journal of Applied Physics,* v. 29, Aug. 1958, p. 1210-1214.

Internal friction in pure copper, in Cu doped with Ni and Au, and in Mg, subjected to various amounts of cold work was measured at 40 kc. from 4° K. to 300° K. 11 ref. (Q22; 2-63, Cu, Mg, *Ni, Ag*)

991-Q. (Russian.) **On the Problem of the Nature of Reversible Temper Brittleness.** L. R. Gold'shtein. *Metallovedenie i Obrabotka Metallov,* no. 11, 1956, p. 36-39.

Electron microscope and electron diffraction study of temper brittleness in steel 33 KhNZ after oil quenching from 1150° C. followed by tempering at 600 and 675° C., with different cooling rates. Destructive testing produced brittle fracture after slow cooling and ductile after rapid cooling. In both cases carbide particles were present on the fracture face. It is suggested that one of the causes of reversible embrittlement is the healing and development of breaks in the primary austenite grain boundaries as a result of the volume changes occurring during tempering, mainly in the alpha-phase and depending on the nature and amount of alloying elements. (Q26s, 2-64; AY)

992-Q. Solve Lamellar Phase Problem in A-286. Kenneth Metcalfe. *Iron Age,* v. 182, July 3, 1958, p. 72-74.

Formation of lamellar precipitate at grain boundaries results in lower stress-rupture life of A-286 stainless alloys. Lamellar phase eliminated by controlling boron content or solution treatment at 2000° F. (Q3m, N7; SS-e, *B*)

993-Q. Thermal Stresses in Design. S. S. Manson. *Machine Design,* Aug. 7, 1958, p. 100-107.

Method consists of device which measures effect of temperature variation on copra pendulum. (Q27, 2-63, 1-53; ST)

1003-Q. (Russian.) **Precise Measurement of Microhardness by Chemical Removal of Case Hardened Surface Layers.** V. N. Vigdorovich and A. E. Vol'pyan. *Zavodskaya Laboratoriya,* v. 24, June 1958, p. 762-764.

Use of various etching solutions in testing surface of Cu alloys. For Cu-Al an etch solution of $FeCl_3$ in HCl is recommended; for Cu-Ti alloy, etch with $K_2Cr_2O_7$ plus NaCl in H_2SO_4. 5 ref. (Q29q, 1-54)

1004-Q. (Russian.) **Effect of Bending During Torsion Tests.** B. A. Vandyshev and E. E. Surikova. *Zavodskaya Laboratoriya,* v. 24, June 1958, p. 764-767.

Recommends clamping device to overcome destructive effect of torsion tests. 7 ref. (Q1, 1-53)

1005-Q. A Phenomenological Relation Between Stress, Strain Rate and Temperature for Metals at Elevated Temperatures. Elbridge Z. Stowell. *National Advisory Committee for Aeronautics, Report 1343,* 1958, 6 p.

Phenomenological relation is suggested to account for behavior of polycrystalline metals above the equicohesive temperature. Properties of the metal included in the relation are elasticity, linear thermal expansion and viscosity. 9 ref. (Q25n, Q21, P10d, P10f; Al-b, 2-62)

1006-Q. Chromium-Nickel Alloys for High-Temperature Applications. A. G. Bucklin and N. J. Grant. Massachusetts Institute of Technology. (U. S. Bureau of Aeronautics.) *U. S. Office of Technical Services,* PB 131465, 1955, 18 p. $.50.

Chromium-nickel alloys containing 35 to 70% Cr with additions of Fe, Mo and Cb were precision cast and tested in stress-rupture at 1600 to 1800° F. Characteristics said to surpass those of many commercial alloys were obtained, especially in alloys containing 40 to 45% Cr, 2 to 10% Fe, 2% Mo and 2% Cb. Higher Cr alloys exhibited high hardenability, suggesting high-temerature bearing applications. (Q-general, 2-62, 17-57; SGA-h, Cr, Ni, 5-62)

1007-Q. Theory of Creep of Dispersion-Hardened Alloys. J. Weertman. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131675, Apr. 1958, 11 p. $.50.

Introduction of a finely dispersed second phase into a metal matrix is said to be the best method of improving creep resistance. The dispersed second-phase particles act as obstacles to the motion of dislocations and thus harden the alloy. This research was concerned with development of creep equations for two-phase dispersion-hardened alloys. All calculations were based on the assumption that the rate-controlling process is the climb of dislocations over second-phase particles. (Q3, N7)

1008-Q.* (English.) **Some Observations on Deformation Structures in Hand Impact Tools and in Splinters From Such Tools.** Axel Hultgren. *Jernkontorets Annaler,* v. 142, no. 5, 1958, p. 229-245.

Deformation structures showing indications of shearing heat causing transformation to austenite in a thin layer followed by martensite formation. (Q24c, Q24m, N8f, N8p, 3-68, 3-71; CN-p)

1009-Q.* (French.) **Structural Theory of Metallic Creep.** A. Oding. *Revue de Metallurgie,* v. 55, May 1958, p. 448-452.

Starting from the dislocation concept, a theory of creep is developed according to which the creep rate depends on the number of dislocations ready to begin movement. A general equation for the creep curve, in agreement with experimental data, is derived. (Q3, 10-51)

1010-Q.* (French.) **Rheological Aspects of Hardness.** A. Braun. *Revue de Metallurgie,* v. 55, May 1958, p. 470-474.

Three categories of the properties of solids are distinguishable: elasticity, plasticity and viscosity. Analysis of behavior at local deformations set up by stresses to which solid offers a resistance, which is designated hardness, shows

necessity of defining hardness related to the above three categories. Their significance flows from their relation with the respective constants of elastic, plastic or viscous matter, a relation which is called "hardness function" and which shows also whether these hardnesses are dependent on experimental conditions. (Q29)

1011-Q.* (French.) **Fatigue Under Fretting Conditions.** A. J. Fenner and J. E. Field. *Revue de Metallurgie,* v. 55, May 1958, p. 475-485.

Direct stress fatigue tests on Al alloy and on mild steel, both without clamps and under various conditions of clamping. Fretting was caused by the alternating strain in that part of the specimen spanned by the clamps, leading to reduction in fatigue strength. In Al the amount of this reduction was found to depend on the amplitude of the relative movement between clamps and specimen. 7 ref. (Q7, Q9q)

1012-Q.* (French.) **Investigation of Intercrystalline Fragility in Iron.** C. Bealieu. *Revue de Metallurgie,* v. 55, May 1958, p. 495-499.

Determination of temperature conditions and time of annealing required for brittleness. Brief elevation of temperature above A_3 or any modification of the structure of the specimen suffices to eliminate this brittleness. Various explanations of this phenomenon, which is different from brittleness, obtained after saturation with cathodic hydrogen. The fracture source would be due to formation of accumulations of dislocations and microfissures in vicinity of oxide precipitates or grain boundaries where cohesion is reduced. (Q26s; Fe)

1013-Q. (Russian.) **Effect of Local Plastic Deformation on the Strength of Steel.** A. E. Asnis. *Avtomaticheskaya Svarka,* no. 3, 1956, p. 88-94.

Effect of local cold work on static and fatigue strength of rimming and killed bessemer steel BST3 and openhearth steels MST3 and M16c. Tests were carried out at +20 and −20° C. As a result of local cold work by both shearing and punching the yield point of all the steels tested in tension rose by 5-12% while the ultimate tensile strength was reduced by almost 20% in BST3 and M16c and by not more than 8% in MST3. The effect was particularly pronounced at low temperature. Normalizing removes the effects of local cold work and almost completely restores the tensile properties. (Q27a, Q7a, 3-68; ST)

1014-Q. (Russian.) **Investigation of Plastic Properties of Beryllium Monocrystals.** R. I. Garber, I. A. Gindin, V. S. Kogan and B. G. Lazarev. *Fizika Metallov i Metallovedeniye,* no. 3, 1955, p. 529-537.

Mechanism of slipping of Be depends substantially on the temperature and orientation of the specimen. The plasticity of Be, which increases monotonically with temperature, reaches a maximum at 400° C., diminishes somewhat at 600° C., and increases again at 800° C. (Q24, 3-72; Be)

1015-Q. (Russian.) **Plastic Deformation in an Isotropic Metal Under Complex Loading.** A. M. Zaukov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* 1956, p. 72-87.

Test pieces were of Cr-Ni steel 30KhNZA with 0.30% C, 0.37% Si, 0.64% Mn, 0.74% Cr, 2.9% Ni. Pieces were oil quenched from 820° C. and tempered at 540° C. After soaking for 2 hr. one batch was oil quenched, while the other was held for another 10 hr. at 500° C. and then furnace-cooled. Reduction of impact value by half as a result of heat treating the steel does not affect its plastic properties under complex loading conditions. (Q24, 2-64; AY)

1016-Q. (Russian.) **Problem of Changes of Intensity of X-Ray Lines During the Deformation of Polycrystals.** B. I. Smirnov. *Zhurnal Tekhnicheskoi Fiziki,* no. 1, 1957, p. 218-220.

Changes in intensity of X-ray diffraction lines were measured during the deformation of polycrystalline Armco Fe. Cylindrical specimens previously vacuum-annealed at 600° C. were deformed in compression perpendicular to the axis, in steps of a few per cent. After each step, X-ray exposures were made on the lateral surfaces of the specimens. The (110), (220), (211) and (220) lines were studied. The specimen was not rotated during the exposure, its axis being set perpendicular to the axis of rotation of the counter. (Q24, M22g; Fe)

1017-Q.* (Swedish.) **Veining in Ferrite.** A. Hultgren, A. Josefsson, E. Kula and G. Lagerberg. *Jernkontorets Annaler,* v. 142, no. 4, 1958, p. 165-202.

Deformation of hot worked steels. Veining or subboundary network showed greatest regularity of direction and was more closely meshed the higher the rate and the lower the temperature of deformation. Large grain size favored regular sub-boundaries. Three modes of etching of sub-boundaries, ridge veins, groove veins and level veins occurred together in a grain section under certain conditions, depending on orientation of section, carbon or nitrogen content and rate of cooling. Minimum amount of dissolved carbon or nitrogen was required for appearance of ridge vein; vein increased with an increase of these elements. Sub-boundaries in (100) sections always appear as groove veins. Level veining caused by differences in orientation between adjacent subgrains. 21 ref. (Q24, M26c, M27f, 2-60, 2-59, 3-68; CN-d)

1018-Q. Crack Propagation Tests of High-Strength Sheet Steels Using Small Specimens. J. E. Srawley and C. D. Beachem. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131682, Apr. 1958, 30 p. $1.

Test for high-strength sheet materials for current and projected rockets and high-speed aircraft provide a means of distinction between materials which could be expected to behave reliably in highly stressed structures and those which would be sensitive to minute stress-raisers. (Q26q, 1-54; ST, 4-53, SGB-a)

1019-Q. Cast Age-Hardenable Austenitic Steels. E. A. Lange, N. C. Howells and A. Bukowski. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131733, May 1958, 16 p. $.50.

Cr-Ni-P, Cr-Mn and Cr-Ni-Mn-V types of age hardenable, austenitic steels which have high strength in wrought forms were investigated for use as high-strength, nonmagnetic castings. A Cr-Ni-P austenitic steel with 0.3% C and 0.25% P developed yield strength at the 100,000-psi. level. The Cr-Mn austenitic steels containing phosphorus or vanadium were age hardenable, but castings of these alloys were brittle when heat treated to high strength. (Q27a; SS, 5-60; SGB-a)

1020-Q. (Russian.) **Creep of Aluminum Under Dynamic Loads.** A. A. Presvoditelev and B. A. Smirnov. *Vestnik Moskovskogo Universiteta,* no. 3, 1956, p. 51-55.

Creep tests of Al subjected to additional impact-pulsating loads. The load, produced by an eccentric mechanism, was applied to the lower jaw and the static load was applied to the upper one. Deformation was determined photographically using a system of mirrors. (Q3, 1-54, 1-53; Al)

1021-Q. Final Report—Development and Testing of Air-Melted Nickel-Molybdenum Alloys With Minor Alloying Additions. O. Preston, C. F. Floe and N. J. Grant. *U. S. Atomic Energy Commission ORNL-2520,* 1958, 41 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Stress-rupture, tensile and embrittlement testing of six 4800-lb. air-melted experimental heats of Ni-Mo alloys containing 13 to 20% Mo with additions of Mn, Fe, Si, Cr, Al, Ti, W, Cb and C. Results for commercial Hastelloy B included for purposes of comparison. Addition of minor alloy elements is effective in eliminating the embrittlement previously reported. (Q-general, Q26s, 2-60; Ni, Mo)

1022-Q. (Polish.) **On the Possibility of Replacing Long-Time Creep Tests by Short-Time Tests.** W. Tomaszczyk. *Hutnik,* v. 23, no. 12, 1956, p. 459-462.

Use of Larson-Miller method for determining service life of certain austenitic steels of Cr-Mo, Cr-Mo-V and Cr-Ni-W-Mo types. The constant C in the cases analyzed varies in the range 17-24. When the proper value is taken for C the steels analyzed obey the Larson-Miller relationship well for drops in temperature of up to 200° C. (Q3; AY)

1023-Q. (Russian.) **Mechanism of the Influence of Phosphous and Molybdenum Additions on Temper Brittleness of Steel.** V. I. Arkharov, S. I. Ivanovskaya, N. M. Kolesnikova and T. A. Fofanova. *Fizika Metallov i Metallovedeniye,* v. 2, no. 1, 1956, p. 57-65.

Specimens of Cr-Ni structural steel with normal and higher content of P (within its solubility limits) were heat treated to produce a brittle state. P content is substantially higher in the surface layer of brittle fracture than in that

obtained in impact fracture. Analogous results were obtained with steels of the same composition, but with Mo added.
(Q26s, 2-60; AY, *P, Mo*)

1024-Q. (Russian.) **Concerning the Additiveness of Mechanical Properties of Metallic Alloys and Mixtures.** Ye. M. Savitskiy and V. V. Baron. *Izvestiya Sektora Fizika Khimicheskogo Analiza IONKh Akademii Nauk SSSR*, v. 27, 1956, p. 86-96.

Using the systems Mg-Si, Mg-Ge, Cu-Si, Al-Cu, Ni-Si and Co-Si as examples, it is shown that the mechanical properties of two-phase metallic mixtures depend substantially on the mutual distribution of the structure of components in these mixtures. (Q-general, 3-71)

1025-Q. (Russian.) **Heat Resistance of Alloys of the Quaternary System Nickel - Chromium - Aluminum - Columbium.** I. I. Kornilov and L. I. Pryakhina. *Issledovaniya po Zharoprochnym Splavam. M., Akademii Nauk SSSR*, v. 27, 1956, p. 138-147.

The maximum heat resistance is produced by those compositions of quaternary alloys corresponding to the transition region from solid solutions to alloys having a heterogeneous structure. These alloys have a structure of saturated and supersaturated solid solutions with finely dispersed segregation of the excess phase. (Q-general, 2-62, M27; Ni, Cr, Al, Cb)

1026-Q. (Russian.) **Effect of Superheat Temperature and the Introduction of Magnesium on the Properties of Spheroidal Graphite Cast Iron.** E. E. Farafonov and M. S. Kolmakova. *Liteinoe Proizvodstvo*, no. 3, 1957, p. 14-16.

Low-temperature introduction of Mg and high temperature of superheat of the metal improves mechanical properties and quasi-isotropy of spheroidal graphite cast iron.
(Q-general, E25q; CI-r)

1027-Q.* (Russian.) **Effect of Steel Composition on Formation of Hot Cracks in Castings.** N. A. Trubitsyn and P. I. Bidulya. *Liteinoe Proizvodstvo*, June 1958, p. 22-26.

Study of microstructure of low-alloy steels with varying sulphur contents shows that, regardless of the steel's identical content of carbon and phosphorus, the greater the sulphur content the greater the tendency toward hot crack formation because sulphur increases nonmetallic inclusions in grain boundaries. The ratio of Mn to S does not alter these conclusions. 10 ref. (Q26q, 2-60; ST, *S*, 5-60, 9-69)

1028-Q. (Russian.) **Study of Impact Fatigue.** N. N. Davidenkov and E. I. Belyaeva. *Metallovedenie i Obrabotka Metallov*, v. 11, 1956, p. 4-10.

Static and impact fatigue was studied on specimens of steels KDLVT (cast) and U8 in the annealed condition, normalized steel 45Kh, fully tempered steels 45Kh, 30Khgsa, KDLVT (cast and forged), 55GS and U8. In the impact tests the strain rate was 10 times faster than in the static tests. The value of stress in the static tests was measured by means of the bending moment. The dynamic coefficient is 1.14.19 for steels in the annealed condition, 0.97-1.01 for the normalized and fully tempered conditions, 0.90-0.91 for the medium-tempered condition, and 0.80-0.91 for the low-temperature tempered condition. This descending order is explained by the part played in the hardening of the steel by carbide hardening which occurs less readily as the strain rate increases. 14 ref. (Q7, 1-54; ST)

1029-Q. (Russian.) **Relaxation of Oriented Micro-Stresses. Pt. 1.** B. M. Rovinskii and V. G. Liuttsau. *Zhurnal Tekhnicheskoi Fiziki*, no. 2, 1957, p. 345-350.

Investigated by studying the relaxation of elastic deformation of the lattice in metals under simple extension, using cylindrical test pieces of pure Al (99.99%) and Cu (99.92%) having a mean grain size of about 0.02 mm. (Al) and 0.05 mm. (Cu). Character of the relaxation processes in both micro and macrostresses is essentially identical. Both processes of relaxation are achieved basically as a result of elemental shifts in the crystal grains. (Q21, Q25; Al-a, Cu-a)

1030-Q. (Ukrainian.) **Effect of the Machining of Steel on Its Fatigue Strength.** G. V. Karpenko and A. I. Yatsyuk. *Dopovidi Akademii Nauk Ukrains'koi SSR*, v. 1, 1957, p. 23-26.

Effect of ordinary machine turning, heavy turning, grinding and roll-peening on fatigue strength of cylindrical specimens in steel U8A quenched to sorbite, normalized steel 45 and steel 20Kh. Heavy

turning lowers the fatigue strength in air and even more in water. Subsequent grinding to small tolerances does not remove the ill effects of heavy turning. Roll-peening considerably increases the fatigue strength after all forms of machining, but especially after heavy turning. (Q7a, G17, G23n; ST)

1031-Q. (Russian.) Intergranular Cracks in Steel Castings. D. K. Butakov. *Liteinoe Proizvodstvo*, June 1958, p. 20-22.

Steels with structurally free ferrites which are distributed on the surface of austenitic crystals have tendency to form cracks. 7 ref. (Q26p, M27; ST, 9-72)

1032-Q. A High-Temperature Vacuum and Controlled Environment Fatigue Tester. G. J. Danek, Jr., and M. R. Achter. Naval Research Laboratory. *U. S. Office of Technical Services*, PB 131737, May 1958, 12 p. $.50.

Equipment for reverse-bending fatigue tests at elevated temperatures in vacuum. Large strain amplitudes at low frequencies are used to produce failures in approximately 10^5 cycles. Equipment may be used for metallographic investigations of fatigue damage and crack initiation and growth at elevated temperatures. A major design problem, the transmission of motion through a vacuum seal, was circumvented by the use of a magnetic coupling driven at the resonant frequency of the specimen. (Q7, 1-53, 1-73)

1033-Q. Internal Friction in Deformed Alloys of Aluminum With Magnesium. A. V. Grin and V. A. Pavlov. *Physics of Metals and Metallography*, v. 4, no. 1, 1957, p. 81-87. (Translation by Pergamon Institute.)

Previously abstracted from original. See item 1057-Q, 1957. (Q22, 3-68; Al, Mg)

1034-Q. Investigation of the Deformation of Metals Under Small Stresses on Some Regularities of Creep in Copper and Aluminum. B Ya. Yampolski and T. A. Amfiteatrova. *Physics of Metals and Metallography*, v. 4, no. 1, 1958, p. 106-114. (Translation by Pergamon Institute.)

Previously abstracted from original. See item 1058-Q, 1957. (Q3; Al, Cu, 4-51)

1035-Q. Mechanism of Plastic Deformation, and Mechanical Properties, of Aluminum. Pt. 1. Study of the Mechanism of Plastic Deformation of Aluminum by Marks Arising on Its Surface During Extension. E. A. Iakovleva. *Physics of Metals and Metallography*, v. 4, no. 1, 1957, p. 115-120. (Translation by Pergamon Institute.)

Mechanism of plastic deformation of Al changes with the varying conditions of straining. Increase of temperature and decrease of speed of test influence the mechanism of deformation in the same direction Making use of a wide range of speeds of elongation made it possible to follow the transition from the displacement to the atomic diffusion mechanism of deformation at one and the same temperature, roughly 250° C. 9 ref. (Q24; Al)

1036-Q. Mechanism of Plastic Deformation and of the Mechanical Properties of Aluminum. Pt. 2. Formation of Blocks in the Grain of Aluminum During Plastic Deformation. E. S. Iakovleva. *Physics of Metals and Metallography*, v. 4, no. 1, 1957, p. 120-125. (Translation by Pergamon Institute.)

The size and degree of disoriented areas are unequal if the conditions of straining are different. At low temperatures these areas are weakly formed by disoriented blocks. The over-all angle of disorientation of the blocks at 2% elongation does not exceed 1°. With the increase of deformation the angle of disorientation increases and the block size decreases. 7 ref. (Q24; Al)

1037-Q. One Method of Determining Fracture Strength. L. M. Kachanov and A. L. Nemchinskii. *Physics of Metals and Metallography*, v. 4, no. 1, 1957, p. 125-132. (Translation by Pergamon Institute.)

Fracture strength of low-carbon steel depends essentially on the small degree of deformation before rupture. If the stressed condition is reinforced somewhat so that the deformation before rupture is, for example, 0.1% of the length, then the fracture strength of low-carbon steel with grain no. 2 is 1.5 times greater than the value established by testing the usual smooth fractured surfaces in nitrogen. 7 ref. (Q26r; CN-g)

1038-Q. Deformation Texture of Cold Rolling in Low-Carbon Steel. K. V. Grigorov and G. P. Blokhin.

Physics of Metals and Metallography, v. 4, no. 1, 1957, p. 133-139. (Translation by Pergamon Institute.)

Previously abstracted from original. See item 1060-Q, 1957. (Q24, M26c; CN-g)

1039-Q. Variation in Plasticity of Transformer Steel in the Process of Cooling. S. I. Doroshek, N. I. Lapkin and G. N. Shubin. *Physics of Metals and Metallography*, v. 4, no. 1, 1957, p. 140-143. (Translation by Pergamon Institute.)

Previously abstracted from original. See item 1061-Q, 1957 (Q23p, J23; ST, SGA-n)

1040-Q. (Bulgarian.) **Some Problems in the Technology of Producing Articles in Hadfield Manganese Steel.** Y. L. Dimitrov. *Tezhka Promishlennost*, v. 5, no. 12, 1956, p. 52-58.

Effects of chemical composition, production technology and heat treatment conditions on mechanical properties. The Mn:C ratio should be greater than 10, otherwise there will be a considerable amount of carbides in the steel. Reduction of carbon to 1% and lower impairs wear resistance. The optimum Si content is 0.6-0.5%. The cause of hot tearing and cold cracking is insufficient deoxidation. Homogenization at 1065° C. dissolves the carbides in solid solution. Heat treatment is best done in gas-fired holding furnaces. (Q-general, 2-60, 2-64; AY, *Mn*, SGA-m)

1041-Q. (Czech.) **Temperature Regulation During Long-Time Creep Testing.** B. Sestak. *Hutnicke Listy*, v. 12, no. 3, 1957, p. 202-206.

Review of existing thermo-regulators used for creep testing and two now types of dilatometric thermo-regulators for resistance furnaces and the necessary equipment. The proposed design has given completely satisfactory results (±1° C. temperature variation up to 700° C.). (Q3, X9, 1-53)

1042-Q.* (German.) **Tests on the Penetration Hardness and Grinding Hardness of Hard Metals.** P. Grodzinski. *Werkstattstechnik und Maschinenbau*, v. 48, July 1958, p. 364-372.

Tests performed with double-cone shaped penetration diamonds on hard materials such as diamonds, silicon carbide and different kinds of corundum, and tests with double-cone grinding stones of different materials on diamonds, silicon carbides, synthetic corundum and hard metals. Applicabilities of the method to ceramics, glazes, glass, hardened steel, pencil leads, abrasive disks, lubricants. (Q29c, 1-54)

1043-Q. (Polish.) **Preparation of Specimens and Tension Tests.** B. Otta and J. Teindl. *Hutnik*, v. 7, no. 1, 1957, p. 14-15.

Effects of filing and necking during a tension test on the elongation and tensile strength of metallic specimens. In cutting out a specimen for test, there is strain hardening at the point of cutting, so that the test yields an enhanced strength figure. Unfiled specimens have a tensile strength which is 6.6% higher than that of unfiled ones. Elongation can only be accurately determined when the tension test specimen fails in the middle. It was found that even a slight contraction greatly reduces elongation in tension tests. (Q27, 1-60)

1044-Q. (Polish.) **Hydrogen Corrosion of Steel and Procedures for Its Prevention (Hydrogen Brittleness of Steel).** Zabik Wladyslaw. *Przeglad Mechaniky*, v. 16, no. 2, 1957, p. 58-64.

Temperature has the greatest effect on diffusion of H and H embrittlement. Examples of embrittlement during acid pickling of Fe. Effect of composition of the scale on rate of evolution of H; effect of carbon content of the steel. Alloying of steel with Si, Cu and Ni does not increase its resistance to embrittlement; Mn, Mo and W have little effect, whereas Cr, V, Ta, Nb and especially Ti are effective. (Q26s, 2-60, 2-61; AY, *H*)

1045-Q. (Russian.) **Diagram of Composition Versus Refractoriness of Alloys of the Ternary System Nickel-Chromium-Titanium.** I. I. Kornilov and L. I. Pryakhina. *Izvestiya Akademii Nauk Otdelenie Tekhnicheskii Nauk*, no. 7, 1956, p. 103-110.

Hardness, electric resistivity, microstructure and refractory properties of the system Ni-Cr-Ti with constant Cr content (10% and 20%) and variable Ti content (from 0 to 15%). (Q29n, Q-general, 2-62; P15g, 2-60; Ni, Cr, Ti)

1046-Q. (Russian.) **Relation Between Composition, Temperature and Heat (Creep) Resistance. Pt. 3. Alloys of the Nickel-Chromium-Tungsten-Aluminum-Titanium System.** I. I. Kornilov and F. M. Titov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 10, 1956, p. 117-122.

Effect of Ti on the creep resistance between 600 and 1250° C. of nickel alloys with 20% Cr, 6% W, 4.5% Al; Ti content was changed from 0 to 10% by replacement of Ni. Solubility of Ti in the alloy solid solution was studied between 850 and 1180° C. by metallography, from the change in hardness during aging for 450 hr. at 850-950 and 1000° C. and by measurement of the lattice constant of the solid solution, and was found to be 4.5% at 1180° C., 1.5-2% at 1000-1100° C., and less than 1% at 800-900° C. and below.
(Q3m, 2-60; Ni-b, *Cr, W, Al, Ti*)

1047-Q. (Russian.) **Effect of Heat Treatment on Notch Sensitivity of Chromium-Molybdenum Steel.** Z. N. Petropavlovskaya. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 54-58. (Henry Brutcher, Altadena, Calif., Translation no. 4287.)

Heat treatment was shown to have special effect on notch sensitivity of Cr-Mo steel during tensile strength tests. By modifying heat treatment conditions the notch sensitivity and brittleness of this steel can be altered. For steels with composition of 1.5-2.5% Cr; 0.5-1% Mo and 0.2-0.5% V, it is recommended that a two-fold normalizing procedure take place, beginning at a high temperature (1040°), then a lowering to 960°, followed by annealing at 680°. 5 ref.
(Q23s, 2-64; AY, *Cr, Mo*)

1048-Q. (Russian.) **Effect of Temperature on the Shape of the Composition Versus Heat Resistance Curve.** M. V. Zakharov. *Sbornik Nauchnykh Trudov Moskovskogo Instituta Tsvetnykh Metallov i Zolota,* no. 25, 1955, p. 315-324.

Thirty-three copper alloys, containing small amounts of 14 different admixtures were investigated. Composition versus heat resistance diagrams (or composition versus prolonged hardness) experience a principal change with increasing temperature.
(Q-general, 2-60, 2-62; Cu-b)

1049-Q. (Russian.) **Procedure for Drawing the Strength Curves for High-Strength Steels Under Conditions of General Nonuniform Compression.** M. L. Gorb. *Sbornik Trudov Instituta Stroitel'noi Mekhaniki, Akademiia Nauk USSR,* no. 22, 1956, p. 35-55.

New procedure for dealing with experimental research data by deriving relationships from which strength curves can be drawn according to data of an indicator curve on compression (stress-deformation), strength curves for the ring and friction conditions at the ends. From a comparison of the strength curves for different systems of heat treatment it was found that cold working of ShKh15 steel after tempering (in liquid O_2, 15 min.) raises its resistance to relatively low elasto-plastic deformation and considerably lowers its capacity for increasing in strength on extensive plastic deformation.
(Q27a, Q24; ST)

1050-Q. (Russian.) **Effect of Work Hardening Edge Samples of Cold Rolled Transformer Steel on Its Electromagnetic Characteristics.** A. I. Belyakov. *Stal',* no. 2, 1957, p. 185-187.

As a result of heavy cold rolling of transformer steel the edge strips acquire high hardness which lowers its electromagnetic characteristics. To remove work hardening, annealing at 750-850° C. is helpful, since this lowers the specific losses by 15-20% and increases its magnetic induction by 100-400 gauss. Before using such annealing only 28% of samples from sheets 0.50 mm. thick (steel E330) and about 70% of samples from sheets 0.35 mm. thick satisfied normal standards; as after annealing, the quantity of samples which satisfied the standard increased to 98% for sheets 0.50 mm. thick and to 100% for 0.35 mm. thickness.
(Q23a, P16, 2-64; ST, SGA-n)

1051-Q. (Russian.) **Causes of the Unsatisfactory Ductility of Iron-Chromium-Aluminum Resistance Alloys.** A. P. Boiarinova and S. I. Malov. *Stal',* v. 17, no. 3, p. 280.

Presence of a large amount of alumina in Fe-Cr-Al resistance alloys of the 1Kh25Yu5 and OKh25Yu5 types is one reason for their unsatisfactory ductility. Having high hardness (600 BHN) alumina inclusions in drawing can cut the comparatively soft parent alloy (217 BHN) so that there are frequent breaks when wire of these alloys is drawn. To lower the amount

of alumina in such alloys 0.3-0.5% Ti or Zr is introduced. Nitrides formed by this treatment do not impair the ductility of the alloys in wiredrawing.
(Q23p, F28; Fe, Cr, Al)

1052-Q. (Russian.) **Study of Sheet Steel for Reservoir Tanks.** R. I. Duda, L. S. Livshits, V. D. Taran and A. S. Fal'kvich. *Stroitel'stvo Predpriyatii Neftyanoi Promyshlennosti,* no. 1, 1957, p. 13-16.

New method of testing steel to brittle destruction at low temperatures shows the high quality of steel MST. 3 of improved deoxidation and of low-alloy manganese steel. Other tests imitate the working of steel for tanks in the process of the deformation and breakdown caused by the rolls. Welded joints and areas around the joints in both steels have strength equal to that of the main body of the metal.
(Q27a, Q26s; ST, 4-53)

1053-Q. (Russian.) **Effect of Protective Coatings on the Fatigue Resistance of Steel 18 KhNVA.** G. V. Kurganov, A. S. Nikishov, L. P. Rink and N. I. Yartemskaya. *Tekhnologia Transportnogo Mashinostroenia,* no. 2, 1957, p. 29-32.

Chromium and phosphate coatings were tested at 450° C.; coatings of Zn, Cd, oxides and Sn at 250° C. Short trials to destruction and fatigue points were carried out at room and higher temperatures. Tinned test pieces show some loss of strength at 250° C. Electrolytic Cr plating of steel reduces its cyclical strength by 15-17%, both at room and higher temperatures.
(Q7a; AY, 8)

1054-Q. (Russian.) **Effect of Zirconium, Titanium and Aluminum on the "Pressure" Effect in Aluminum Alloys.** S. M. Voronov, V. M. Elagin and L. M. Gladshtein. *Trudy Moskovskogo Aviatsionnogo Tekhnologicheskogo Instituta,* no. 30, 1956, p. 36-59.

Pressure effect in an Al-Zr alloy, and the effects of Zr on the properties of the industrial alloy Avial (Al-Mg-Si); also effects of V and Ti. Seven alloys with 0.1-5% of Zr and V and five with 0.1-1.0% of Ti were prepared. Curves are plotted for the effects of Zr, V and Ti on the mechanical properties of Avial pressed, quenched from 490-530° C. and aged. It has been confirmed that the pressure effect can appear in Al alloys containing Zr, Ti and V, and that the pressure effect in Al-Zr alloys is due to the decomposition of a solid solution, formed in casting, during working the ingot.
(Q-general, 3-74, 2-60; Al-b, *Zr, Ti*)

1055-Q. (Russian.) **Effect of Small Amounts of Titanium and Vanadium on the Properties of Zinciferous Silumin.** G. I. Pogodin-Alekseev, N. A. Solov'ev and A. S. Broido. *Tsvetnye Metally,* no. 1, 1956, p. 66-72.

Presence of 0.1-0.2% Ti, V, Zr in Zn-containing silumin (Alpax) improves the mechanical properties and corrosion-resistance; alloy has good casting properties, and gives high resistance to impairment of its properties by long-period and cyclic heating. Effect of up to 0.7% Ti and V on the properties of Al-Zn-Si alloys containing up to 15% Si and 20% Zn. Metallographic study showed that up to 0.1% Ti and V refines the grain and increases the uniformity of eutectic distribution.
(Q-general, R-general, 2-60; Zn-b, *Ti, V, Zn*)

1056-Q. (Russian.) **Approximate Values for the Yield Point Rate Coefficient for Hot Worked Metals.** L. I. Perlin. *Tsvetnye Metally,* no. 8, 1956, p. 71-72.

To determine the rate coefficient which is a function of normal and tangential true stresses, use is made of the facts that the strain hardening of any metal is proportional to a fractional power of the strain; if hot working lasts long enough the tensile strength of the strain-hardened metal is about 2½ times that of the non-strain-hardened metal; recrystallization in which all lattice distortions are eliminated lasts up to 10 sec. A table of rate coefficients at the recrystallization temperature is given, with evaluations of the accuracy of analytical calculations of the working stresses. Calculated values of the yield points for repeated and continuous processes are reported. (Q23b)

1057-Q. (Russian.) **Determination of the Endurance of Steel Subjected to Repeated Tensile Shock.** L. T. Timoshuk. *Zavodskaya Laboratoriya,* v. 22, no. 12, 1956, p. 1487-1489.

To measure the force exerted on it during a tensile shock, the upper end of the specimen is allowed to act on a piezo-electric transducer,

whose signal at the moment of shock is recorded by a cathode-ray oscillograph. Steels 50 and 40Kh-NMA were subjected to repeated equal high tensile shocks and to alternating high and weak shocks. Steels having similar static mechancial characteristics may differ strongly in their reaction to repeated tensile shocks; repeated application of unequal tensile shocks increases the endurance of steel above that observed for repeated applications of the same high tensile shock X which can be regarded as caused by a "conditioning" of the steel by the intermediate low-value tensile shocks. (Q6p, Q27a; ST)

1058-Q. (Russian.) **Method of Determining Mechanical Properties of Metals in Torsion.** N. G. Mikhailichenko. *Zavodskaya Laboratoriya,* v. 23, no. 1, 1957, p. 83-87.

It is possible to determine all the principal mechanical properties of metals directly from automatically recorded torsion curves with an electrical method of strain measurement. Determination of proportionality limit, yield point and shear strength, and also relative and true shear. The lower peak on the curve of torque against relative twist angle depends little on the shape of the specimen and is a very important practical characteristic of the strength properties of a material. (Q1, 1-54)

1059-Q. Damping of Vibrations in Joints of Machine Parts. D. N. Reshetov and Z. M. Levina. *Vestnik Mashinostroeniya,* v. 36, no. 12, 1956, p. 3-13. (Henry Brutcher, Altadena, Calif., Translation no. 4238.)

(Q8, X28m)

1060-Q. Analysis and Application of Certain Creep Criteria. I. A. Oding and V. S. Ivanova. *Vestnik Mashinostroeniya,* v. 35, no. 5, 1955, p. 62-66. (Henry Brutcher, Altadena, Calif., Translation no. 4211.)

Previously abstracted from original. See item 652-Q, 1955. (Q3; ST)

1061-Q. Creep Ductility Criterion for Metals. V. S. Ivanova. *Zavodskaya Laboratoriya,* v. 21, no. 2, 1955, p. 212-216. (Henry Brutcher, Altadena, Calif., Translation no. 4210.)

(Q3)

1062-Q. (Russian.) **Computation of Diagrams for the True Strain of Cold Worked Metals.** G. P. Zaitsev. *Fizika Metallov i Metallovedenie,* v. 5, no. 3, 1957, p. 484-492.

7 ref. (Q25n, 3-68)

1063-Q. (Russian.) **Strengthening of Carbon Steel Wire Produced From Patented Billets.** K. D. Potemkin. *Stal',* v. 18, July 1958, p. 654-659.

Formula for determining tensile strength of wire subjected to deformation. 6 ref. (Q27a, 2-64; ST, 4-61)

1064-Q. (Book.) **Tentative Guide for Fatigue Testing and the Statistical Analysis of Fatigue Data.** 90 p. 1958. American Society for Testing Materials, Special Technical Publication, STP 9-A, 1916 Race St., Philadelphia 3, Pa. $3.75.

Definitions of statistical terms; purposes of fatigue tests; definitions of test procedures; selection of test specimens and analysis of fatigue data. (Q7, S12)

1065-Q.* Constitutional Factors Affecting the Tensile Properties of Wrought Aluminum-Magnesium-Silicon-Copper Alloys. D. L. W. Collins. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 325-336.

Tensile properties of solution treated and artificially aged alloys within the range 0.5 to 2.0% Mg, 0.3 to 1.2% Si and 0 to 1.5% Cu, related to equilibrium reactions at heat treatment temperatures. An isotherm for the Al-Mg-Si-Cu system at 520° C. is derived. Close correlation was found between mechanical properties and constitution, in particular the solid-solution composition when quenched. 18 ref. (Q27a, 2-60, 2-64; Al-b, *Mg, Si, Cu*)

1066-Q.* Ductile Fracture Instability in Shear. F. A. McClintock. *American Society of Mechanical Engineers, Paper no. 58-A-12,* 1958, 7 p.

Theory to predict when cracking will initiate from a notch at nominal shear stresses below the yield stress; when the crack will become unstable on increase of stress; when unstable cracking will occur if a notch is cut while a constant nominal stress is maintained. (Q25, Q2)

1067-Q.* A Theory of Elastic, Plastic, and Creep Deformation of an Initially Isotropic Material Showing Anisotropic Strain-Hardening, Creep Recovery, and Secondary Creep. J. F. Besseling. *American Society of Mechanical Engineers, Paper no. 58-APM-17,* 1958, 8 p.

If the condition is imposed that all subelements of an element of volume are subjected to the same total strain, it is demonstrated that the inelastic stress-strain relations of the material show anisotropic strain hardening, creep recovery and primary and secondary creep due to the nonuniform energy dissipation in deformation of the subelements. 10 ref. (Q3, Q21, Q24)

1068-Q. Prediction of Transition Temperature in a Notched Bar Impact Test. J. R. Hendrickson, D. S. Wood and D. S. Clark. *American Society for Metals, Transactions,* Preprint no. 96, 13 p.

Concepts of the mechanism of the initiation of brittle fracture in mild steel were previously developed employing notched tensile specimens subjected to rapid loading at different temperatures. These concepts are now applied to obtain a prediction of the transition temperature as determined in the standard Izod impact test. The predicted transition temperature is found to agree remarkably well with the experimental value. 13 ref.
(Q23r, Q26s, Q6; CN)

1069-Q. The Effect of Composition on the Hydrogen Embrittlement of Alpha-Beta Titanium Alloys. R. I. Jaffee and D. N. Williams. *American Society for Metals, Transactions,* Preprint no. 98, 21 p.

Variables investigated were kind and amount of beta stabilizer; combinations of beta stabilizers; presence of Al or Sn, and interstitial level. The susceptibility to hydrogen embrittlement decreased as the amount of beta stabilizer (per cent of beta) and Al increased, but became greater as the oxygen content increased. Mo was the most effective beta stabilizer, and Fe and Mn the least. 10 ref.
(Q26s, 2-60; Ti-b)

1070-Q. 5% Chromium Ultra-High Strength Steel. John C. Hamaker. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 1-15.

A 5% Cr air hardening steel appears to be the best presently available for either ultra-high strength applications at room or low temperatures, or for elevated-temperature stability to 1000° F. In the 220,000-300,000-psi. tensile range, this steel provides significantly higher impact strength and ductility than low-alloy steels, and 20-35% higher fatigue strength than any air melted material previously reported. From 400-1000° F., its strength-to-weight ratio surpasses all materials including heat treated Ti alloys. 17 ref.
(Q-general, T24; AY, *Cr,* SGB-a)

1071-Q. Embrittlement of High Strength Steels. E. P. Klier. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 53-67.

Over-all problem of fracture in high-strength steels consists in establishing the conditions under which critical-sized fracture nuclei are generated and the load conditions under which the nuclei are converted into free running cracks. It is possible that microstresses are important in determining nucleation of a crack depending on their sign. 15 ref.
(Q26s; ST, SGB-a)

1072-Q. Acceptance Testing of High Strength Steels. Seymour Goodman. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 69-76.

Four high-strength steels in widespread use are SAE 4340, SAE 4330, HS-220 and Hy-Tuf. Still higher strength steels have been developed, including Tricent, Super Tricent, U. S. S. Strux and Hi-C-Super Hy-Tuf. Tests outlined include creep, short-time hot tensile and stability tests. (Q27a, Q3, 1-54; AY, SGB-a)

1073-Q. Properties and Application of 17-7 PH and Other Precipitation Hardening Stainless Steel Sheet for Airframes. R. W. White. Paper from "Sheet Materials for High Temperature Service", American Society for Metals, 1958, p. 1-9.

Typical tensile strengths of the 17-7 PH, PH 15-7 Mo, and AM-350 in the subzero cooled and tempered conditions. The creep properties of PH 15-7 Mo are superior to those of the original composition. AM-355 also has superior creep strength to AM-350. Applications include stringers, ribs, bulkheads, shrouds, honeycombs and skins. 3 ref.
(Q-general, 17-57, T24a; SS)

1074-Q. High Alloys of Chromium, Cobalt, Columbium, Molybdenum and Vanadium. H. R. Ogden. Paper from "Sheet Materials for High Temperature Service", American Society for Metals, 1958, p. 11-23.

Presently available V-base alloys will be useful up to about 1300° F., Co-base alloys up to about 1800° F.,

and Mo-base alloys up to about 2200° F. The limited data on Cr-base alloys indicate that they should have structural strength up to about 1800-1900° F. Co exhibits useful strengths at temperatures at least to 1800° F. 29 ref.
(Q-general, 2-62; V, Co, Mo, Cb, Cr, 4-53)

1075-Q. Relationship Between Surface Condition, Friction and Wear. F. T. Barwell. Paper from "Effect of Surface on the Behaviour of Metals", Philosophical Library, 1958, p. 43-68.

Nature of friction or contact; effect of naturally occurring oxide films; effect of temperature; fretting corrosion; pitting-type failure; scuffing. Nature of the oxide film and its relationship to its substrate. 28 ref. (Q9, R1f)

1076-Q. The Effect of Copper, Nickel, Iron and Chromium on the Tensile Properties of Preferentially Oriented Beryllium Sheet. F. M. Yans, A. D. Donaldson and A. R. Kaufman. *U. S. Atomic Energy Commission, NMI-1192,* 1958, 41 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Beryllium was mixed with Cu, Ni, Fe and Cr to form binary alloys in powder form, then extruded and cross rolled. The effect of each alloying element was determined by tensile testing. In solid solution, small amounts of Fe and Ni had an embrittling effect, while Cu in solution increased the strength but had no effect on ductility. The effect of Cr was complicated and not readily explainable. 6 ref.
(Q27a, 2-60; Be, 4-53, *Cu, Ni, Fe, Cr*)

1077-Q. (Russian.) **Problem of Plastic Deformation and Strengthening in a Sign Reversing Deformation.** F. P. Rybalko. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 376-377.

Hollow single and polycrystalline cylinders of Cu, subjected to sign-reversing torsion in strictly symmetrical cycles, experience an unequally deformed plastic deformation, during which various parts of the specimen are deformed and strengthened not simultaneously, but in sequence. The distribution of deformation along the specimen was determined from the twist angles of scribe marks drawn before the test parallel to the generatrix of the cylinder, and also from the appearance of sharply bounded regions of different shade on the surface of the specimen. The cause of such a separation of cylinders into regions is in this case, the different degree of deformation and strengthening of the middle and extreme parts of the specimens. (Q1, Q24; Cu)

1078-Q. (Russian.) **Coefficient of Transverse Deformation in the Plastic Region.** A. V. Gur'ev. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 457-463.

Coefficient determined for structural steel. In plastic tension, even for a round specimen, the deformation occurs in an extremely irregular manner over its volume. Compared with other investigations, a value of the coefficient that is closer to 0.5 was obtained.
(Q24; ST, SGB-s)

1079-Q. (Russian.) **Structure of the Slippage Tracks on the Surface of Deformed Aluminum Alloys.** N. N. Buynov. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 477-483.

Electron microscope investigation of hardened Al-Cu (4% Cu), Al-Si (1.2% Si) and Al-Mg-Si (1.4% Mg_2Si) alloys. Each elementary slippage track corresponds to a slippage over a packet of atom planes. The shear over these planes is not distributed uniformly. The degree of localization of the deformation in the slippage tracks is different in different sections of the alloy.
(Q24c; Al-b)

1080-Q. (Russian.) **Problem of the Effect of Lubricating Media on the Process of Penetration of a Sharpened Indentor Into a Plastic Metal.** V. D. Kuznetsov and A. I. Loskutov. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 509-513.

Effect of lubricants on the measurement of microhardness of commercially pure Fe, Cu and Zn. Measurements were carried out dry and with vaseline (inactive media), and also in 0.2% solutions of olein and stearine acids in vaseline oil (active media). The loading range was from 20 g. to 4 kg. Curves of the "depth of indentor penetration versus load" were plotted for each medium. Curves without lubricant and with vaseline-oil lubricants are identical.
(Q29q; Fe, Cu, Zn, NM-h)

1081-Q. (Russian.) **Fragmentation of the Surface of Polycrystalline Metals in Sign-Reversing Torsion.** F. P. Rybalko. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 514-520.

Various frequencies of sign reversals in the deformation and deformation amplitudes per cycle have been employed. Many polycrystalline metals, such as Cu, brass, Al, Pb, Sn and Zn with their alloys with Al have been used to establish that in case of viscous failure, regardless of the frequency of sign reversal and of the value of the deformation amplitude during the cycle, the surface of the specimens is fragmented by macrocracks into a system of rectangular blocks, the sides of which are directed along the planes of the maximum cleavage stresses. (Q1, Q26n, Q24)

1082-Q. (Russian.) **Strengthening of Aluminum and Magnesium-Base Alloys by Triple Metallic Compounds.** B. K. Vul'f and N. P. Shekalov. *Izvestiia Sektora Fiziko Khimicheskogo Analiza Institut Obshchei i Neorganicheskoi Khimii imeni Akademii Nauk SSSR,* v. 27, 1956, p. 198-208.

Investigation of Al-Cu-Mg, Al-Mg-Zn, Al-Cu-Ni, Al-Cu-Mn, Al-Mn-Ni, Mg-Cu-Zn, Mg-Ca-Zn, Mg-Al-Li alloys. Addition of triple metallic compounds in cast Al and pressed Mg alloys increases their hardness and strength. Plasticity of the alloy diminishes with increasing content of the triple compound. In hard Ag or Mg the hardness of the heat treated alloys increases upon aging. Good mechanical properties were exhibited by alloys of Al with 7.5% Al-Cu-Mg. The greatest strength was obtained for a Mg alloy with 19.4% Al_2MgLi.
(Q27a, Q29n; Al-b, Mg-b)

1083-Q. (Russian.) **Effect of Alloying Elements on the Temper Brittleness of Structural Steels.** V. I. Prosvirin and Ye. I. Kvashinina. *Termicheskaya Obrabotka i Svoystva Litoy Stali. M., Mashgiz,* 1955, p. 69-87.

Addition of Mo up to 0.5% prevents development of processes that cause temper brittleness in structural Cr-Ni-Mo and Cr-Mn-Mo steels. Greater additions of Mo (1% and above) do not affect the temper brittleness. Addition of tungsten (up to 1.6% for the 35KhGV steel) strongly retards the development of temper brittleness in structural steels. Additions of Ti, V and Cb do not prevent the development of temper brittleness.
(Q26s, 2-60; AY, SGB-a)

1084-Q. (Russian.) **Causes of Large Plastic Deformations in the Stretching of Metal Samples With Annular Grooves.** Yu I. Likhachev. *Zhurnal Tekhnicheskoi Fiziki,* v. 26, no. 8, 1956, p. 1841-1848.

Investigation of the boundaries of plastic regions constructed as the first approximation of the elastic-solution method on the basis of the Neiber solution has shown that large plastic deformations appear long before fracture in the elasto-plastic deformation stage of grooved plastic metal samples, because the plastic deformation region penetrates to the axis of the sample on both sides of the smallest groove cross section, and a closed plastic region containing the elasto-deformed nucleus is formed. (Q24)

1085-Q. Material-Property-Design Criteria for Metals: Pt. 6. The Conventional Short-Time Elevated-Temperature Properties of Selected Light Alloys. W. P. Achbach, R. J. Favor and W. S. Hyler. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131515, Oct. 1957, 259 p. $6.

Data on alloys applicable to airframe and missile fabrication—2014-T4 and T-6; 2024-T3, T4, T6, T36, T81, and T86; 2218-T61; X2219-T6; 7075-T6 Al alloys; HK31A-T6 and HK31A-H24 Mg alloys; and Ti (8Mn) Ti alloy.
(Q-general, 2-62, T24; Al, Mg, Ti)

1086-Q. A Study of the Possibility of Reinforcing High-Temperature Alloys by Addition of Refractory Powders. J. D. Burney. P. R. Mallory & Co., Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131768, Feb. 1958, 48 p. $1.25.

Introduction of carbon to 80-20 Ni-Cr alloy forms a liquid phase in sintering which results in a high-density material having superior stress-rupture characteristics. Mere presence of carbon in the alloy does not insure the same increased stress-rupture properties. This indicates that the superior characteristics are indirectly due to a unique processing technique.
(Q3m, H12q; Ni, Cr, SGA-h)

1087-Q.* (French.) **Fatigue Testing of Welded Joints in Tubes and Plates.** W. Soete and J. Strebelle. *Revue de la Soudure,* v. 14, no. 2, 1958, p. 81-90.

Radiographic examination of a crane under construction was not

sufficient to determine quality of the welded joints, constructed from flattened tube ends and plates. Fatigue tests show that the repeated tensile strength of the assemblies was around 3.8 kg./per sq. mm. When a 1.5 security factor was used, the calculated compression did not exceed 2.53 kg./per sq. mm. Radiographic examination was restricted to detection of large imperfections. Weakness was primarily due to the unusual form of the piece. (Q7, S13e; ST, 7-51)

1088-Q. (Hungarian.) **Selection of the Proper Steel Type.** I. Mester. *Muszaki Elet,* v. 11, no. 8, 1956, p. 10-13.

Use of different types of steel and the effect of oxygen, nitrogen, hydrogen and alloying elements on properties. (Q-general, 17-57; ST)

1089-Q.* (Japanese.) **Hardness Tests.** Misao Mashimo. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 31-34.

Typical devices recommended by Japanese Industrial Standards. 4 ref. (Q29, 1-53; ST, 8-62)

1090-Q.* (Japanese.) **Case Hardness Tests.** Eiichi Takeuchi. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 35-38.

Physical methods are most efficient. Surface to be measured is prepared by polishing. Chemical methods are useful in measuring case depth. Microscopy is also helpful. (Q29, 1-54; ST, 2-64)

1091-Q. (Russian.) **Structural Features of Brittle and Viscous Fractures in Steel.** B. S. Kasalkin and B. A. Movchan. *Izvestiia Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 5, 1956, p. 151-153.

X-ray structural analysis method was used to study brittle and viscous fractures in specimens made of NL2 and BSt3 steel with a substantial difference in sensitivity and cold brittleness. X-rays indicate that in the case of viscous failure the degree of reduction of the initial grains on the fracture surface exceeded the degree of reduction in brittle failure. Propagation of plastic deformation under conditions of brittle damage is determined. Results confirm that in spite of the visible difference in the character of the fracture, brittle and viscous failure are accompanied by a process of breaking down of the initial grains and a strengthening that is characteristic of plastic deformation. (Q26s, 3-68)

1092-Q.* On the Orientation Effect in the Polygonization of Bent Silicon Crystals. F. L. Vogel. *Acta Metallurgica,* v. 6, Aug. 1958, p. 532-534.

Experiments show that polygonization can readily occur in regions of a bent crystal where the deformation is primarily by single slip. By contrast, when slip on intersecting systems allows the formation of Lomer-Cottrell barriers, polygonization is absent. Thus explicit experimental evidence for the formation and immobility of Lomer-Cottrell barriers is obtained. 5 ref. (Q24a, M26c; Si)

1093-Q.* Dislocation Theory of the Fracture of Crystals. F. E. Fujita. *Acta Metallurgica,* v. 6, Aug. 1958, p. 543-551.

Mechanism for fracture is calculated with the theory of dislocation in elasticity and strain energy method. The calculation shows that a long flat void packed with a certain number of dislocations will be able to grow to be a large crack causing fracture, even if it is sufficiently small to be a stable crack in the crystal—for instance, a few atomic spacings in thickness and a few hundred atomic spacings in length in one dimension. 14 ref. (Q26r, M26b)

1094-Q.* Properties of Some Tungsten and Titanium Steels Containing Boron. A. Banerjee, D. K. Sood and P. Mehta. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 143-160.

Effect of boron on the properties of low-carbon, low-alloy steels; influence of 0.5% Mo on steels containing 0.005% B; similarity in the effects of Mo, W and Ti in B treated steels; precipitation hardening in Mo-B steels; weldability of B steels. 25 ref. (Q-general, 2-60, K9s; AY, *Mo, W, Ti, B*)

1095-Q.* Temperature Dependence of Young's Modulus in Plain Carbon Steels. B. N. Das and S. K. Banerjee. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 195-206.

Young's modulus of plain carbon steels with up to 1% C at room temperature falls into a narrow range of approximately 30.4 to 30.7 $\times$ 10^6 psi. In general there

is a trend of gradual increase with increase in carbon content, but Mn seems to have a larger effect. 4 ref. (Q21a, 2-61; CN)

1096-Q.* Titanium at Temperature. H. R. Ogden. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. B2-B4.

Mechanical properties, thermal stability, oxidation and contamination resistance. (Q-general, 2-62; Ti)

1097-Q.* High-Strength Aluminum Alloy. Alan B. DeRoss. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. B6-B7.

Decrease in Fe content improves properties of Al casting alloy 356, permitting selection of a combination of properties suitable for structural parts. Q-general, 2-60; Al-b, SGB-a, SGB-s)

1098-Q.* Designing With PH Steels. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. B8-B11.

Applicable to 1200° F., precipitation hardening steels are affected by chemistry and heat treating variables. Brazing and welding precautions, mechanical and chemical properties. (Q-general, 17-51; SS)

1099-Q.* Ultra-Strength Steels. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. B13-B15.

Properties, composition, heat treatment, available forms, applications of AISI E 4340, AMS 6427 B, AMS 6428, Tricent, 5-317, Hy-Tuf, UHS 260, La Belle HT, HS 220, HS 260, Strux steels.
(Q-general, 17-57; AY, SGB-s)

1100-Q.* Pearlitic Malleable Castings. O. K. Hunsaker. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. D7.

Readily cast, easily machined, with 45,000 to 80,000 psi. yield strength and 60,000 to 100,000 psi. ultimate tensile strength, pearlitic malleable can be hardened to Rockwell C-62. (Q27a, Q29n; CI-s)

1101-Q.* (French.) **Low-Temperature Internal Pressure Tests on Tubular Specimens.** Alfred Krisch. *Revue de Metallurgie,* v. 55, June 1958, p. 555-561.

Internal pressure tests combined with longitudinal stress at temperatures of 20, -30 and -70° C. on tubular specimens in two basic bessemer steels of different N and Al contents in annealed and in artificially aged conditions. With lowering of temperature, both steels showed decrease in deformation upon fracture. Specimens with low N content stretched prior to breaking. Elastic limit and tensile strength increased at low temperatures. Tests gave evidence of sharp differences between steels tested when subjected to biaxial stresses. Results were compared with results of tensile tests on cylindrical specimens. 8 ref.
(Q21, Q27, Q10, 3-74; ST, *Al, N*)

1102-Q.* (French.) **Study of Laws of the Fatigue Process in Metals.** V. S. Ivanova. *Revue de Metallurgie,* v. 55, June 1958, p. 562-566.

Fatigue diagram is proposed according to which fatigue process is regarded as consisting of three periods: incubation, adaptation (during which slip occurs), and cracking. Method for experimental determination of length of each period permits construction of detailed fatigue diagrams of polycrystalline metals of polyhedric structure and establishment of laws of formation of cracks both within grain and at boundaries. For Armco Fe and Cu ratio of number of cycles causing appearance of adaptation (slip) lines within grains to number of cycles resulting in destruction of specimen has, for each metal, a constant value which is independent of stress. Diagrams for these two metals. 10 ref. (Q7; Fe, Cu)

1103-Q.* (French.) **Fatigue Phenomena During Combined Rolling and Slip.** A. G. Nikonoff. *Revue de Metallurgie,* v. 55, June 1958, p. 567-572.

Laboratory production of fatigue cracks and hardened layer that forms before appearance of cracks resulting from severe braking conditions in railroad car wheels. Fatigue tests on carbon and low-alloy steel specimens taken from wheels and treated by method described showed that the higher the mechanical properties, the finer the grain and the greater the quantity of lamellar structures in the metal, the slower is the formation of fatigue cracks. Increase in C content and proper heat treatment can provide these desirable properties. The hardest and most brittle surface layer forms on specimens with high carbon content, critical points at fairly low temperatures and low critical cooling rate. Mechanical properties do not appear to exert any great influence on cracks

caused by braking stresses. Low-carbon steel (to 0.6% C) or low-alloy steel with up to 0.5% C, suitably heat treated, is recommended for wheels subject to severe braking. 6 ref. (Q7, T23; ST)

1104-Q.* (French.) **Initial Results of Research on the Hot Deformation of Steels. Application of a Specially Designed Apparatus.** C. Rossard and P. Blain. *Revue de Metallurgie,* v. 55, June 1958, p. 573-594.

Results of hot torsion tests on several types of steel at speeds ranging from 1 to 1000 rpm. and temperatures of 900 to 1200° C. For a given speed of deformation and a given temperature, stress attains a constant value, independent of deformation, only after a transitory period of damped oscillations, this period being characteristic of the given steel. These transitory periods are associated with phenomena of recrystallization which give rise to very different structures according to speed of deformation and temperature. A law of variation of characteristic stress as a function of deformation and temperature is deduced. Test equipment described. 20 ref.
(Q1, 1-66, 1-53; ST)

1105-Q.* (French.) **Method of Graphical Determination of Transitory Phenomena During Hot Deformation of Steels.** C. Rossard and P. Blain. *Revue de Metallurgie,* v. 55, June 1958, p. 595-598.

Since in industrial processes correct rate of deformation often varies significantly with deformation, and since, for a given degree of deformation, stress under which hot deformation occurs depends not only on temperature, deformation and rate of deformation, but also on previous history of the metal, a method of graphical calculation is proposed which permits determination, on basis of a series of stress-deformation curves obtained at constant speed of stress variation as a function of deformation for any law of speed of deformation. 3 ref.
(Q24, 1-54, Q25n)

1106-Q. (Russian.) **Mechanism of Plastic Deformation and Mechanical Properties of Aluminum. Pt. 2. Block Formation in Grains of Aluminum During Plastic Deformation.** E. S. Yakovleva. *Fizika Metallov i Metallovedenie,* v. 4, no. 1, 1957, p. 145-150.

Disoriented regions are formed in the grains during plastic deformation. Size and degree of disorientation of the resultant regions are not the same, if the conditions of deformation of the specimens are different. At low temperatures, these regions are made up by weakly disoriented small blocks. The total angle of disorientation of the blocks at 2% tension does not exceed 1° C. As the deformation increases, the disorientation angle increases, and the size of the blocks decreases. At 18% tension, the size of the block reaches an order of 10^{-4} cm. (Q24, M26c; Al)

1107-Q. (Rumanian.) **Investigation of Properties of Low-Alloy Manganese-Molybdenum Structural Steel.** B. Rotenstein. *Studii si Cercetari Metalurgie,* v. 11, no. 2, 1956, p. 261-282.

Influence of Mn, Cr, Mo, Cu and C on tension properties, impact, subzero properties, hardenability, susceptibility to reversible temper brittleness, sensitivity to thermal welding cycle and corrosion stability. Low-alloy Mn-Mo steel with small additions of Cu and Si can be used to make machine parts as a substitute for Cr-Ni steels or Cr-Mo steels, and also for structural and shipbuilding material.
(Q-general, 2-60; AY, *Mn, Mo*)

1108-Q. (Russian.) **Brittleness of Chromium.** S. T. Kishkin and I. O. Panasyuk. *Doklady Akademii Nauk, SSSR,* v. 113, no. 6, 1957, p. 1263-1264.

Threshold of cold brittleness of Cr is substantially affected by various gases. Oxygen, both dissolved and bound, increases brittleness at normal temperature. The most harmful impurity among the elements that form solid solutions is nitrogen. Purification of the metal should lead to reduction in the cold brittleness.
(Q26s, 2-63, 3-69; Cr, *O, N*)

1109-Q. (Russian.) **Relaxation of Stresses in Alloys of Aluminum With Magnesium.** M. G. Gaydukov and U. A. Pavlov. *Fizika Metallov i Metallovedenie,* v. 4, no. 1, 1957, p. 123-130.

Relaxation of stresses in temperature range from 100 to 300° C. with initial stresses of 300 g. per sq. mm. Increase in the relaxation stability

of Al-Mg alloys, compared with pure Al is connected not with increase in the interatomic binding forces but with increase in the effectiveness of the binding forces. This is due to two factors; first, as the number of distortions increases, internal stresses are more uniformly distributed over the volume of the crystal; second, during diffusion, relaxation of stresses takes place near the regularities of the crystalline lattice, and a reduction in the degree of overstress takes place around them.
(Q3s, Q25h, M25h; Al-b, *Mg*)

1110-Q. (Russian.) **Concerning the Brittleness of Metal-Like Compounds.** V. S. Neshpor and G. V. Samsonov. *Fizika Metallov i Metallovedenie,* v. 4, no. 1, 1957, p. 181-183.

Coefficient of linear expansion of certain carbides, nitrides and borides of W, Mo, Ti and Zr determined, with their moduli of elasticity. On the basis of these quantities, the mean-squared displacements of the molecules of the corresponding compounds from their equilibrium positions in the crystalline lattice are calculated for the propagation of elastic waves. (Q26s, Q21, P10d; W, Mo, Ti, Zr, 14-68)

1111-Q.* Friction and Wear of Metals to 1000° C. E. P. Kingsbury and E. Rabinowicz. *American Society of Mechanical Engineers, Transactions,* Paper no. 58-LUB-6, 1958, 4 p.

Sliding experiments on Zn, Cu, Ti and 1020 steel carried out on a pin-on-disk friction apparatus incorporated in a metallurgical furnace. At room temperatures the results with steel, but not with the other metals, depended markedly on the atmospheric moisture content. As temperatures were raised to 400° C. the friction and wear rate of the steel reached a maximum at 100° C. and then diminished, while with the other metals the friction remained constant and the wear rate increased. 15 ref.
(Q9, 2-62; Zn, Cu, Ti, CN)

1112-Q.* Strength of Welded Joints in Low-Alloy Steels at Elevated Temperatures. W. B. Hoyt. *American Society of Mechanical Engineers,* Paper no. 58-PET-34, 1958, 15 p.

Short-time tensile and creep-rupture tests on steels with 1% Cr, ½% Mo, and 2¼% Cr, 1% Mo.
(Q27a, 2-62, Q3m; AY, *Cr, Mo,* 7-51)

1113-Q.* First All-Beta Titanium Alloy Has Strength of 240,000 Psi. *Materials in Design Engineering,* v. 48, Sept. 1958, p. 131-132, 134, 136.

Development by Crucible Steel Co. of three new high-strength Ti alloys. One, believed to be the first all-beta Ti alloy ever produced, can be heat treated to a tensile strength of 240,000 psi. and has excellent formability. The other two, available in sheet form, can be solution treated to a soft, easily formed condition and then aged to high room and elevated-temperature strength.
(Q27a, Q23q; Ti-b)

1114-Q.* High Strength Aluminum Alloy X357—Properties and Aging Practices. Alan B. DeRoss. *Modern Castings,* v. 34, Sept. 1958, p. 82-85.

Heat treating practices and mechanical properties; yield strength in the range of 43,000 psi. and ultimate strength above 50,000 psi. Exhibits castability, machinability, dimensional stability and corrosion resistance.
(Q-general, J27d; Al-b, 5-60)

1115-Q. Determination of the Mechanical Properties of Aircraft-Structural Materials at Very High Temperatures After Rapid Heating. J. B. Preston, W. P. Roe and J. R. Kattus. Southern Research Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131664, Jan. 1958, 206 p. $3.

Mechanical properties, tensile, creep, fracture, compression, shear and bending of several aircraft and missile structural materials under conditions of moderate to rapid rates of heating and of loading. Test materials included electrolytic tough-pitch Cu, oxygen-free high-conductivity Cu, A-nickel, ingot iron, Mo, Ta, Type-GBH graphite, and composite OFHC Cu plus 316 stainless steel sheet. Temperature ranges from room to the melting points of the metals and to 5750° F. for the graphite were used, with heating, holding, and loading times to failure ranging from 3 sec. to 30 min. The strength of the metals was found to decrease continuously with increasing temperature.
(Q-general, 2-62, T24, 17-57; Cu, Ni, Fe, Mo, Ta, SS)

1116-Q. Effect of Prior Creep on Mechanical Properties of Aircraft Structural Metals: 2024-T86 Aluminum and 17-7 PH Stainless. J. V. Gluck, H. R. Voorhees and J. W. Freeman. University of Michigan. (Wright Air Development Center.)

U. S. Office of Technical Services, PB 131716, Feb. 1958, p. 115 p. $2.50.

Specimens of 2024-T86 Al alloy and 17-7PH (TH 1050) precipitation hardening stainless steel were exposed for 10 to 100 hr. at stresses giving up to 3% total deformation, using temperatures of 350 to 500° F. for the 2024-T86 and 600 to 900° F. for the 17-7PH. Short-time tensile, compression or tension-impact tests were run at either room temperature, exposure temperature, or both. Results indicated that the short-time strength of structural materials may be raised or lowered. The changes in properties may be as much as 50% of the original value. (Q-general, Q3; Al-b, SS)

1117-Q. Studies and Comparison of the Properties of High-Temperature Alloys Melted and Precision Cast Both in Air and in Vacuum. M. J. Stutzman. Westinghouse Electric Corp. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131807, Mar. 1958, 112 p.

Potentialities for improvement of mechanical properties at elevated temperature of heat resisting alloys by varied practices of melting and investment casting. Two Co-base alloys, Stellite 31 and He 1049, and two Ni-base alloys, Udimet 500 and Guy's alloy, were tested. Effects of melting and casting procedures upon gas content (hydrogen, oxygen, oxygen and nitrogen), tensile properties at room and elevated temperatures, stress-rupture properties in the range 1350 to 1800° F., and oxidation resistance to air at constant temperature of 2000° F. and intermittent exposure to air at room temperature and 2000° F. (Q-general, 2-62, E10; Co, Ni)

1118-Q. Determination of the Mechanical Properties of a High Purity Lead and a 0.058% Copper-Lead Alloy. T. E. Tietz. Stanford Research Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131818, Apr. 1958, 43 p. $1.25.

Mechanical properties of a high-purity Pb and a 0.058% Cu-Pb alloy at test temperatures of 100, 175, 250 and 325° F. Tensile properties evaluated included ultimate strength, elongation, modulus of elasticity, proportional limit and yield strength. Compression properties studied were modulus of elasticity, proportional limit and yield strength. Ultimate shear strength and bearing yield strength and ultimate bearing strength were determined. Stress-creep time curves were obtained for total strain values of 0.2, 0.5, 1.0 and 2.0%, for creep times of from 1 to 500 hr. (Q-general; Pb)

1119-Q.* (Czech.) **Graphs for X-Ray Measurement of Internal Macrostrains.** Miroslav Cermak. *Hutnicke Listy,* v. 13, no. 7, 1958, p. 594-598.

Graphs for determination of internal macrostrain for usual types of back reflection method, especially flat conical and cylindrical cases. 5 ref. (Q25, M22g)

1120-Q.* (German.) **Properties of Zinc-Copper Alloys From Spelter 98.8.** E. Pelzel. *Metall,* v. 12, Aug. 1958, p. 732-735.

For cast alloys, Cu up to 8% is necessary to eliminate coarse grain caused by Pb impurities, and to obtain adequate mechanical properties. At best these alloys are inferior, and use in casting is probably limited. Used as a rolled material, Zn-Cu alloys of a lower Cu content can be given the desired mechanical and technological properties by adequate heat treatment. 10 ref. (Q-general; Zn-b, *Cu, Pb*)

1121-Q.* (German.) **Influence of Vanadium Upon Some Characteristic Properties of Cast Iron.** Gunter Meckler. *Stahl und Eisen,* v. 78, June 26, 1958, p. 900-906.

Vanadium seems to have considerable influence upon structures, tensile strength (up to 450° C.) Brinell and Shore hardness after casting and after annealing at 500 to 800° C. It increases surface hardness and tensile strength, also under elevated temperatures. The actual cause for these property changes is cementite which increases the effect of V. 12 ref. (Q-general; 2-60; CI-q, *V*)

1122-Q. (Russian.) **Softening of Plastically Deformed Metals.** V. N. Daniiov. *Metallovedenie i Obrabotka Metallov,* no. 6, 1957, p. 15-16.

Softening of plastically deformed low-carbon steels (0.03% C), Al and Cu, annealed at temperatures somewhat above the recrystallization temperature, rolled in the middle portion of each specimen and subjected to deformation under stresses of 3, 1.8 and 0.8 kg. per sq. mm. respectively. Value of the thermal emf. between the center and the rolled ends of the specimens and the microhardness in various points

were measured at different temperatures. The greater the deformation of the metal, the faster the softening process.

1123-Q.* (Russian.) **Relation Between Wear Resistance, Microhardness and Crystal Lattice Distortion of Metals.** Yu. S. Terminasov and P. I. Ignatenko. *Vestnik Mashinostroeniya,* v. 38, Aug. 1958, p. 45-46.

X-ray was used in studying physical aspects. Objects tested for wear resistance in dry state and in oil, using steel ring 48 mm. diameter. Graphic presentation of connection between the surface microhardness and deformation in the crystal lattice shows relationship to be rectilinear. Thus, the greater the distortions in the crystal lattice of the worked-in surfaces the higher its microhardness. (Q9n, Q29q, M26b)

1124-Q.* (Russian.) **Testing Armature Material by Resistance to Scratching.** A. V. Ratner and V. N. Gulyaev. *Zavodskaya Laboratoriya,* v. 24, June 1958, p. 770-774.

Tests applied to armatures working at steam pressure of 170-300 atm. and temperature of 560-650°. Test pieces are ground, flat objects approximating size of armature parts (diameter 20-100 mm.). Tests are conducted under steam (pressure about 1 atm.) with diminishing protective action of adsorptive layers and air. 4 ref. (Q29d, W11q)

1125-Q.* **High Temperature Mechanical Properties of the New Magnesium Alloys.** R. E. Bockrath. *Modern Metals,* v. 14, Sept. 1958, p. 52, 54, 56, 58.

Properties of sheet, plate, casting, extrusion alloys, including creep data up to 700-800° F.

1133-Q. (Russian.) **Device for Studying Metal Friction at High Temperatures.** L. M. Feigin. *Zavodskaya Laboratoriya,* v. 24, no. 7, 1958, p. 869-870.
(Q9p, 1-53, 2-62)

1134-Q. Cermets as Potential Materials for High-Temperature Service. O. A. Sandven. *Advisory Group for Aeronautical Research and Development,* Rept. 99, Apr. 1957, 6 p.

Review of chemical, physical and mechanical properties of the most important and promising hard metals and cermet systems, with special attention to creep resistance and ductility. Some experimental results on the system CbC-TiC-Ni. (Q-general, P-general; SGA-h, 6-70)

1135-Q. Mechanical and Engineering Properties of Commercially Available Titanium Alloys. *Advisory*

Group for Aeronautical Research and Development, Rept. 100, Apr. 1957, 4 p.

Titanium alloys being produced on a commercial basis up to early 1957. Nominal chemical compositions and manufacturer's designations. Collection of published data on physical, mechanical and engineering properties. Properties required by the aeronautical design engineer that are not available.
(Q-general, S22; Ti-b)

1136-Q. A Survey of the Structural Properties of Some High-Strength Sheet Steels. M. A. Melcon. *Advisory Group for Aeronautical Research and Development,* Rept. 101, Apr. 1957, 12 p.

Developmental of high-strength sheet steels for aircraft applications. Heat treatable stainless steels are 420, 422, 422M, AM350 and 17-7PH; Tri-cent is a low-alloy steel and Thermold "J" a toolsteel. Mechanical properties at room and elevated temperatures; fatigue, creep, and stress-rupture data. Fabrication problems such as welding, machining and distortion during heat treatment. (Q-general, T24, 17-57; AY, SS, SGB-a)

1137-Q. Croloy 15-15N—an Austenitic Heat-Resistant Alloy for Severe Tubular Applications at Elevated Temperatures. J. F. Ewing. *American Society of Mechanical Engineers,* Paper no. 57-A-205, Dec. 1957, 10 p.

Development work and extensive service experience for Croloy 15-15N, an austenitic heat resistant alloy designed with superior long-time strength at elevated temperatures for applications between 1200-1500° F. Strengths established in the 1200-1500° F. range are superior to the established AISI Type 300 series of austenitic heat resistant alloys. Need for proper heat treatment to realize superior strength above 1200° F. for Croloy 15-15N.
(Q27a, 2-62, Q3m, 2-64; SS, SGA-h)

1138-Q.* Relief of Thermal Stresses Through Creep. H. Poritsky and F. A. Fend. *American Society of Mechanical Engineers, Transactions,* Paper no. 58-A-41, 1958, 9 p.

Equations for analyzing effects of thermal creep on stress distributions. In formulating these elasto-plastic equations, the tensile test stress-strain creep data are extended to compound stresses by means of the Mises-Hencky hypothesis. The various equations are manipulated to yield a numerical procedure by means of which the stress and strain components are computed successively at the end of various time intervals. The resulting equations are applied to the axially symmetric problem of relief of thermal stresses in an infinitely long cylinder which is quickly heated to a parabolic temperature, and maintained at that temperature. (Q25p)

1139-Q.* How Radiation Damages Metals. M. J. Makin. *Atomics and Nuclear Energy,* v. 9, Sept. 1958, p. 318-322.

Effect of irradiation on tensile properties of a number of pure metals under various conditions. Very large increases in the yield strength have been observed in initially annealed materials and yield point phenomena have been found in irradiated Cu, Ni, Zr and Fe. The yield stress of pure metals shows only a slight temperature dependence before irradiation whereas, after irradiation, the yield stress is strongly temperature dependent, being much less at higher temperatures. 14 ref.
(Q27a, 2-67; Cu, Ni, Zr, Fe)

1140-Q.* Special Report on Temperature Resisting Mag-Thorium Alloy HK31. *Design News,* v. 13, Sept. 1, 1957, p. 18-19.

Hk31 contains 96.3% Mg, 3% Th and 0.5 to 0.7% Zr. It possesses extraordinary resistance to creep and maintains excellent strength through the temperature range of 300 to 700° F.
(Q3, Q27a, 2-62; Mg-b, *Th*)

1141-Q.* Measurement of Residual Stresses in Alloy Steel Forgings. A. Barker and E. H. Hardy. *Institution of Mechanical Engineers, Proceedings,* v. 171, 1957, p. 581-596.

Measurement by a trepanning method and by Sachs method. Possibility of plastic yielding during machining operations in the Sachs method and effect of this on the residual stress distribution in water quenched mild steel cylinders. Determination of residual stresses in an induction-hardened roll.
(Q25h, 1-54; AY, 4-51)

1142-Q. Creep Deflections and Stresses of Beam-Columns. T. H.

Lin. *Journal of Applied Mechanics,* v. 25, Mar. 1958, p. 75-78.

Calculation method for creep stresses and deflections, using integrating operators with Green's function to solve differential equation of equilibrium. Illustrative example is given for ideal H-section of 75S-T Al alloy, applying Shanley's creep hypothesis and his test data for 75S-T at 600° F. for constant stress within limited range (5000 ± 500 psi.) to varying stress over wider range (down to 750 psi.). Constant rate of deflection increase is shown for 1-10 hr. after loading.
(Q3, Q25; Al-b)

1143-Q. Stress-Raisers in Engineering Parts. (Digest of "Some Common Stress-Raisers in Engineering Parts".) G. A. Cottrell. Technical Report, British Engine, Boiler and Electrical Insurance Co., Ltd., New Series, v. 3, p. 91-112. *Metal Progress,* v. 74, Sept. 1958, p. 158, 160.

Stress-raisers of the same magnitude do not exert the same effect on different metals or even on different alloys of the same class. In general, most metals are notch sensitive, with the notable exception of cast iron and 18-8 stainless steel. Experiments have demonstrated that although the endurance limit of steel increases with tensile strength of unnotched specimens, it attains a maximum value of 160,000 psi. and then decreases with notched specimens.
(Q23s, Q25; ST, CI, SS)

1144-Q.* Cast Age-Hardenable Austentic Steels. E. A. Lange, N. C. Howells and A. Bukowski. *Modern Castings,* v. 34, Oct. 1958, p. 53-59.

Cr-Ni-P, Cr-Mn, and Cr-Ni-Mn-V steels for high-strength, nonmagnetic castings. Cr-Ni-P austenitic steel deyeloped 100,000-psi. yield strength. Cr-Mn austenitic steels were brittle when heat treated to high strength. Modifying the Cr-Ni-Mn-V composition resulted in an alloy with good ductility and 100,000-psi. yield strength. A fourth type of age-hardenable austenitic steel, Mn-V, containing a minimum of alloying elements was developed. 4 ref. (Q27, Q23, 2-60; SGB-a, SS, *Cr, Mn, Ni, V*)

1145-Q. Investigation of the Compressive Strength and Creep of 7075-T6 Aluminum-Alloy Plates at Elevated Temperatures. W. D. Deveikis. *National Advisory Committee for Aeronautics,* TN 4111, Nov. 1957, 28 p.

Elevated-temperature compressive strength from room temperature to 600° F. and creep test results from 350 to 500° F. for V-groove edge-supported plates of 7075-T6 Al alloy. Test results are analyzed to verify procedures for estimating maximum strength for material stress-strain curves and creep-failure stresses from isochronous stress-strain curves. Strength and creep results are also compared with similar results for 2024-T3 plates.
(Q28g, Q3m; Al-b, 4-53)

1146-Q.* Internal-Friction Study of Aluminum Alloy Containing 4 Weight Percent Copper. B. S. Berry and A. S. Nowick. *National Advisory Committee for Aeronautics,* TN 4225, Aug. 1958, 88 p.

Low-frequency internal friction measurements in both torsional and flexural vibration during aging. Both polycrystalline and single-crystal specimens exhibit an initial internal friction peak at 173° C. (for a frequency of 1 cps.) after solution treatment and quenching. This peak shows all the characteristics of a Zener relaxation, including strong anisotropy. It falls on aging in a manner simply related to the decrease in the Cu concentration of the matrix. This peak is also sensitive to the reversion of Guinier-Preston zones. (Q22; Al-b, *Cu*)

1147-Q.* Some Observations Relating to Recovery of Internal Friction During Fatigue of Aluminum. S. R. Valluri. *National Advisory Committee for Aeronautics,* TN 4371, Sept. 1958, 30 p.

Effective heat of activation for the process is approximately 10,000 cal. per g. mol. Variation of recovery with stress level and history indicates that recovery becomes independent of stressing history more quickly at higher stress levels. This recovery may be associated with the establishment of a subgrain structure and the basic process then happening may be one of indefinite to-and-fro motion of some free dislocations within the subgrains.
(Q22, Q7; Al)

1148-Q.* Creep of Nickel, Copper, and Nickel-Coppér Alloys. *National Bureau of Standards, Technical News Bulletin,* v. 42, Sept. 1958, p. 176, 177.

Tests were made at temperatures of 300°, 700° and 900° F. on initially annealed specimens of the two metals, and on a 70-30 Ni-Cu alloy, and

a 30-70 Ni-Cu alloy. Data derived from tests made at 700 and 900° F. indicate that the 30% Cu alloy was far more creep resistant than the 70% Cu alloy, regardless of the time under stress. The strengthening effects of alloying were more pronounced as the time of stress was increased and the temperature decreased. These observations were confirmed when the two alloys were tested at 1200° F. (Q3, 2-60; Ni, Cu)

1149-Q.* The Generation of Dislocations by Thermal Stresses. P. Penning. *Philips Technical Review,* v. 19, 1957-1958, p. 357-364.

During the pulling of Ge and Si crystals from the melt, a process widely employed in practice, a non-uniform temperature gradient arises. As a result, thermal stresses are formed in the material which may cause plastic flow or even fracture. Experiments on influence of rate of cooling a Ge rod on the state of internal perfection of the material. (Q25p, N3r; Ge, Si)

1150-Q.* High Silicon Additions Are Giving Aluminum Better Wear Properties. Richard M. Smith. *SAE Journal,* v. 66, Sept. 1958, p. 48-50.

Good wear properties and light weight of hypereutectic Al-Si alloys (greater than 11.6% Si) make it a likely candidate for pistons, cylinder liners, rocker arms, cylinder blocks and heads and brake drums. Effect and usefulness of phosphorus additions in controlling the size and dispersion of primary Si crystals. Q9n, T21b, T21c, 17-57; Al-b, *Si*)

1151-Q. Interim Report on Creep Behavior of Zircaloy-2 and Zircaloy-3. W. D. McMullen. Westinghouse Electric Corp., Bettis Plant, Pittsburgh. *U. S. Atomic Energy Commission WAPD-TM-132,* Apr. 1958, 20 p.

Zircaloy-2 was found to have much better creep properties than Zircaloy-3 even though their tensile properties are quite similar. The difference was magnified at lower second stage creep rates and/or higher temperatures. Creep of Zr and the Zircaloys tends to follow theoretical high-temperature creep behavior in agreement with the temperature dependence of other mechanical properties of Zr. 20 ref. (Q3; Zr-b)

1152-Q. Iron-Chromium-Aluminum Alloys. J. E. Srawley. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131676, Apr. 1958, 20 p. $.50.

Alloys containing up to 25% Cr and 11% Al produced by vacuum melting and hot worked by forging. Tensile properties at room and elevated temperatures were determined, and their resistance to oxidation in air and attack by the combustion products of residual fuel oils was studied.
(Q27a, 2-61, R1h, R7d; Fe, Cr, Al)

1153-Q. Static Strength of Cross-Grain 7075-T6 Aluminum Alloy Extruded Bar Containing Fatigue Cracks. Walter Illg and Arthur J. McEvily, Jr. *National Advisory Committee for Aeronautics,* TN 3994, Apr. 1957, 25 p.

Specimens were subjected to static tests to determine residual static strength. Small cracks resulted in disproportionately large reductions of static strength. Effects of biaxiality and ductility on notch sensitivity under static loading.
(Q27a, Q23s, 9-22; Al-b)

1154-Q. Effect of Cold Work on the Creep-Rupture Properties of a Series of Simple 18-8 Type Stainless Steels. Frank B. Cuff, Jr. and Nicholas J. Grant. Massachuetts Institute of Technology. *U. S. Office of Technical Services,* PB 127194, Feb. 1956, 37 p. (Available at Library of Congress, Washington, D. C. Microfilm $3, Photostats $6.30.)

Effect of cold work on the creep-rupture properties of a series of six simple 18-8 type stainless steels at 1100 and 1200° F. Compositional variation (15.7 to 21.8% Cr, 8.7 to 13.9% Ni and .042 to .075% C plus N) resulted in a M_s temperature variation from + 100° F. to absolute zero. A relationship was found among the compoistion, M_s temperature, recrystallization temperature and rupture-life. (Q3m, 3-68; SS)

1155-Q.* (German.) Investigation on the Grain Boundary Embrittlement of Complicated Die Forgings Made of AlZnCuMg.5. Wilhelm Rosenkranz. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 316-323.

On die forged pieces from this and other Al alloys intercrystalline fractures were observed along grain boundaries which resulted from varying deposits along these boundaries. These fractures were attributed to spontaneous recrystalli-

zation during deformation, which can be avoided through the addition of Fe, Mn and Cr. 8 ref.
(Q26s, N5, 2-60; Al-b, 4-51)

1156-Q.* Nuclear Radiation Effects on Materials. Gerald Reinsmith. *ASTM Bulletin,* no. 232, Sept. 1958, p. 37-47.

Effect on plain carbon steel, stainless steels, Ni, Zr, and Co alloys, as well as on several nonmetals. Sources of radiation, uses. 43 ref. (Q-general, 2-67; CN, SS, Ni, Zr, Co)

1157-Q.* A New Approach to the Problem of Creep. J. Glen. *Iron and Steel Institute, Journal,* v. 189, Aug. 1958, p. 333-343.

Creep data are plotted in the form of log strain, log creep rate curves (strain rate curves) to show transitions in creep rate in their true perspective. A family of such curves either at constant stress or at constant temperature form a regular pattern so that strain rate curves of tests at lower stress or temperature can be estimated. Ordinary strain-time-creep curves can be obtained by integration. This enabled accurate extrapolation of creep for rupture tests. Results of tests on several Mn steels used to illustrate creep transition phenomena and extrapolation of creep curves. 12 ref. (Q3, Q25n; ST)

1158-Q.* Vickers-Knoop Hardness Conversion. Lloyd Emond. *Metal Progress,* v. 74, Sept. 1958, p. 97.

Tests to determine relationships between Vickers diamond pyramid hardness (DPH) numbers and Knoop hardness at lighter loads than the standard 500 g. Three types of material were used—a low-carbon steel (A 212), a high-carbon steel drill rod and Monel metal. (Q29e; CN, Ni-b)

1159-Q.* Tap the Reserve Strength in Metal Parts. Dominic J. Graziano. *Product Engineering,* v. 40, Sept. 29, 1958, p. 44-47.

Equations and simplified design curves that will predict the maximum stress, moment and permanent deformation involved when pushing past the yield strength of a material under pure bending loads.
(Q25, Q5, T24, 17-51)

1160-Q. The Strengthening Effect of Beryllium on Zircaloy-3. R. E. Johnson and A. F. Steeves. Westinghouse Electric Corp., Bettis Plant, Pittsburgh. *U. S. Atomic Energy Commission, WAPD-TM-81,* Aug. 16, 1957, 25 p.

Ingots of Zircaloy-3 with 0.05, 0.15, 0.35 and 0.70% Be were melted by a double-consumable-electro-arc-melting process. Tensile strength increased with increasing Be content. After extruding and forging, the alloys showed considerably better properties than either Zircaloy-2 or 3. Hot tensile data indicated that the loss of strength with increasing temperature is not so great as that in the unmodified Zircaloys. 4 ref. (Q27a, 2-60; Zr-b, *Be*)

1161-Q. Phenomenological Relation Between Stress, Strain Rate and Temperature for Metals at Elevated Temperatures. Elbridge Z. Stowell. *U. S. National Advisory Committee for Aeronautics,* TN 4000, May 1957, 19 p. (Available at National Advisory Committee for Aeronautics, 1512 "H" St., N.W., Washington 25, D. C.)

Phenomenological relation suggested to account for the behavior of polycrystalline metals above the equicohesive temperature. The properties of the metal included in the relation are elasticity, linear thermal expansion and viscosity. The relation may be integrated under various conditions to provide information on creep rates, creep rupture, stress-strain curves, and rapid-heating curves.
(Q25n, Q21, P10f, P11g, 2-62)

1162-Q. Recovery of Embrittled Cadmium Plated Steel. H. H. Johnson, E. J. Schneider and A. R. Troiano. Case Institute of Technology. *U. S. Office of Technical Services,* PB 131654, Dec. 1957, 23 p. $.75.

Cadmium electroplate thickness influences the recovery rate of hydrogen-embrittled steel; the recovery rate decreases with increasing plate thickness. New and efficient technique for minimizing hydrogen embrittlement. (Q26s; ST, *Cd,* 8-12)

1163-Q. The Effect of Heat Treatment on the Stability and Creep Resistance of a Ti-Al-Mo Alloy. H. L. Gegel. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131673, Jan. 1958, 24 p. $.75.

Ti-Al-Mo alloys heat treated to high strength have good stability

and improved creep properties. Tests indicate that the stability of the alloy is inocuous and that transformation during testing helps to maintain the material strength. Mechanism of embrittlement by heat treatment.
(Q3, Q26s, 2-64; Ti-b, *Al, Mo*)

1164-Q. Theory of Creep of Dispersion-Hardened Alloys. J. Weertman. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131675, Apr. 1958, 11 p. $.50.

Creep equations derived for dispersion-hardened alloys. Following Schoeck, it is assumed that the rate-controlling process is the climb of dislocations over second-phase particles. At low stresses a first-power stress dependence is found; at intermediate stresses a fourth-power dependence; and at high stresses an exponential stress dependence. (Q3)

1165-Q. Tensile Properties of Inconel and RS-120 Titanium-Alloy Sheet Under Rapid-Heating and Constant-Temperature Conditions. George J. Heimerl, Ivo M. Kurg and John E. Inge. *National Advisory Committee for Aeronautics,* TN3731, July 1956, 29 p.

Rapid heating tests to determine the tensile strength of Inconel and RS-120 Ti alloy sheet heated to failure at uniform temperature rates from 0.2 to 100° F. per sec. under constant load conditions. Yield and rupture stresses obtained by rapid heating compared with yield and ultimate stresses from elevated-temperature tensile stress-strain tests for ½-hr. exposure. Applicability of master curves and temperature-rate parameters to the prediction of yield and rupture stresses and temperatures under rapid-heating conditions. (Q27a, 2-61; Ni-b, Ti-b, 4-53)

1166-Q. Effect of Atmosphere on Creep-Rupture Properties of a Nickel-Chromium-Aluminum Alloy. P. Shahinian and M. R. Achter. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131735, May 1958, 15 p. $.50.

Role of ductility in the effect of environment on creep and rupture properties was investigated employing a 76 Ni, 19 Cr, 4 Al alloy. Creep-rupture tests were conducted in air and in vacuum at 1300, 1500 and 1900° F. At low temperatures and high stresses, time-to-rupture was longer in vacuum than in air, but at high temperatures and low stresses the reverse was true.
(Q3m, 2-66; Ni-b, *Cr, Al*)

1167-Q. Metallurgical and Mechanical Characteristics of High-Purity Titanium Base Alloys. F. C. Holden, J. A. Houck, H. R. Ogden and R. I. Jaffee. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131817, Apr. 1958, 120 p. $2.75.

Relationships between thermal history, microstructure and mechanical properties for high-purity Ti-base alloys: Ti-Al-Mo, Ti-O-Mo, Ti-O-Al-Mo, Ti-C-Mo, Ti-O-Mn, Ti-O-Cu, Ti-C-Cu and Ti-Cu-Mn. Mechanical test data include tensile and flow properties, impact behavior over a range of temperatures, hardness, aging, and cooling-rate test data. Basic physical metallurgical principles involved.
(Q-general; Ti-b)

1168-Q. A Summary of Compressive-Creep Characteristics of Metal Columns at Elevated Temperatures. R. L. Carlson and G. K. Manning. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131825, Apr. 1958, 62 p. $1.75.

Study of the creep buckling of metal columns prior to collapse and at time of buckling. Solutions to creep buckling. Shanley's time-dependent tangent-modulus method has several practical advantages over other analytical solutions.
(Q3c, 2-62)

1169-Q. Effect of Prior Creep on Mechanical Properties of Aircraft Structural Metals. Pt. 2. 17-7PH Alloy (TH 1050 Condition). J. V. Gluck, H. R. Voorhees and J. W. Freeman. University of Michigan. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131826, Apr. 1958, 100 p. $2.50.

Little change in mechanical properties of 17-7PH (TH condition) stainless steel sheet results from exposure to creep at 600 to 900° F. Exposures were conducted for 10, 50 or 100 hr. either unstressed or at stresses giving up to 3% total deformation. Exposure at 800 and 900° F. had relatively little effect on mechanical properties. Changes that did occur were generally an increase in properties, and no loss was noted in any case.
(Q3, Q-general; SS)

1170-Q.* (English.) **Tests to Determine the Influence of Building up With Low-Hydrogen Electrodes on the Fatigue Strength of Medium-Carbon Steel Shafts.** *Lastechniek,* v. 24, July 1958, p. 158-159.

Results of rotating bend tests on medium-carbon steel shafts with one layer of weld deposit indicates that an endurance limit of about 70% of the limit of unwelded material can be reached. (Q7a, L24; CN-p)

1171-Q.* (English.) **On the Mechanism of Wear Between Metal Surfaces.** G. Yoshimoto and T. Tsukizoe. *Wear,* v. 1, June 1958, p. 472-490.

Analysis of the mechanism of wear between metal surfaces dependent on distribution of real area of contact. Assumption of a simple model which represents profile curves of a metal surface allows theoretical deduction of relationships between applied load in the number or size of the individual areas. Further assumptions as to the nature of the sliding process enable deduction of three types of wear for steel or cast iron: mechanical wear, Fe_2O_3 film wear and Fe_3O_4 film wear. These theoretical conclusions form basis for discussion of relationships of velocity and load to wear. 13 ref. (Q9)

1172-Q.* (English.) **A Simple Apparatus for Studying the Wear of Tungsten Carbide.** J. Golden and G. W. Rowe. *Wear,* v. 1, June 1958, p. 491-498.

Apparatus for testing transfer of radioactive tungsten carbide to steel or Cu during moderate speed sliding under various conditions. Wear track forms a close spiral about 20 ft. long. Zones of metal plate can be treated differently and effects on transfer of active slider can be studied in detail from autoradiographs. 5 ref. (Q9, 1-53; W, 6-69)

1173-Q.* (German.) **Hot Shortness and Grain Boundary Structure of Steel.** Friedrich Erdmann-Jesnitzer and W. Bernhardt. *Archiv für das Eisenhüttenwesen,* v. 29, June 1958, p. 353-357.

On sulphur-containing steel at temperatures around 1000° C., an increased susceptibility toward hot fracture along grain boundaries was observed. This is attributed to a eutectic of iron and iron sulphide. Armco iron was subjected to critical stretching after recrystallization, annealing and sulphurizing of surface, then the specimens were annealed at 659° C. for 8 to 48 hr. After etching the orientation angles between crystallites were determined. It was found that sulphur diffuses preferably into grain boundaries, where the angle of disorientation is about 18° C. 21 ref. (Q26, 2-62, M27c; ST)

1174-Q.* (German.) **Investigation on the Deformation Process of Iron-Silicon Alloys in Relation to Composition and Temperature.** Franz Lihl and Eduard Buhl. *Archiv für das Eisenhüttenwesen,* v. 29, June 1958, p. 365-375.

A number of Fe-Si alloys (1.0% to 6.1% Si) were subjected to extensive mechanical tests. Influence of pre-annealing upon the curve in the notched bar impact strength temperature diagram between −100 up to 1000° C. was determined. Also the curve for tensile strength, fracture elongation and notched bar impact strength in relation to temperature was investigated for alloys between 4.5 and 5% Si. 12 ref. (Q-general, 2-60, 2-61; Fe, *Si*)

1175-Q.* (German.) **Applicability of the Fatigue Strength Theory of F. Stuessi Upon the Results Obtained From Long-Time Fatigue Tests.** Werner Stauffer and Alfred Keller. *Archiv für das Eisenhüttenwesen,* v. 29, July 1958, p. 411-414.

A three-dimensional diagram for the endurance limits is established from mean stress, stress amplitudes and the logarithm of the number of cycles. Also the equation for the Wochler diagram is developed. These theories then are applied to endurance test results on a carbon steel and eight alloyed high-temperature steels. 7 ref. (Q7; CN, SS, SGA-h)

1176-Q.* (German.) **Heat Treatable Hot Working Steels: Mechanical Properties at Elevated Temperatures.** Karl Bungardt and Otto Mulders. *Stahl und Eisen,* v. 78, Aug. 7, 1958, p. 1119-1126.

Influence of different tempering and testing temperatures on mechanical properties (P) of steels. Behavior varies according to formula $P = T o_k(19 + \log t)$ where T = annealing temperature in °K, t = annealing time in hours. Tensile strength and 0.2% elongation limit decrease with tempering. Elongation and reduction of area are more irregular depending on steel composition. Materials with high retention of hardness and high resistance to

heat show range of brittleness; with lower heat resistance and hardness retension plasticity increases steadily with testing temperature.
(Q-general, 2-62; ST)

1177-Q.* (German.) **Influence of Hydrostatic Pressure Upon Stress Deformation of Single Crystals.** Peter Haasen and Andrew W. Lawson, Jr. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 280-291.

Influence of 5000 atm. hydrostatic pressure on stress-strain diagram of single crystals of Al, Cu, Ni, alpha-brass and polycrystalline Ni. The yield point was elevated in all cases, except on Ni single crystals, beyond the pressure coefficient of the modulus of elasticity. The crystal is work-hardened under pressure of 1 atm., which is indicated through an increase of yield stresses. 33 ref.
(Q27, 3-74; Al, Cu, Ni, 14-61)

1178-Q.* (German.) **Lattice Deformation and Residual Strains in Pure and Alloyed Aluminum Specimens After Stress Deformation.** Eckard Macherauch and Paul Müller. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 324-331.

X-ray investigations were made on polycrystals of pure and alloyed Al (duralumin) after plastic deformation and measurements of residual strains were compared to theoretical residual lattice strains. The theory of G. B. Greenough was not verified. Rather a characteristic compression state of the first degree was found. The diagram of residual stresses in relation to plastic deformation had the same shape as the stress-strain diagram reduced by the factor 0.4. 26 ref.
(Q25h, Q24, M26; Al)

1179-Q.* (Russian.) **Embrittlement of 20KhN14S2 Steel During Aging at 500-650°.** A. V. Tikhomirov, N. V. Sukhobokova and N. A. Tikhomirova. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 22-25. (Henry Brutcher, Altadena, Calif., Translation no. 4316.)

Investigation of austenitic stainless steel used in electric power construction which shows tendency toward intercrystalline corrosion and brittleness. Aging of steel at intervals of 500-650° C. shows tendency to brittleness with a lowering of plasticity and impact strength. The sharpest drop in impact strength takes place during first period of aging (i.e., the first 200-300 hr.). On further exposure impact strength decreases more slowly. Stabilization after tempering has no effect on aging process.
(Q26s, Q6n, R2h; SS-e)

1180-Q.* (Russian.) **Study of Action of Superheated Steam on the Rupture Strength of Austenitic Steel.** E. A. Davidovskaya and L. P. Kestel'. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 29-33. (Henry Brutcher, Altadena, Calif., Translation no. 4318.)

Steel tube 102 to 68 mm. diameter tested at 600°. Superheated clean steam without salt admixture does not lower strength of steel at high temperatures. However, presence of different types of salt has effect on walls of steampipes and lowers their strength when subject to great stress. It is therefore important to guard against any salt admixtures in steam used in boilers.
(Q27a, 1-66; SS-e)

1181-Q. Effect of Tool Design and Degree of Deformation on Distribution of Deformation in Pressed Steel Blanks. Yu. F. Chernyi. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 51-56. (Henry Brutcher, Altadena, Calif., Translation no. 4323.)

Tests made on heat resistant EI481 steel. Metallographic study of deformation on basis of reduction in size of original grains. The greatest nonuniformity in grain deformation was noted in peripheral zone of blanks. Least grain deformation was found in surface layers. As a result. metal in peripheral zone had a lowered plasticity. The identical size of grains in the cross-sectional area of pressed billets and blanks points to possibility of modulation of deformation process of grains of large ingots.
(Q24, G1; AY, SGA-h)

1182-Q.* (Russian.) **Influence of Increased Arsenic Content on Ductility of Rail Steel.** F. F. Sviridenko. A. N. Popova and M. G. Fradina. *Stal',* v. 18, Aug. 1958, p. 739-741.

Increasing As content from 0.13 to 0.25% has little effect on rail strength and does not alter its stability when tested on a ram impact machine. Tests were conducted after nine months aging. (Q23p, 2-60; ST)

1183-Q.* The Mechanical Properties and Heat Treatment Response of Zirconium-Uranium Alloys. W. Chubb and F. A. Rough. *American Society for Metals, Transactions,* v. 51, Preprint no. 84, 1958, 20 p.

Mechanical properties and heat treatment response of Zr alloys containing 0 to 100% U. Effect of typical heat treatments upon mechanical properties. Tensile properties, hardness and dynamic modulus data at various temperatures. Heat treatment response was determined primarily in terms of end-quench tests from 900° C. Results show a consistent pattern of behavior and permit practical heat treatment schedules to be devised. 6 ref.
(Q-general, 2-64, Zr, U)

1184-Q.* Hydrogen Embrittlement and Delayed Failure in Titanium Alloys. R. D. Daniels, R. J. Quigg and A. R. Troiano. *American Society for Metals, Transactions,* v. 51, Preprint no. 86, 1958, 17 p.

Hydrogen-induced delayed failure in an alpha-beta Ti alloy was sensitive to microstructure. A quenched structure was less susceptible to delayed failure than aged or annealed structures. The tendency for delayed failure was magnified in all structures by an increase in hydrogen content or an increase in strength level. Hydrogen-induced delayed failure occurred by a process of crack initiation and controlled crack growth. Plastic strain resulting from creep tended to retard crack initiation. 12 ref.
(Q26s, 3-71; Ti-b, *H*)

1185-Q.* Some Low-Temperature Observations of 1020 Steel. F. S. Deronja and M. Gensamer. *American Society for Metals, Transactions,* v. 51, Preprint no. 87, 1958, 11 p.

At grain size ASTM 4, 1020 steel has a 68° F. higher ductile-to-brittle transition temperature than at grain size ASTM 6, in simple tension. A 100-fold increase in testing speed has the effect of narrowing the transition range. The temperature at which there is a decrease in fracture stress was found to coincide with the approximate temperature at which twins first appear. Small jogs were observed in the load-extension curves and were found to be essentially due to twinning. Twinning precedes crack nucleation and propagation in the brittle range, and above the transition temperature can occur before the yield point phenomenon. 8 ref.
(Q23, Q24, 2-63; CN)

1186-Q.* The Phenomenon of "Negative Creep" in Alloys. R. W. Fountain and M. Korchynsky. *American Society for Metals, Transactions,* v. 51, Preprint no. 91, 1958, 13 p.

Measured creep elongation is a sum of true plastic deformation and length changes, resulting from the structural instability of alloys. As a special case, the contraction caused by a metallurgical solid-state reaction during creep testing may outweigh the elongation due to the applied stress and result in a phenomenon termed "negative creep". From the examples of some Fe-W and Ni-Mo alloys, it is shown that the amount of contraction can be calculated from the known phase relationships and crystallographic data. Experimental results illustrating "negative creep" in these alloys. 15 ref. (Q3, P10d)

1187-Q.* The Effect of Heat Treatment on the Elevated Temperature Stress Stability of Titanium Alloys. M. L. Greenlee, G. A. Lenning, W. M. Parris and H. D. Kessler. *American Society for Metals, Transactions,* v. 51, Preprint no. 94, 1958, 18 p.

Effect of heat treatment on unnotched and notched tensile properties, notch-bend impact strength, and elevated-temperature stress stability were investigated for three commercial Ti alloys. Strength increases obtained by heat treatment were of the order of 65,000 psi. for the Ti-140A alloy, 75,000 psi. for the Ti-155A alloy and 25,000 psi. for the Ti-6Al-4V alloy. No decrease in notch ductility or indication of instability was observed at the maximum strength level obtained for the Ti-6Al-4V alloy. 3 ref.
(Q27a, 2-62, 2-64; Ti-b)

1188-Q.* Effect of Strain Rate and Temperature on the Compressive Flow Stresses of Three Titanium Alloys. A. J. Griest, A. M. Sabroff and P. D. Frost. *American Society for Metals, Transactions,* v. 51, Preprint no. 95, 1958, 10 p.

Compression studies on unalloyed Ti, Ti-6Al-4V, and Ti-4Al-4Mn alloys in the range 1450 to 1725° F., and at strain rates in the range 0.0002 to 0.01 in. per in. per sec. At hot working temperatures the flow stresses of Ti alloys were markedly sensitive to strain rate. Increase of flow stress with increasing strain rate was greater for the Ti-6Al-4V and Ti-4Al-4Mn alloys than for unalloyed Ti. 16 ref.
(Q28, 2-61, 3-68; Ti-b)

1189-Q.* A Simplified Procedure for Calculating Peak Position in X-Ray

Residual Stress Measurements on Hardened Steel. D. P. Koistinen and R. E. Marburger. *American Society for Metals, Transactions,* v. 51, Preprint no. 102, 1958, 14 p.

New correction and calculation procedures for X-ray diffraction measurement of residual stresses in hardened high-carbon steels. Corrections for X-ray diffraction peak symmetry achieved by using standardized table of theta dependent, multiplicative factors based upon theoretical factors influencing diffractive intensity. Simplified parabola-fitting technique for establishing position of peak. Correlation of stresses measured by this technique with stresses measured by Christenson-Rowland technique and by a mechanical dissection technique. 7 ref. (Q25h, M22g, 1-54; ST)

1190-Q.* Stress Effects of Abrasive Tumbling. H. R. Letner. *American Society for Metals, Transactions,* v. 51, Preprint no. 104, 1958, 17 p.

Toolsteel specimens at four hardness levels were tumbled with aluminous abrasives under a variety of conditions and resulting surface stresses were measured. Behavior was observed for three initial stress conditions: stress-free surfaces, ground surfaces and heat treated surfaces. Residual stresses induced in initially stress-free steels by tumbling were compressive at the surface and decreased uniformly to zero at a depth of a few thousandths of an inch. The magnitude and depth of penetration of the stress increased with abrasive particle size. Maximum compressive stress at the surface increased and thickness of stress layer decreased with increasing steel hardness. Tumbling modified initial surface stresses and replaced them with its own characteristic compressive stress. 9 ref. (Q25h, L10d; TS)

1191-Q.* Thermal and Mechanical Fatigue of Nickel and Titanium. Harry Majors, Jr. *American Society for Metals, Transactions,* v. 51, Preprint no. 105, 1958, 12 p.

Thermal and load cycling tests were conducted on 0.500-in. diameter (I.D.) thin-walled tubes of Ti and Ni in direct loading under a constant mean temperature. Stresses and plastic strains were obtained. Controlled loading conditions were maintained by automatic electric timing circuits and resistance heating of the specimens. Analysis of the microstructure shows the influence of thermal cycles. 11 ref. (Q7j; Ni, Ti)

1192-Q.* The Application of Time-Temperature Parameters to Accelerated Creep-Rupture Testing. S. S. Manson, G. Succop and W. F. Brown, Jr. *American Society for Metals, Transactions,* v. 51, Preprint no. 106, 1958, 15 p.

Procedure for application of time-temperature parameters in determining isothermal creep-rupture curves when no previous data exist. Parameter constants and master curves determined over a wide stress range with a minimum expenditure of testing time. Isothermals are calculated for "17-22-A" steel and austenitic 16-15-6 alloy and the values are extended approximately two time cycles beyond the longest test necessary to develop master curves. Results of calculations are compared with isothermal data established by conventional test procedures. Concluded that the use of correct time-temperature parameters can greatly reduce required testing time. 15 ref. (Q3, 1-54; SS)

1193-Q.* High-Temperature Properties of Vacuum-Melted Superalloys. F. M. Richmond. *SAE Transactions,* v. 66, 1958, p. 193-199.

Improved high-temperature rupture strength and ductility of Ni-base superalloys has been obtained by vacuum melting and by certain modifications in the nominal chemistry. Melting technique. Tensile and rupture properties of five Ni-base vacuum-melted alloys for the temperature range 1000-1600° F. 10 ref.
(Q27a, 2-62, Q3, C25; Ni-b, SGA-h)

1194-Q.* Correlations of Brittle-Fracture Service Failures With Laboratory Notch-Ductility Tests. P. P. Puzak, A. J. Babecki and W. S. Pellini. *Welding Journal,* v. 37, Sept. 1958, p. 391s-407s.

Materials involved in the fractures included plain carbon steels from ships; A285 plain carbon and A212 C-Si steels from pressure vessels; A204 and A302 Mn-Mo steels from pressure vessels; A293 Ni-Mo-V steels from a pressure vessel and a turbine spindle; A293 Cr-Mo-V steel from retaining rings; 12% Cr cast martensitic stainless steels from ship propellers; and quenched and

tempered 3½ Ni, 1% Cr steel from forged machinery components. 13 ref. (Q26s, Q23p; CN, AY)

1195-Q.* Design Values for Thermal Stress in Ductile Materials. B. F. Langer. *Welding Journal,* v. 37, Sept. 1958, 411s-417s.

Methods for application of strain-cycling data to practical design problems involving thermal stress. Multi-axial stress conditions, combined steady and alternating stress and cumulative damage. When the calculated thermal stress exceeds the yield stress of a ductile material, some of the commonly used concepts, such as the Soderberg diagram, must be modified. 18 ref. (Q25p, 17-51)

1196-Q.* Thorium in Magnesium Technology. T. E. Leontis. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 29-53.

Physical and mechanical properties of Mg-Th and Mg-Th-Zr alloys; effect of Zr, Mg, Zn and rare earth additions on mechanical properties; commercial cast Mg alloys containing Th; commercial wrought Mg-Th alloys. 12 ref.
(Q-general, P-general, 2-60; Mg, *Th*)

1197-Q.* Mechanical Properties of Thorium and High-Thorium Alloys. J. A. Milko, R. E. Adams and W. O. Harms. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 186-216.

Properties of bomb-reduced and iodide Th and of high-Th alloys. Results of tensile, compression, torsion, fatigue, impact and hardness tests, and effects of testing temperature and alloying additions. 15 ref.

Mechanical property tests at high and low temperatures, weld and wire testing, corrosion testing.
(Q-general, R11, 2-62, 2-63)

1204-Q.* The Change of Fatigue Limit on Chromium or Nickel Plating With Particular Reference to the Strength of the Steel Base. C. Williams and R. A. F. Hammond. *Institute of Metal Finishing, Transactions,* v. 34, 1956-1957, p. 317-353.

A variety of steels of different compositions and ultimate tensile

strengths were plated and, for unbaked deposits, a linear relationship between the percentage change in fatigue strength on Cr plating and the fatigue limit of the steel substrate was established. It is thus possible to predict the percentage change in fatigue strength for deposits of known internal stress from the fatigue limit, the ultimate tensile strength, or hardness of the steel, irrespective of its composition; a simple formula is derived. 26 ref. (Q7a; ST, *Cr*, *Ni*, 8-12)

1205-Q.* Self-Restraint in Steel in Relation to Brittle Fracture. S. A. Main. *Iron and Steel*, v. 31, Oct. 1958, p. 479-484, 498.

Self restraint is effected in two, or possibly three, different ways. It can act in a purely static manner. Under dynamic conditions it is exerted additionally by the inertia of the metal and possibly to some extent through viscosity. The reactionary effects of self-restraint are illustrated by reference to the more ordinary forms of mechanical test. 15 ref. (Q26; ST)

1206-Q.* Elastic Constants of Silver and Gold. J. R. Neighbours and G. A. Alers. *Physical Review*, v. 111, Aug. 1, 1958, p. 707-712.

The three elastic constants C_{44}, $\frac{1}{2}(C_{11} - C_{12})$, and $\frac{1}{2}(C_{11} + C_{12} + 2C_{44})$ have been directly measured in the temperature range between 4.2 and 300° K. The various contributions to the values of the 0° K. constants are analyzed in terms of a simple model which quite successfully describes Cu. It is concluded that such a model is unsatisfactory when applied to the heavier noble metals because these appear to have large noncentral forces contributing to their constants. Combined with pressure data, the present results show the elastic constants to be explicit functions of temperature. The Debye characteristic temperatures calculated from the 0° K. elastic constants are shown to be in substantial agreement with the results from calorimetry. 19 ref. (Q21e; Ag, Au)

1207-Q.* Pressure Derivatives of the Elastic Constants of Copper, Silver and Gold to 10,000 Bars. W. B. Daniels and Charles S. Smith. *Physical Review*, v. 111, Aug. 1, 1958, p. 713-721.

Measured over the pressure range from 0 to 10,000 bars, using a modified ultrasonic pulse-echo method. Means are devised to measure the change of elastic constant with pressure as directly as possible. The data for each metal, of the three elastic constants and their pressure derivatives, are interpreted in terms of conventional theory. The analysis indicates that these must be noncentral, many-body interactions to account for the shear constants and especially their pressure derivatives. The many-body character of the interactions is of rapidly increasing importance in the sequence Cu, Ag and Au. 31 ref. (Q21, 3-74; Cu, Ag, Au)

1208-Q. Mechanical Properties of Uranium-Molybdenum Alloys. M. B. Waldron, R. C. Burnett and S. F. Pugh. *United Kingdom Atomic Energy Authority*, AERE M/R 2554, 1958, 33 p.

Tensile properties and hardness of U-Mo alloys in the composition range 0-14% Mo studied at room and elevated temperatures. At lower concentrations, the breakdown of the gamma solid solution to unstable microstructures leads to pronounced aging effects. Above 5.5% Mo the gamma solid solution is retained to room temperature and shows enhanced properties up to 800° C. 11 ref. (Q27a, Q29n; U, *Mo*)

1209-Q. Some Effects of Cold Rolling, Annealing and Aging on the Mechanical Properties of Zircaloy-3B. D. E. Johnson. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission, HW-53621*, Nov. 15, 1958, 58 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Tensile properties of Zircaloy-3B as a function of the cold worked condition of the material between the limits of 0 and 80% cold work. Tensile properties were also determined for test temperatures of −50, 22, 100, 200 and 300° C. Effect of short-time and long-time annealing on the tensile properties and of alpha-phase annealing treatments on microstructure and mechanical properties of a simulated Zircaloy-3B weld structure. (Q27a, 2-64, 2-65, 3-68; Zr-b)

1210-Q. The Influence of Composition Upon the 1500° F. Creep-Rupture Strength and Microstructure of Molybdenum-Chromium-Iron-Nickel Base Alloys. T. K. Roche. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, ORNL-2524*, July 9, 1958, 110 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.75.

Influence of composition variation upon the 1500° F. creep-rupture strength and microstructure. Alloys contained 10 to 20 Mo, 5 to 10 Cr, 4 to 10 Fe, 0.5 Al, 0.5 Mn, 0.6 C, balance Ni. Composition of the individual alloys was varied systematically with the intent that, by direct comparison, the effect of an element upon strength could be determined. 7 ref.
(Q3m, M27, 2-60; AY)

1211-Q.* **The Effect of Size on the Looseness of Wear Fragments.** Ernest Rabinowicz. *Wear,* v. 2, Aug. 1958, p. 4-8.

Whether a fragment transferred during sliding comes off as a loose wear particle depends on whether its elastic energy exceeds the surface energy at its point of attachment. Calculations show that, for an equiaxed fragment, there is a critical size such that smaller fragments remain adherent while larger fragments come off in loose form. Experimental support for this critical size concept is cited. 8 ref. (Q9)

1212-Q.* **Wear of Carbide Tools and Surface Finish Generated in Finish Turning of Steel.** Vladimir Solaja. *Wear,* v. 2, Aug. 1958, p. 40-58.

Concentrated tool wear, localized upon the boundaries of the areas of contact between rake face and chip and between the clearance face and workpiece, is a specific phenomenon encountered in turning of steel. It causes the surface finish to deteriorate rapidly, and in addition it can be supposed to be associated with the dimensional accuracy and the condition of surface layer of the workpiece. A number of variables including the grade of carbide tips used, workpiece material, rake and clearance angle of tools, feeds and speeds, were studied. 11 ref.
(Q9, G17; ST, 6-69)

1213-Q. (Czech.) **Plastic Stresses in Steels.** J. Nemec. *Hutnické Listy,* v. 12, no. 4, 1957, p. 315-324.

A solution is obtained to the problem of calculating the stress condition of nonhomogeneous material in the plastic range. Relationships between statistical strength of ductile steels and the fundamental physical parameters of the deformation of ferrite. Comparison of mathematical principles of the plastic state according to the theory of instantaneous stress condition and the theory of propagation of plastic deformation. Both theories are compared with experimental findings.
(Q24; ST)

1214-Q. (Chinese.) **Nature of Internal Friction Peaks Due to Stress-Induced Diffusion of Carbon in Alloy Steels With a Face-Centered Cubic Lattice.** Ke Tin-Sui, Tsian' Chzhi-Tsian and Uli Siuebao. *Acta Physica Sinica,* v. 12, no. 6, 1956, p. 607-621.

Internal friction peaks due to diffusion through an applied stress were observed in four types of Mn steel with a face-centered cubic lattice, containing 18.5, 25.4, 36% Mn and 9.5% Mn, 8% Ni and 3% Cr respectively. The optimum internal friction was observed at about 250° C. and an oscillation frequency of about 2 cycles per sec. The height of the internal friction peak varies in direct proportion to the C content in solid solution.
(Q22, N1; AY, *Mn*)

1215-Q. (Chinese.) **Internal Friction Peak Due to Stress-Induced Diffusion of Carbon in Martensite of Low-Carbon Steel.** Ke Tin-Sui, Ma In-Lian, Uli Siuebao. *Acta Physica Sinica,* v. 13, no. 1, 1957, p. 69-77.

Using torsional pendulum methods, at a temperature of 155° C. and an oscillation frequency of 2 cycles per sec., a maximum of internal friction was observed; conditions of occurrence were martensitic structure of the specimen and C and Ni impurities. An analogous peak was observed in Cr and Cr-Ni steels. In steel containing 29.7% Ni, the size of the internal friction maximum is directly proportional to carbon content.
(Q22, N1; CN-g, AY)

1216-Q.* (French.) **Influence of Duration of Charging and of Exposure to Ordinary Atmosphere on Hydrogen Brittleness in Steels.** J. Plusquellec, P. Azou and P. Bastien. *Comptes Rendus,* v. 246, June 23, 1958, p. 3454-3457.

Specimens of extra mild steel (0.08% carbon) from which all residual H had been removed were subjected to H charging for periods up to 100 hr. and exposed to ordinary air for different times before tensile testing. General capacity for deformation was lowered by presence of H, with reduction of area decreasing when duration of charging was increased. Fragility decreased in proportion to increased duration of exposure to air before testing. 4 ref. (Q26s; CN)

1217-Q. (Russian.) **Study of the Internal Friction in Gamma and Alpha-Phases of High-Chromium Steels.** Yu. V. Pigusov. *Doklady Akademii Nauk SSSR*, v. 112, no. 4, 1957, p. 636-639.

Specially melted steel 105 Kh 12 containing 1.05% C, 11.9% Cr, 0.012% N investigated. On curves correlating temperature and internal friction of specimens quenched from 800-1020° C. into water, a maximum value of internal friction appears about 210° C. at a frequency of 1.4 cycles per sec. Maximum value of internal friction about 210° C. is caused by interatomic reactions of the carbon with lattice defects, the latter being initiated by elastic stresses in the martensite lattice. (Q22; AY, *Cr*)

1218-Q.* (Russian.) **Effect of Forced Slipping at the End of Plastic Compression of Metals.** K. V. Savitskii and M. P. Zagrebennikova. *Fizika Metallov i Metallovedenie*, v. 5, no. 1, 1957, p. 113-119.

The effect of forced rotation of one of the supporting plates of a press investigated while the metal sample was being compressed. Results were plotted to compare with those obtained by compressing metal in the usual manner. The effect of speed of slipping on one side and alternate rotation of plates were examined. 5 ref. (Q28, Q1)

1219-Q. (Russian.) **Microstresses in Hardened Steel on Friction.** F. Ya. Iokheles and V. I. Startsev. *Metallovedenie i Obrabotka Metallov*, no. 3, 1957, p. 15-22.

Changes of microstresses in the crystal lattice, the dimensions of zones of coherent diffraction, as well as variation in microhardness and phase composition in thin surface layers in carburized, quenched and tempered steel 18 KhNWA investigated by X-ray in the processes of friction and wear. A series of tests consisted of several loading periods of 0.5×10^6 cycles each. X-ray diagrams were taken from six positions of the profile of the disk corresponding to different slip rates. The value of residual stresses and grain size determined from the form of the diffraction lines by means of harmonic analyses. (Q9, 3-66; ST)

1220-Q. (Russian.) **Temper Brittleness of the Second Type-Thermal Aging of Steel.** K. M. Pogodina-Alekseeva. *Metallovedenie i Obrabotka Metallov*, no. 3, 1957, p. 36-40.

Investigation of 45 G2, 30 KhGSA, 15 GS, and 12 KhNZA steels after conventional heat treatment. Embrittlement was accomplished by an anneal at 600-660° C. followed by slow furnace cool, or by repeatedly annealing soft tempered nonbrittle specimens to 550° C. with subsequent water cool. Temper brittleness of the second type is caused by the processes of dissolution of excess phases in ferrite, of concentration of the constituents in the grain boundary layers, and of their subsequent precipitation in form of individual phases with different degrees of dispersion. Analogous processes occur on thermal (precipitation) hardening of steel. (Q26s, N7; AY)

1221-Q. (Russian.) **Correlation Between Temperature and Internal Friction of Some Pure Metals.** V. S. Postnikov. *Uchenye Zapiski (Kemerovskii Gossudarstvenny Pedagogicheskii Institut)*, Series 1, 1956, p. 191-204.

Changes of internal friction as related to temperature investigated on Al, Ti, Co, Ni, Cu, Mo and W after annealing at 800° C. The ratio of the logarithmic damping decrement of free torsional oscillations to the number 11 was adopted as a measure of internal friction. It is experimentally demonstrated that the maximum of the internal friction (or the change of slope) is located in the range of recrystallization of a metal. Location depends on the height of the prior plastic deformation. Increase in plastic deformation leads to a displacement of the maximum to lower temperatures. (Q22, 2-61; Al-a, Ti-a, Co-a, Ni-a, Cu-a, Mo-a, W-a)

1222-Q.* (Spanish.) **Silicon-Bearing Cast Irons.** Mario Pujol. *Instituto del Hierro y del Acero*, v. 11, Apr-June 1958, p. 104-117.

Corrosion resistance and mechanical properties of spheroidal graphite iron containing 5.5% Si were good at temperatures up to 850° C. For higher temperatures, Si content of 6.5% gave satisfactory results. In lamellar iron with equivalent Si contents corrosion resistance was approximately the same, but mechanical properties were considerably inferior. 4 ref. (Q-general, R-general, 2-60, 2-61; CI-q, *Si*)

1223-Q.* (Spanish.) **Contribution to the Study of the Pearlitic Matrix of Gray Cast Iron.** Jose Navarro and

Luis Froufe. *Instituto del Hierro y del Acero*, v. 11, Apr-June 1958, p. 118-127.

An equation is deduced in which Brinell hardness of iron appears as function of hardness of matrix and notch factor of contained graphite. Statistical measurements of microhardness of pearlite grains of test bars gave virtually constant values. However, hardness of iron itself varied greatly. Calculation of tensile strength of pearlitic matrices, based on previous hardness measurements and on study of appropriate parameters, revealed no appreciable variation except for low coefficients of saturation. From comparison of hardness values and tensile strength of iron and its respective matrices, over-riding importance of effect of graphite in decreasing strength and hardness of unalloyed cast irons is deduced. 11 ref. (Q29n, Q27a; CI-n)

1224-Q.* (Spanish.) Microhardness. Francisco Munoz del Corral and Luis Alonso. *Instituto del Hierro y del Acero*, v. 11, Apr-June 1958, p. 128-137.

Specimens of 99.9% Cu and hardened steel were prepared for hardness testing by various combinations of machining and metallographic techniques. General conclusions were drawn as follows: A soft metal becomes brittle and exhibits high microhardness values under low loads as a result of alterations to surface layer. (However, annealed Cu specimens reduced 40 to 60% by cold rolling gave lower hardness values under low loads.) High hardness values can be corrected to correspond largely to hardness of nucleus by annealing in argon atmosphere and extended electrolytic polishing. A hard metal undergoes frictional heating and softening during machining and mechanical polishing, and gives lower hardness readings under small loads than under heavy loads. In this case, removal of softened surface layer by careful grinding and elimination of tendency to soften by tempering make it possible to obtain reasonably constant hardness values regardless of load. 7 ref.
(Q29q, Cu, ST)

1225-Q.* Cast Alloy Resist Heat. *Iron Age*, v. 182, Oct. 16, 1958, p. 192-194.

Some cast alloys will stand up well at 1500° F., others will operate satisfactorily up to 2000° F. Choose the alloy in terms of both temperature and operating conditions. Table of the chemistry of cast heat resistant alloys; charts showing how elevated temperatures affect heat resistant casting properties.
(Q-general, 2-62; 17-57; SGA-h, 5-60)

1226-Q.* Austenitic Manganese Steels for Abrasive Wear. *Iron Age*, v. 182, Oct. 16, 1958, p. 196-197.

Tough, ductile and nonmagnetic austenitic Mn steels can withstand both severe wear and heavy impact. Tables show mechanical, fatigue and physical properties.
(Q9, Q general; AY, *Mn*)

1227-Q.* Mechanism of Beneficial Effects of Boron and Zirconium on Creep-Rupture Properties of a Complex Heat-Resistant Alloy. R. F. Decker and J. W. Freeman. *National Advisory Committee for Aeronautics*, TN 4286, Aug. 1958, 54 p.

Mechanism by which the addition of B and Zr improves the creep-rupture properties of an alloy of 55% Ni, 20% Cr, 15% Co, 4% Mo, 3% Ti and 3% Al was investigated at 1600° F. Materials with varying B and Zr content were exposed to creep conditions, then the microstructures were analyzed by optical and electron microscopy, electron diffraction, microfractography and hardness measurements. Interrupted creep tests that allowed comparisons of materials after equivalent creep exposures were particularly useful. Creep-rupture properties were improved because B and Zr have a pronounced stabilizing effect on the grain boundaries of the alloy. 44 ref.
(Q3m, 2-60; Ni-b, SGA-h)

1228-Q. Effects of Irradiation on Some Uranium-Plutonium Alloys. J. H. Kittel and L. R. Kelman. Argonne National Laboratory. *U. S. Atomic Energy Commission ANL-5706*, 23 p. June 1958. (Available from U. S. Office of Technical Services, Washington 25, D. C.) 75c.

Cast alloys of uranium with 3.7, 6.6 and 13.0% Pu, and extruded alloys with 9.5, 14.1 and 18.7% Pu were investigated. Cast specimens developed severe surface roughening as a result of the irradiation they received, presumably because of excessively large grain sizes present before irradiation. As-extruded alloy specimens maintained good surface smoothness under irradiation but showed elongations which were dependent on Pu content. 11 ref.

1229-Q.* **Dependence of the Relative Heat Resistance on Composition in the System Cu-Ni-Si.** I. I. Novikov and L. I. Dautova. *Academy of Sciences of the USSR, Proceedings,* v. 115, (1957), p. 689-693. (Translation by Consultants Bureau Inc.)

Effect of various compositions on heat resistance (based on hardness of alloy at 700° C.), which rises to a maximum in heterogeneous regions of the phase diagrams. 13 ref. (Q-general, 2-52; Cu, Ni, Si)

1230-Q.* (Czech.) **Stresses in the Unit Metal-Enamel. Pt. 1.** Jaroslav Chmela. *Korose a Ochrana Materialu,* v. 2, no. 3-4, 1958, p. 38-42.

Stresses effective in cooling after enameling as well as those caused by raised or lowered service temperature. Stresses thought to be dependent on the difference between the expansion coefficients of enamel and metal in temperature changes, thickness of enamel coating, shape of the enameled part, properties of the prime layer of enamel and adhesive strength between enamel and metal.
(Q25k, L27)

1231-Q.* (Dutch.) **Imoprtant Factors in Bonding.** C. Jouwersma. *Metalen,* v. 13, Aug. 30, 1958, p. 284-289.

Study on the build-up of internal stresses during bonding and on external stresses effective, influenced by wetting properties, limits of plastic flow, moduli of elasticity, geometry of the bond. 10 ref. (Q25, K12)

1232-Q.* (Finnish.) **Brittle Fracture of Clean Mild Structural Steel.** J. E. Holmstrom. *Hitsaustekniikka,* no. 2, 1957, p. 29-34, 36, 38, 40, 50.

Effects of temperature, loading rate, thickness of material and heat treatment on the equicohesive temperature. Welding methods have been devised which keep the possibility of brittle failure to a minimum. Welding defects are classified according to importance, in the following order: cracks, penetration defects, reinforcements, edge undercuts, slag lines. It is undesirable to use and weld Thomas steel at temperatures below 0° C., since brittle failure is possible.
(Q26s; CN)

1233-Q.* (French.) **Mechanical Properties of the Light Alloys at Low, Medium and High Temperatures.** M. Tournaire. *Technique et Science Aeronautiques,* no. 6, 1957, p. 273-283.

Although physical properties of light alloys are essentially stable between −75° and +75° C. for long periods of time, at temperatures between 150 and 350° C. these properties change rapidly and precisely according to chemical composition of the alloy as a function of time and temperatures. Tables show tensile properties, fatigue and elastic properties for various compositions at different temperatures. (Q-general, 2-61; EG-a39, Al, Mg)

1234-Q.* (German.) **Structure of Lead Alloys and Creep Strength.** W. Hofman and H. V. Malotki. *Metall,* v. 12, Aug. 1958, p. 695-697.

Experiments on the correlations between structure and creep strength with Sn, Cd, In, Sb, Ti and Cu alloys showed that at a certain grain size the creep rate was a minimum. Rate decreases with increased Cu, Sn. Lead alloys of 0.09 at. % Cd or In and Pb-Sb-As alloys showed least creep speed increase in relation to recrystallization tendency. Recrystallization structures with large differences in grain size showed best creep properties. 18 ref. (Q3, 3-71; Pb-b)

1235-Q.* (Russian.) **Brittleness of Chromium.** S. T. Kishkin and I. O. Panasyuk. *Doklady Akademii Nauk SSSR,* v. 113, no. 6, 1957, p. 1263-1264.

Mechanical properties of Cr as a function of temperature. Low resistance to rupture at room temperature is connected with local distortions in the crystal lattice due to impurities which form interstitial solid solutions with Cr (N, O, H, C and B). Depending on the gas content, the threshold cold brittle temperature for Cr varies in the range 200-800° C. The biggest increase in brittleness of Cr is caused by dissolved N, which can diffuse from gaseous media into Cr on prolonged holding in the range from 700° C. upwards.
(Q26s, 2-61, 3-69; Cr)

1236-Q.* (Russian.) **Static and Cyclic Strength of Metallo-Ceramic Hard Alloys Consisting of Tungsten Carbide and Cobalt.** G. S. Kreymer, A. I. Baranov and O. S. Safonova. *Fizika Metallov i Metallovedenie,* v. 5, 1957, p. 361-364.

Cyclic strength of cobalt-tungsten carbide systems studied as a function of thickness of Co interlayers and as function of plasticity. Tests consisted of bending rotating specimens which were fixed on one side. Tests were based on five-million

loading cycles. Results confirm view that the reduction in plasticity of the Co interlayers with a decrease in thickness leads to a decrease in the strength and thus also to a decrease in the strength of the material as a whole.
(Q27a; W, Co, 6-69, 6-70)

1237-Q. (Russian.) **Internal Friction in Recrystallized Aluminum-Magnesium Alloys.** A. V. Grin'. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 383-384.

Study by the torsional vibration method of the relationship between temperature and internal friction in recrystallized alpha solid solution of Mg in Al for 0.01% Mg, 0.05, 0.5, 1 and 2%. Reduction in the height of the maximum internal friction due to grain boundaries, which occurs when the grain size is increased, together with the effect of Mg on the stress relaxation processes, are explained satisfactorily by the theory of intercrystalline internal adsorption.
(Q22, 2-60; Al-b, *Mg*)

1238-Q. (Russian.) **Internal Friction of Temper-(Hot)-Brittle Steel.** E. I. Kvashnina and V. I. Prosvirin. *Izvestiia Akademii Nauk USSR, Otdelenie Tekhnicheskikh Nauk,* no. 1, 1955, p. 157-159.

Measurements of internal friction of Type-35KHG steel in the ductile and temper brittle conditions. Internal friction was measured by the relative damping of free torsional oscillations in stress cycles of 8, 12 and 14 kg. per sq. mm. Effects of prolonged heating at 500° C., high-temperature heating of the embrittled steel and time of heating for high-temperature annealing followed by heating at 500° C. Data were obtained for comparison on the effect of prolonged heating at 500° C. on VT Mo-steel, in which temper brittleness does not exist. Internal friction of steel 35KHG increases due to the ferrite becoming denuded of carbon. (Q22, Q26s; AY)

1239-Q.* (Russian.) **Creep of Austenitic Steel Under Complex Stress.** I. A. Oding and G. A. Tulyakov. *Izvestiia Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 1, Jan. 1958, p. 3-10.

Tests were made on thin-walled metallic tubes with 0.09% Cr, 0.78% Mn, 0.36% Si, 0.010% S, 0.018% P, 10.68% Ni and 0.47% Ti at 600° C. (with preliminary heat treatment at 1100° C. and cooled in air) to determine creep properties under torsion stress. Experiments did not confirm the theory of directional coincidence of principal tensions and principal axes in deformation under prolonged stress. Observations of creep under complex stress revealed the redistribution of the main creep velocities with the alignment of the creep velocities in the main directions v_1 and v_2 and the creep velocity in a third direction v_3 converging to zero. (Q3; AY)

1240-Q.* (Russian.) **Regularities in the Dependence of Microhardness of Solid Solution Crystals on the Composition of Alloys in Three-Component Systems.** N. N. Glagoleva and V. M. Glazov. *Izvestiia Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 1, Jan. 1958, p. 130-134.

Dependence of microhardness on composition of the solid solution in the systems Al-Mg, Al-Si, Al-Mg-Si, Al-Cu, Al-Cu-Mg, Cu-Zn, Cu-Sn and Cu-Zn-Sn were studied on cross sections with 1:1 weight ratio between alloyed components. The relation of microhardness to composition in transistions from one phase to two-phase system was also studied. Cross sections and the composition of alloys are given at 550° for Al-Mg-Sn and at 500° for Cu-Zn-Sn.
(Q29q, 2-60, M24; Al-b, Cu-b)

1241-Q. (Russian.) **Effect of Shot Peening on the Cavitation Resistance of Metals in Magnetostrictional Vibration Tests.** L. A. Glikman and Yu. E. Zobachev. *Metallovedenie i Obrabotka Metallov,* no. 5, 1957, p. 38-41.

Heat treated specimens of plain (0.4 and 0.55% C) steel and steel 1Kh18N9T and of cast brass LMts-Zh55-3-1 were shot-peened and ground. Effect of peening on cavitation resistance was investigated on a magnetostrictional vibrator in sea-water, at 800 cycles per sec. and amplitudes of 70, 50 and 25. Criterion of cavitation resistance was the loss in weight of specimens after 3-hr. test. It was found that shot peening of the surface and the amplitude of the vibrations did not substantially affect cavitation resistance. (Q9, R2m, G23n; ST, Cu-n)

1242-Q. (Russian.) **Relationship Between Fatigue and Rupture Strength of Alloys at High Temperatures.** V. A. Parfenov. *Metallovedenie i Obrabotka Metallov,* no. 6, 1957, p. 17-23.

Specimens of E1617, E1395, E1437 and E1602 studied at 50 cycles per sec. The curves for both strengths, plotted in the same stress-time-to-

failure coordinates, intersect. When testing times are short (200-500 hr.), fatigue of the alloy is more probable; when they are long, creep failure is more common. Studies on the temperature dependences of these two strengths reveal that under the experimental conditions there is a certain temperature below which fatigue, and above which creep, failure is more probable. (Q7, Q3, 2-62; ST)

1243-Q. (Russian.) **Development of the Theory of Metal Fatigue.** I. A. Oding. *Vestnik Akademii Nauk SSSR,* no. 4, 1957, p. 24-30.

A number of fatigue phenomena are explained; directionality of cracking, effect of frequency of cyclic stressing on fatigue strength, and methods of increasing fatigue strength. Function of the stress gradient in fatigue failure, nature of scale factor and observed discrepancies between theoretical and effective concentration coefficients interpreted on the basis of dislocation theory. (Q7)

1244-Q.* (Russian.) **Dynamic Compressibility of Metals Under Pressure From 400,000 to 4 Million Atmospheres.** L. V. Altshuler, K. K. Krupnikov and M. I. Brazhnik. *Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki,* v. 34, Apr. 1958, p. 886-893.

Method for determination of pressures and densities of shock compression is based on measurement of velocities of propagation of strong shock waves. Dynamic compressibility of Cu, Zn, Ag, Cd, Sn, Au, Pb and Bi measured in the pressure range from 40,000 to 4,000,000 atm. The highest degrees of compression (2.26 and 2.28 times) were observed in Pb and Bi, elements with the highest atomic volumes. (Q28g, 3-74)

1245-Q.* (German.) **Temper Brittleness in Alloy Steel Castings.** Richard Werner. *Giesserei,* v. 45, Sept. 11, 1958, p. 556-560.

Experiments with test pieces from Cr-Mn, Mn-Si and Cr-Mo steels. Brittleness shown when steels of the first two groups in cooling after tempering were allowed to pass slowly through the range from 540 to 450° C. Therefore, after tempering, water quenching down to between 100° and 200° C.

1246-Q.* (German.) **Pre-stressing Effect on Soft and Medium-Hard Steels.** Hubert Hoff and Georg Fischer. *Stahl und Eisen,* v. 78, Sept. 18, 1958, p. 1313-1320.

Several blown steels of a tensile strength of 30 to 75 kg/mm^2 and two soft, rimming openhearth and basic steel respectively were tension, compression and bend tested. Pre-stressing (Bauschinger) effect increases with tensile strength and disappears in heating at stress-relief temperatures.

1247-Q. Effect of Frequency and Temperature on Fatigue of Metals. S. R. Valluri. *National Advisory Committee for Aeronautics,* Tn 3972, Feb. 1957, 15 p.

Phenomenological considerations applied to a standard-linear-solid physical model indicated that for particular temperatures there are corresponding frequencies of fatigue stressing above which the fatigue behavior changes. (Q7, 2-61)

1248-Q. (Russian.) **Study of Cold Shortness Resistance of Some Steel Compositions.** A. P. Sanina and M. M. Timofeev. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 57-58. (Henry Brutcher, Altadena, Calif., Translation no. 4324.)

Most effective for increasing cold shortness resistance are Mn, Si and Cr. (Q26s, 2-60; AY, *Cr, Mn, Si*)

1249-Q.* Low-Temperature Embrittlement of Austenitic Cr-Mn-N-Fe Alloys. F. W. Schaller and V. F. Zackay. *American Society for Metals, Transactions,* v. 51, Preprint no. 109, 1958, 15 p.

The ductility of austenitic Cr-Mn-N-Fe alloys is studied as a function of test temperature, interstitial content and strain rate. The low-temperature brittleness encountered was explained using a model with strain-induced martensite as the embrittling agent. At high strain rates, an anomalous increase in reduction of area was found and attributed to a localized temperature increase of the specimen. 23 ref. (Q26s, 2-63; SS, *Cr, Mn*)

1250-Q.* Mechanical Properties of Deformed Metastable Austenitic Ultra High Strength Steel. D. J. Schmatz and V. F. Zackay. *American Society for Metals, Transactions,* v. 51, Preprint no. 110, 1958, 13 p.

Austenitic alloy steels containing 0.28 to 0.98% C were deformed at subcritical temperatures and subsequently transformed to martensitic structures. A hardness increase from 2 to 4 points Rockwell "C" was obtained with deformations ranging from 25 to 75% with attendant increases in tensile

strength and yield strength. Yield strengths in excess of 300,000 psi. were obtained by tempering the deformed steels. At this strength level, ductilities of from 6 to 8% were consistently reproduced. Electron micrographs of the deformed steel indicated a refinement of the martensite. 18 ref.
(Q-general, N8, 3-68; AY, SGB-a)

1251-Q.* Mechanical Properties of Fe-Al-Si Alloys at Room and Elevated Temperatures. D. J. Schmatz and V. F. Zackay. *American Society for Metals, Transactions,* v. 51, Preprint no. 111, 1958, 11 p.

Investigation of properties of Fe-Al-Si alloys containing 5 to 9% Al and 0.5 to 2.4% Si. Si increased strength at both room and elevated temperatures. Ductility was markedly decreased by Si and interstitial elements. Si appeared to be more than additive to Al in improving oxidation resistance. Si raised order —disorder temperature and was additive to Al in initiating long-range order. Correlation between ordering temperature as determined by electrical resistivity and creep rate was noted. 9 ref. (Q-general, 2-60, 2-61, P15g; Fe-b, *Al, Si*)

1252-Q.* A Compilation and Interpretation of Cyclic Strain Fatigue Tests on Metals. J. F. Tavernelli and L. F. Coffin, Jr. *American Society for Metals, Transactions,* v. 51, Preprint no. 112, 1958, 13 p.

Cyclic-strain fatigue data from several investigators and the author's studies are compiled and interpreted from a plastic strain range point of view. The relationship $N^{1/2}\Delta\varepsilon_p = C$ best fits all the available data regardless of the metals tested, the temperature of testing and the manner of testing. Here N is the number of cycles to failure, $\Delta\varepsilon_p$ the plastic strain range, and C a constant. The significance of the fracture ductility to low-cycle fatigue is also discussed. When the fracture strain value is placed on the fatigue curve at $N = \frac{1}{4}$, good agreement results, thus giving a very simple method for predicting the fatigue behavior of the metal. 8 ref. (Q7, 1-54)

1253-Q.* The Effects of Microstructure and Heat Treatment on the Hydrogen Embrittlement of Alpha-Beta Titanium Alloys. D. N. Williams, F. R. Schwartzberg and R. I. Jaffee. *American Society for Metals, Transactions,* v. 51, Preprint no. 113, 1958, 13 p.

Four alpha-beta Ti alloys examined to determine the effects of heat treatment, alpha grain size and alpha grain shape on the amount of hydrogen required to induce low strain rate embrittlement (for example, their hydrogen tolerance). The tolerance was markedly dependent upon heat treatment, decreasing as the heat treatment temperature was lowered. Strength level did not appear to affect the hydrogen tolerance significantly. Increased alpha grain size decreased the hydrogen tolerance as did acicular grain shape. Strain-induced hydride was observed in a number of specimens and a tentative relationship between impact embrittlement, strain-induced hydride and low strain rate embrittlement was developed. Alloys were classified from most to least resistant to hydrogen embrittlement in the following order: Ti-6Al-4V, Ti-4Al-4Mn, Ti-8Mn, and Ti-2Mo-2Fe-2Cr. 9 ref. (Q26s, 2-64, 3-71; Ti-b)

1254-Q.* Properties of As-Cast and Heat Treated 2% Moybdenum-Uranium. E. G. Zukas. *American Society for Metals, Transactions,* v. 51, Preprint no. 115, 1958, 6 p.

Tensile and impact properties were determined for 2% Mo-U alloys from −198 to 100° C. after the following heat treatments: (a) as-cast, (b) water quenched from 850° C., (c) water quenched from 850° C. followed by aging at 450° C. for 1 hr., (d) homogenized and furnace-cooled, and (e) water quenched from 625° C. The tensile strengths reached a maximum at temperatures below −30° C. This temperature was influenced by heat treatment. Tensile and yield strengths well over 200,000 psi. were obtained by treament (c) but the alloy was quite brittle after this treatment. Impact strengths were generally low, especially below −30° C. A homogenization treatment followed by furnace cooling appeared to be a satisfactory and practical heat treatment. 5 ref.
(Q27a, Q6n, 2-64; U-b, *Mo*)

1255-Q.* Applications and Properties of Nodular Cast Iron. A. D. Main. *Castings,* v. 4, Aug. 1958, p. 9-21.

Properties of nodular cast iron; examples illustrate applications arising from these properties. 6 ref. (Q-general, 17-57; CI-r)

1256-Q.* Effect of Alloying Elements on Creep Behavior. J. Glen.

Iron and Steel Institute, Journal, v. 190, Oct. 1958, p. 114-135.

A simple theory is developed to explain transitions in creep rate and to show the effect of stress and temperature. Proof of this theory is given by the results of many creep tests on steel. The effects of N, C, Mn, Cr, Mo, V, Ti and Si as alloying elements. Results of creep tests on austenitic alloys and Ti alloys show that transitions in creep rate are a common occurrence in most commercial alloys. 34 ref. (Q3; 2-60; AY)

1257-Q.* Recent Developments in Creep Testing by the Cantilever Bending Method. G. T. Harris, H. C. Child, A. B. Collier and C. F. West. *Iron and Steel Institute, Journal*, v. 190, Oct. 1958, p. 136-143.

Cantilever creep units are capable of carrying out tests at temperatures up to 1200° C., at stresses of from 50 psi. to 50 tons per sq. in. with a sensitivity of strain measurement of from 1 to 3 $\times$ 10^{-6}. Several suitable applications of these units are exemplified. Satisfactory correlation of cantilever creep data with tensile data is possible. 4 ref. (Q3, 1-54)

1258-Q.* Effect of Cold Work on the Fatigue Characteristics of an Austenitic Alloy Steel. B. Cina. *Iron and Steel Institute, Journal*, v. 190, Oct. 1958, p. 144-157.

The limited beneficial effect of static cold work on the fatigue limit in alternating stress has been found to be due to the operation in the fatigue limit of a Bauschinger effect. A much greater benefit from cold work was obtained for pulsating tensile than for alternating stress. Light tempering after static cold work failed to raise the fatigue limit in alternating stress. 28 ref. (Q7a, 3-68; SS, *Mn, Ni*)

1259-Q.* Microhardness Testing. Vincent E. Lysaght. *Tool Engineer*, v. 41, Oct. 1958, p. 87-90.

Microhardness testing techniques provide accurate quality control for applications where conventional hardness testing equipment cannot be used. Examples are thin materials, plated coatings, small diameter wire and small precision parts. It is used to determine hardness gradients in superficially hardened surfaces, for exploring hardness variations over small areas, for determining the hardness of different alloy constituents. Microhardness testers fall into two general groups: those based on the scratch method and those operating on the indentation principle. (Q29q)

1260-Q.* (German.) Steel Castings With Special Properties. Ju. A. Nechendsi. *Freiberger Forschungshefte*, v. B24-3, July 1958, p. 19-46.

Wear resistance, heat resistance, corrosion resistance, magnetic and nonmagnetic properties; use for tools. (Q9, Q-general, 2-62, R-general, P16; ST, 5-60)

1261-Q.* (German.) Elastic Residual Stresses in Case Hardened and Nitride Hardened Steel Parts Detected With X-Rays. Helmut Hasenmeier. *Harterei-Technische Mitteilungen*, v. 12, no. 2, 1958, p. 23-37.

Stresses tested by X-ray diffraction. Best results obtained with an X-ray tube with Cr anode. To obtain pure K alpha-ray diagrams, a monochromator is used. By progressive electrolytic or chemical etching stresses in different depths could be examined.
(Q25h, 1-53, M22g, J28; ST)

1262-Q.* (German.) Long-Time Stress Testing in Multiple Instruments Above 500° C. Pt. 2. H. Wiegand. *Metall*, v. 12, Sept. 1958, p. 803-810.

Elongation tests with heat resistant materials. Testing instrument and furnace; preparation of samples, torsional stress resulting from the fastening in the specimen holders; distribution of hardness in machined notches. 10 ref.
(Q3, 17-53, Q29; SGA-h)

1263-Q.* (Russian.) Micro-Heterogenous Deformation of Metals While Being Heated at High Temperatures. M. G. Lozinskii, M. B. Guterman and E. I. Antipova. *Metallovedenie i Obrabotka Metallov*, June 1958, p. 6-9. (Henry Brutcher, Altadena, Calif., Translation no. 4245.)

Effect of high temperature and stress on flow characteristics of specially prepared metallic samples; definite local displacement found. To facilitate measurement of deformation, a pattern of indentations was made on the polished surface of the samples by a diamond point. After subjecting the samples to heat and stress the pattern was photographed. Displacement seems to be related to surface curvature of individual grains. 5 ref.
(Q24, 2-62)

1264-Q.* (Russian.) **Effect of Plastic Deformation on Heat Resistance of Alloy No. EI437.** S. T. Kishkin, A. A. Klypin and A. M. Sulima. *Metallovedenie i Obrabotka Metallov,* June 1958, p. 18-21. (Henry Brutcher, Altadena, Calif., Translation no. 4248.)

Plastic deformation exerts considerable influence on the durability of dispersion-hardening alloys such as EI437, greatly reducing it at 700-800° C. It is associated with the acceleration of basic dispersion processes resulting from lowering of tensile strength. At lower temperatures, when dispersion is retarded, grains break down into blocks, while at higher temperatures tensile strength is reduced. Fracture usually takes place near grain and twin boundaries. 5 ref.
(Q-general, 2-62, 3-68; Ni-b, SGA-h)

1265-Q.* **Raising Working Temperature of Steam Turbine Flat Spring Seals to 640°.** T. I. Volkova. *Metallovedenie i Obrabotka Metallov,* v. 4, June 1958, p. 21-25. (Henry Brutcher, Altadena, Calif., Translation no. 4249.)

According to technical requirements the springs were to maintain resilience under a load of 12 kg. per sq. mm. after an exposure to 585-640° for 10,000 hr. Several Soviet and foreign austenitic and Ni steels were tested. Mechanical properties, chemical composition and test results tabulated. (Q27a, Q23p, 2-62, T7c, 17-57; SS, AY, *Ni*)

1266-Q.* (Russian.) **Heat Resisting Properties of Copper-Chromium and Copper-Nickel Alloys.** A. P. Simakovskii. *Metallovedenie i Obrabotka Metallov,* June 1958, p. 41-47. (Henry Brutcher, Altadena, Calif., Translation no. 4253.)

While it is known that Cu is a corrosion resistant metal it is not sufficiently heat resistant above 250°. Cr raises heat resistance of Cu. Bars made up of Cu alloy containing Cr and Ni, respectively, as well as other elements, were subjected to extensive physical tests. Based on the results of these tests the Cu-Ni alloy no. MN5 is recommended for wide range of applications. 4 ref.

Marked atoms are used for investigating wear resistance of metals and metal coatings by studying their preliminary activation in the surface of the test specimen. (Q9, 1-59)

1279-Q. (Spanish.) **Three Key Figures in the Classification of High-Grade Construction Steels.** Rafael Calvo. *Instituto del Hierro y del Acero,* v. 11, Apr-June 1958, p. 97-103.

Hardenability, martensite transformation temperature and temperability as criteria; factors that influence these characteristics. (Q-general, J5, N8p; ST)

1280-Q.* **Spiral Bending Test for Electrodeposited Coatings.** J. Edwards. *Institute of Metal Finishing, Bulletin,* v. 8, Summer 1958, p. 101-106.

Method of measuring ductility. Plated strip is bent round a former in the shape of an equiangular (logarithmic) spiral and the radius of curvature at which the coating cracks is read off directly from graduations on the former. The percentage elongation at this point is calculated from radius of curvature and the thickness of plated strip. (Q5, 1-54; 8-12)

1281-Q. Some Principles for Developing Alloys Based on Borides of High-Melting Metals. K. I. Portnoi and G. V. Samsonov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 7, 1958, p. 140-141. (Henry Brutcher, Altadena, Calif., Translation no. 4344.)

Basic principles useful as guides in developing high-temperature alloys based on borides of refractory metals. Factors determining mechanical strength and plasticity; high-temperature strength; scaling resistance; thermal fatigue. (Q-general, 2-62; EG-d37, *B*)

1282-Q. (Czech.) **Effect of Arsenic on the Properties of Steel.** F. Benes. *Hutnické Listy,* v. 12, no. 1, 1957, p. 85-96.

Effect of 0.01-0.27% As on the properties of low-carbon (0.1% C), high-carbon (0.7% C), Cr-Mn-Si-Cu and Cr-Ni-W-Cu steels. As increases tensile and yield strength and decreases elongation and impact value of steel with 0.1% C, and hardly affects the properties of steel with 0.7% C. In alloy steels heat treated for high stability, it does not affect yield strength but decreases impact value. (Q-general, 2-60; AY, *As*)

1283-Q.* (French.) **Influence of Polygonization on the Mechanical Properties of Aluminum-Zinc Solid Solutions.** P. Gobin and J. Montuelle. *Comptes Rendus,* v. 247, July 28, 1958, p. 456-458.

Whereas polygonization almost completely prevents structural hardening of Al-Zn alloys after air quenching at 20° C., it only diminishes hardening after water quenching at 16° C. It also renders the alloy less sensitive to effect of a static stress slightly lower than the elastic limit; hence, polygonization acts as a stabilizing factor. (Q24, Q-general; Al, Zn)

1284-Q. (Russian.) **Optimum Chemical Composition of Type 1KH18N9T Stainless Steel.** M. I. Vinograd. *Metallurg,* no. 5, 1957, p. 13-16.

Limits for C and alloy content. Study of a large number of casts has shown that to obtain steel with small percentages of alpha-phase and not sensitive to intercrystalline corrosion, it is advantageous to specify different Cr, Ni and Ti contents for the steel, according to whether it is intended for tube or for plate. (Q-general, R2h, 2-60; SS)

1285-Q. (Rumanian.) **Properties of Low-Alloy Manganese-Molybdenum**

Steel for Structural Purposes. B. Rotenstein. *Studii si Cercetari Metallurgie,* v. 1, no. 2, 1956, p. 261-282.

Influence of Mn, Cr, Mo, Cu and C on mechanical properties (tensile strength, Rockwell hardness, impact value) and microstructure of 11 Mn-Mo steels; also on hardenability, reversible temper, brittleness, corrosion resistance and weldability. Low-alloy Mn-Mo steel with small additions of Cu and Si possesses sufficiently high mechanical properties and improved corrosion resistance and can be used as a substitute for Cr-Ni and Cr-Mo steels. (Q-general; AY, SGB-s, *Mn, Mo*)

1286-Q. (Russian.) **Increase in Durability of Cast Steel Propellers Using 1Kh14ND Stainless Steel.** A. M. Veingarten, M. L. Rozen, N. N. Sokolov, K. P. Lebedev, E. N. Liberman and E. K. Remizova. *Sudostroenie,* no. 3, 1957, p. 36-40.

Microstructural, mechanical and corrosion resisting properties of cast stainless steel containing C 0.05, Si 0.06, Mn 0.42, Cr 13.5, Ni 1.5, Cu 1.37, S 0.014, P 0.018, after various heat treatments. As quenched, the microstructure consists of coarse acicular martensite, with Cr-rich ferrite along the austenite grain boundaries. The best combination of strength and ductility is obtained after quenching in air from 1000-1050° C. and tempering at 680-700° C. The cooling rate after quenching and tempering has no noticeable influence on mechanical properties. (Q-general, M27, 2-64; SS)

1287-Q. (Russian.) **Mechanical Properties of Steel 55C2 at High Temperatures.** V. K. Prourzin. *Trudy Donetskogo Industrialnogo Instituta,* v. 19, no. 5-7, 1957, n.p.

To find the optimum rolling temperature for steel 55C2 the effect of temperature within the limits 20-1100° on tensile strength, yield strength and elongation was studied. Samples were quenched in oil from 860° and then annealed at 400° for 1 hr Tensile strength hardly changes up to 500°, but then drops sharply. In the range 820-900°, a halt in the drop of yield strength is observed, which is connected with recrystallization and change in grain size. (Q27a, 2-62, F23; ST)

1288-Q. (Slovenian.) **Replacement of Nickel by Other Alloying Elements in Standard Structural Steels.** Vasilij Terseglav. *Nova Proizvodnja,* v. 7, no. 6, 1956, p. 362-370.

Comparison of mechanical properties of Cr-Ni steels with Cr, Cr-Mo and Cr-Ni-Mo steels after various forms of heat treatment shows that it is possible to replace a number of steels containing from 1.5 to 4.5% Ni by lower alloy steels by additions of Mo.

1290-Q. (Czech.) **Effect of Some Factors on the Relaxation of Materials at High Temperatures.** Z. Lubomir. *Hutnické Listy,* v. 12, no. 4, 1957, p. 335-342.

Effect of temperature, initial stress and heat treatment on relaxation characteristics of metals at high temperatures, study of effect of surface coatings of Cr, Cr-Al and S on relaxation characteristics of Cr-W-V steels. The Oding method on ring specimens was employed. Surface layers produced on steel by impregnation do not appreciably affect relaxation. (Q3, AY)

1291-Q. (Russian.) **Effect of Thermomechanical Treatment on the Temper Brittleness of Alloy Structural Steels.** E. N. Sokolkov and L. V. Smirnov. *Metallovedenie i Obrabotka Metallov,* no. 3, 1957, p. 31-35.

Effect of combining hot plastic deformation with tempering in conditions which excluded the recrystallization of cold worked austenite as a cause of the tendency to reversible temper brittleness of 37XH3A, 35XGCA and 40XH4 steels. Samples of 37XH3A steel were heated to 1000°, cooled to 900°, rolled and tempered. Some of the samples were tempered without rolling. Testing of impact value after annealing in the range 200-650° showed that the combination of plastic deformation with tempering suppresses to a considerable extent the development of temper brittleness, eliminating fracture along the austenitic grain boundaries. (Q26s, Q24, J29; AY)

1292-Q. (Russian.) **Ductility of Cold Rolled Transformer Steel.** A. G.

Petrenko, A. V. Smirnova and L. A. Kurtova. *Stal'*, no. 5, 1957, p. 453-456.

Study of the structure showed that ductility is determined by the amount and form of the carbide phase. Coarse precipitates of carbide phase appear along the boundaries and inside the grains in specimens of low-ductility metal and there is also a zone of a eutectoid type of separation. In specimens which have received a great amount of bending, the amount of precipitated carbide phase is considerably less and the main mass is disposed within the grains as globules. Repeated annealing of the brittle metal at 750-850° decreases the amount of carbide phase and raises the ductility sharply.
(Q23p, N8r; AY, SGA-n)

1293-Q. (Russian.) **Properties of 20-XGP Steel.** N. I. Letchford. *Stal'*, no. 6, 1957, n.p.

Substitution for 20XHM of a cheaper steel not containing scarce elements did not result in a lowering of resistance to wear and stability of the components, but enabled the carburization process to be accelerated by 10-12% and did away with the need for high-temperature tempering after normalization of forgings. 20XGP steel, deoxidized by Ti, is prepared with a grain size of 6-7, and has tensile strength of 100 kg. per sq. mm., yield strength 80 kg. per sq. mm., elongation 9%, impact value 8 kg. per sq. cm.
(Q-general, 2-60; AY)

1294-Q. (Russian.) **Heat Resistant Cast Iron.** P. I. Durasov, B. S. Mil'man and N. A. Aleksandrov. *Standartizatsiya*, no. 2, 1957, p. 58-61.

Heat resistant alloy cast iron has been widely adopted. Composition is: Cr 0.3-0.5; Si 4.5-6.5 and Cr 0.5-1.5, Ni 14.0-17.0, Cu 6.0-8.5 and Cr 1.5-2.5. Silicon heat-resistant cast iron with spheroidal graphite has best heat resistant and mechanical properties. Spheroidal graphite is provided by treatment with Mg.
(Q-general, 2-62; CI-r, CI-q; *Si*)

1295-Q. (Russian.) **Properties of EI-257 Steel After 20,000 Hours in Service.** T. A. Mikhailova. *Teploenergetika*, no. 3, 1957, p. 41-44.

Structure and properties of EI-257 steel, used in the steam tubes of a uniflow boiler working at 600° and at a pressure of 300 atm. Composition of the steel after 20,000 hr. of service was C 0.11, Mn 0.33, Si 0.42, Cr 13.65, Ni 12.0, W 2.5, Mo 0.68. Metallographic tests of base metal and welded joints were made, together with mechanical and corrosion tests. Results are related to the specified period of service of the metal after 3000, 7500 and 14,000 hr. Standard boiling tests showed no decrease in the susceptibility of the steel to intercrystalline corrosion after 20,000 hr. service.
(Q-general, R4; SS)

1296-Q. (Russian.) **Resistance of Metastable Nitride Phases to Wear and Corrosion.** P. L. Gordienko and A. V. Smirnov. *Trudy (Leningradskii Institut Aviatsionnogo Priborostroeniya)*, no. 22, 1957, p. 23-28.

Specimens of technically pure Fe were nitrided and subsequently quenched under various conditions to obtain the nitride phases on the surface, and then tested for wear and corrosion in a 3% solution of NaCl. Tests indicate that a mixture of nitride austenite and nitride martensite had little resistance to omega, the martensite being the more resistance and the beta phase less resistant than martensite.

1312-Q. (Czech.) **Internal Friction in Austenitic Steels.** J. Vodsedalek. *Strojirenstvi,* v. 6, no. 11, 1956, p. 757-762.

Damping properties, over a wide range of loads and working temperatures, of heat resisting steels, based on Fe with additions of Cr, Ni, Co, used as steam turbine blade materials. Problems of fatigue strength at high temperatures and effects of initial amplitude of vibration, prolonged cyclic and static stress conditions. Mechanism of damping of vibrations in austenitic steels is connected with the formation and migration of dislocations and the formation of new phases.
(Q22; SS, *Cr, Ni, Co*)

1313-Q. (German.) **Evaluation of Notch Impact-Bending Tests.** G. Schutz. *Fertigungstechnik,* v. 8, Sept. 1958, p. 413-417.

Tables for fast and precise determination of impact strength. (Q6)

1314-Q. (Russian.) **Procedure for Fatigue Testing at Variable Load Conditions.** D. N. Reshetov and S. A. Shuvalov. *Vestnik Mashinostroeniya,* v. 38, Sept. 1958, p. 3-7.

Since the majority of machine parts operate under continuously variable load conditions and changing amplitude, fatigue test was devised for industrial conditions where load varies every 30 sec. 10 ref. (Q7)

1315-Q. Strength of an Alloy Containing Zones. A. Kell and M. E. Fine. Northwestern University Dept. of Metallurgy. *U. S. Office of Technical Services,* PB 124768, Dec. 1956, 10 p. (Available at Library of Congress, Washington, D. C.—Microfilm $1.80; Photostats $1.80.)

Rough estimates of the stress necessary to force dislocation through a Guinier-Preston zone in an Al alloy containing 2 at.% Cu and in an Al alloy containing 13 at. % Ag. Suggested that the process of shearing the zones determines the initial flow stress in these age-hardening alloys. (Q24, N7a; Al-b)

1316-Q. Delayed Yielding in a Substitutional Solid Solution Alloy. L. A. Shepard and J. E. Dorn. California University, Institute of Engineering Research. *U. S. Office of Technical Services,* PB 125561, Feb. 1956, 36 p. (Available at Library of Congress, Washington D. C.—Microfilm $3; Photostats $6.30.)

Effect of temperature and stress on the delayed yielding arising for substitutional locking of dislocations in the face-centered cubic system. Specimens of an Al alloy containing 2% Mg were prestrained to 25,000 psi. at 78° K. and then aged for 15 min. at 273° K. to develop a pronounced yield point at 78° K. Delayed yielding tests were performed at 78 and 114° K. at a series of constant stresses below the upper yield point observed in a tensile test. The delay time for yielding was found to depend on the product of two separable functions of stress and temperature.
(Q24c; Al-b, *Mg*)

1317-Q. Activation Energies for Creep of High Purity Aluminum. O.

D. Sherby, J. L. Lytton and J. E. Dorn. California University, Institute of Engineering Research. *U. S. Office of Technical Services,* PB 125935, Apr. 1956, 27 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.70; Photostats $4.80.)

Activation energies for creep of high-purity Al were obtained over the temperature range from 77 to 880° K. by rapidly changing the temperature during creep at constant stress. The experimentally obtained activation energy was shown to be insensitive to stress and strain. From 500 to 880° K. the activation energy for creep was found to be independent of temperature and equal to 35,500 cal. per mole which is the same as that for self-diffusion of Al. (Q3, P13a; Al-a)

1318-Q. Survey of the Recovery of Damping and Modulus Changes Following Plastic Deformation. Akira Hikata and Andrew Granato. Brown University, Metals Research Laboratory and Graduate Div. of Applied Mathematics. *U. S. Office of Technical Services,* PB 125954, Jan. 1957, 27 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.70; Photostats $4.80.)

Measurements of changes in attenuation and elastic constants with time following plastic deformation compared with results of a theory which assumes these changes are a result of dislocation pinning by deformation-induced point defects. A check of the temperature dependence is afforded by recovery measurements of Young's modulus for Cu. (Q24, Q8; Cu)

1319-Q. Statistical Formulation for Creep of Metals. J. Lambert Bates, Taikyue Ree and Henry Eyring. Utah University, Institute for the Study of Rate Processes. *U. S. Office of Technical Services,* PB 125970, June 1956, 37 p. (Available at Library of Congress, Washington, D. C.—Microfilm $3; Photostats $6.30.)

A reasonable physical explanation of flow processes is found by use of tensile data. Parameters in the creep equation for a large number of metals and alloys evaluated. (Q3)

1320-Q. Effect of Porosity on Mechanical Properties of Metals and Alloys. Vincent DePierre. Naval Gun Factory. *U. S. Office of Technical Services,* PB 126018, May 1956, 13 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.40; Photostats $3.30.)

Porosity has a deleterious effect on tensile strength, yield strength, elongation, impact and fatigue strength. Tensile strength and ductility are seriously lowered by small percentages of porosity. Yield strength is only slightly affected. (Q-general, 3-71, 9-68)

1321-Q. Tensile Properties of Zone-Refined Iron in the Temperature Range From 298 to 4.2° K. R. L. Smith and J. L. Rutherford. Franklin Institute, Laboratories for Research and Development. *U. S. Office of Technical Services,* PB 126111, Sept. 1956, 49 p. (Available at Library of Congress, Washington, D. C.— Microfilm $3.30; Photostats $7.80.)

The higher the purity, the lower the flow stresses and the better the low-temperature ductility. Yield stresses as low as 3800 psi. have been observed at room temperature and elongations of 10% have been observed at 4.2° K. The major portion of the ductility at 4.2° K. arises from twinning. Deformation by twinning at 4.2° K. is not suppressed by prestraining at room temperature and the twins occur all through the test. (Q27a, 2-63; Fe-a)

1322-Q. Engineering Application of the Absolute Rate Theory to the Creep of Cast Magnesium. Mervin B. Hogan. Utah University, Institute for the Study of Rate Processes. *U. S. Office of Technical Services,* PB 126152, Apr. 1955, 46 p. (Available at Library of Congress, Washington, D. C.—Microfilm $3.30; Photostats $7.80.)

Experimental data analyzed in terms of a four-element mechanical model as an analogue, in conjunction with the absolute rate theory. (Q3; Mg-b)

1323-Q. Elastic Constants of Magnesium and Magnesium Alloys. T. R. Long. Case Institute of Technology. *U. S. Office of Technical Services,* PB 126172, Jan. 1956, 26 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.70; Photostats $4.80.)

The adiabatic elastic constants of single crystals of Mg and dilute alloys of Mg with Ag, In and Sn measured by the ultrasonic pulse echo technique. Specific values given. (Q21; Mg-b)

1324-Q. Bending of Coated Zinc Crystals. L. C. Weiner. Columbia University, School of Engineering. *U. S. Office of Technical Services,* PB 126293, Aug. 1957, 5 p. (Available at Library of Congress, Washington, D. C.—Microfilm $1.80; Photostats $1.80.)

(Q24; Zn, 14-61)

1325-Q. Arc-Cast Molybdenum Base Alloys. M. Semchyshen and R. Q. Barr. Climax Molybdenum Co. *U. S. Office of Technical Services,* PB 126447, 1955, 435 p. (Available at Library of Congress, Washington, D. C. —Microfilm $11.10; Photostats $63.30.)

Deoxidation and hot plasticity; mechanical properties of wrought alloys; effect of variation in strain hardening on mechanical properties and recrystallization temperature; embrittlement resulting from exposure to elevated temperature; coatings for protection of Mo against oxidation. (Q-general; Mo-b)

1326-Q. V-Notch Charpy Impact Testing of Weld Metal and Heat Affected Zone Simultaneously. William P. Hatch, Jr., and Carl E. Hartbower. U. S. Arsenal. *U. S. Office of Technical Services,* PB 126527, Dec. 1955, 14 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.40; Photostats $3.30.)

Composite test is sensitive to variations in weld metal and heat affected zone toughness and to a seemingly minor variation in welding procedure. The test provides, at least in part, a method for evaluating the relative notch-toughness characteristics of weld metal and heat affected base metal in a natural environment. (Q6, K9r, 7-51)

1327-Q. Factors Responsible for Notch Embrittlement of High-Strength Steels. V. Weiss and E. P. Klier. Syracuse University Research Institute. *U. S. Office of Technical Services,* PB 126571, Dec. 1955, 45 p. (Available at Library of Congress, Washington, D. C.—Microfilm $3.30; Photostats $7.80.)

Hardenability studies for various heat treatments on 4340 steel with a Jominy specimen 2.5 in. diameter and 8 in. long. The two-step and 12-hr. austenitizing treatments were found to yield the best hardenability. Three treatments listed in sequence of increasing merit by notch tensile tests at room temperature on 1.1 and 1.5-in. diameter 4340 steel specimens are: conventional, Lockheed, two-step. Studies of the fracture process were conducted on 4340 steel and two Al alloys for qualitative comparison.
(Q26s, J5; AY, SGB-a)

1328-Q. Damping, Elasticity and Fatigue Properties of Titanium Alloys, High-Temperature Alloys, Stainless Steels and Glass Laminate at Room and Elevated Temperatures. E. R. Podnieks and B. J. Lazan. Minnesota University, Dept of Mechanics and Materials. *U. S. Office of Technical Services,* PB 128211, Mar. 1956, 93 p. (Available at Library of Congress, Washington, D. C.—Microfilm $5.40; Photostats $15.30.)

Resonant fatigue properties in form of curves determined for several characteristic types of parts of the materials named.
(Q7a, Q21, Q8; Ti-b, SS, SGA-h)

1329-Q. Research and Development of Wrought and Cast High-Temperature Alloys. R. R. MacFarlane, R. S. DeFries, E. E. Reynolds and W. W. Dyrkacz. Allegheny Ludlum Steel Corp. *U. S. Office of Technical Services,* PB 129969, Oct. 1954, 98 p. (Available at Library of Congress, Washington, D. C.—Microfilm $5.40; Photostats $15.80.)

Study of Co-base and Fe-base alloys. An alloy containing 10% Ni, 10% Cr, 10% W, 5% Mo and 1% Cb + Ta was outstanding in rupture properties for the wrought Co-base alloys at 1500 to 1700° F. An 18% Mn, 12% Cr, 3% Mo, 0.8% V alloy had a good combination of properties at 1200° F. for the wrought Fe-base alloys. Thermal shock properties were best for the cast alloys containing the highest Co. No correlation was apparent between thermal shock characteristics and other commonly measured properties.
(Q3, Q10a; Co, Fe, SGA-h)

1330-Q. Determination of Tensile, Compressive, Bearing and Shear Properties of Ferrous and Nonferrous Structural Sheet Metals at Elevated Temperatures. John V. Melonas and J. Robert Kattus. Southern Research Institute. *U. S. Office of Technical Services,* PB 131461, Sept. 1957, 308 p. $6.50.

Properties determined at various temperatures after exposure times of ½ to 1000 hr. at the test temperature for AISI 4130 alloy steel, 150,000-psi. nominal strength level; AISI 4130, 180,000-psi. nominal strength level; AISI 4130, 200,000-

psi. strength level; A110-AT Ti alloy; HK 31-H24 Mg alloy; Type-301 stainless steel, full-hard. The Mg alloy was tested over a temperature range from 75 to 600° F., whereas the other metals were tested at temperatures up to 1000° F.
(Q27, Q28, Q2, Q9, 2-62; AY, Ti, Mg, SS)

1331-Q. Effects of Inelastic Action on the Resistance to Various Types of Loads of Ductile Members Made From Various Classes of Metals. Pt. 7. Inelastic Behavior of Aluminum Alloy I-Beams With Elliptic-Type Web Section Cutouts. Will J. Worley and Fred D. Breuer. Illinois Engineering Experiment Station. *U. S. Office of Technical Services,* PB 131556, Dec. 1957, 31 p. $1.

(Q24; Al-b)

1332-Q. Effect of Various Machining Processes on the Reversed-Bending Fatigue Strength of A-110 AT Titanium Alloy Sheet. Robert J. Rooney. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131606, Nov. 1957, 14 p. $.50.

Results of reversed cantilever bending fatigue tests on A-110 AT (5% Al, 2.5% Sn) sheet, machined by various processes: ultrasonic, slab milling, chem-milling. Effect of shot-peening on the fatigue strength of the "as-rolled" alloy.
(Q7a, G17, G24; Ti-b)

1333-Q. Thermal Properties of High-Temperature Materials. I. B. Fieldhouse, J. C. Hedge, J. I. Lang and T. E. Waterman. Armour Research Foundation. *U. S. Office of Technical Services,* PB 131718, Feb. 1958, 88 p. $2.25.

Materials investigated were Hastelloy B, Hastelloy C, Satellite 21, stainless steels 17-7PH, and Type 446, silicon carbide, 60-15 Cr (AST M B 83-46), and Be. The thermal conductivity, specific heat and linear coefficient of thermal expansion were from 1000 to 3000° F., or the melting point of the material, whichever was lower. Experimental measurements and results of conversion of these measurements to the desired physical properties.
(Q-general, 2-62; SGA-h, Ni, SS, Be)

1334-Q. Fatigue Strength Reduction Factors for Inclusions in High-Strength Steels. H. N. Cummings, F. B. Stulen and W. C. Schulte. Curtiss-Wright Corp. *U. S. Office of Technical Services,* PB 131816, Apr. 1958, 39 p. $1.

Tentative values of fatigue strength reduction factors for nonmetallic, nonmalleable inclusions in single-nucleus fractures of rotating beam specimens are determined by two methods. Data for the computations are taken from tests on 309 specimens of SAE 4340 and 4350 steel, of 140,000, 190,000, 230,000, 260,000 and 300,000 psi. ultimate strength. Values of the factors depend upon size of the inclusions and upon hardness level of the steel. For very small inclusions (less than 0.00025 in.) other inhomogeneities inherent in the steel itself dominate the failure of a specimen.
(Q7a, 9-69; AY, SGB-a)

1335-Q.* Creep Under Changing Complex Stress Systems. A. E. Johnson, J. Henderson and V. Mathur. *Engineer,* v. 206, Aug. 22, 1958, p. 287-291.

Creep rate-complex stress-time relations in a 0.2% C steel at 450° C., on Al alloy RR59 at 150 and 250° C., and in a Mg alloy (2% Al) at 20 and 50° C. Experimental data compared with mechanical theories of creep.
(Q3, 3-66; CN, Al, Mg)

1336-Q.* Effect of Induction Hardening on Fatigue Strength. Hiroshi Nakamura, Tatsuo Amakasu and Shiro Ueda. *Japan Society of Mechanical Engineers, Transactions,* v. 24, July 1958, p. 475-479.

Influence of induction hardening on the fatigue limit of circular specimens of induction hardened, plain carbon steel containing 0.41% C. Adequate heating time gives maximum fatigue limit; proportional relations exist between fatigue limit and surface hardness; commercial criteria for optimum heating time exist. 8 ref. (Q7a, 2-64, J2g; CN)

1337-Q.* Study of Hydrogen Embrittlement of Iron by Internal-Friction Methods. R. E. Maringer, E. B. Swetnam, L. L. Marsh and G. K. Manning. *National Advisory Committee for Aeronautics TN 4328,* Sept. 1958, 62 p.

Effects of electrolytic charging on the properties of relatively pure Fe and tempered 4340 steel investigated metallographically and by observing internal friction behavior from −196 to 430° C. Electrolytic

charging caused severe structural damage to both Fe and steel, consisting of blisters and internal cracks. In Fe, cracks appeared to initiate grain boundaries and spread in a transgranular fashion. Removal of carbon by a wet-hydrogen anneal resulted in strictly intergranular cracking. Reverse-bend testing was used to demonstrate hydrogen embrittlement of these materials. 38 ref.
(Q26s, Q22; Fe-a, ST)

1338-Q. (English.) **Characteristics of Glide Caused by Stretching a Scratched Aluminum Single Crystal.** Tsien Ling-Chao and Ho Shaw-an. *Scientia Sinica,* v. 6, no. 2, 1957, p. 217-222.

At the start of plastic deformation, an artificial glide occurs earlier than ordinary slippage. Artificial glide can be used to study the effect of thin surface films on the process of gliding in the crystal, on the shear process near the grain boundaries in polycrystals, the influence of surface microscopic cracks on the strength of the crystal. (Q24; Al, 14-61)

1339-Q.* **Strength and Thermal Limitations of Materials for Airframe Components.** J. C. Ekvall. *Society of Automotive Engineers,* Preprint no. S109, 1958, 11 p.

Properties of presently available and advanced development Al, Mg, Ti alloys, low-alloy steel, corrosion resistant steels and Ni, Co and mixed-base alloys. Strength of each group is indicated for typical airframe components at various temperatures. Material-efficiency curves indicate thermal limitations in each case. 18 ref. (Q27a, 2-62, Q10a, T24a; Al, Mg, Ti, AY, SS, Ni, Co)

1340-Q.* (German.) **Influence of Temperature Upon the Elasticity Modulus of the Iron-Chromium Sigma Phase.** Karl Bungardt and Wolfgang Spyra. *Archiv für das Eisenhüttenwesen,* v. 29, Aug. 1958, p. 471-477.

Two Fe-Cr alloys with 45 and 41% Cr investigated as to their change in elasticity modulus, electric resistance and heat expansion with changing temperatures. Results are compared with the properties of an Fe-V alloy with 27% V and an Fe-Ni alloy with 74% Ni. The elasticity modulus of the Fe-Cr sigma phase decreases with decreasing temperatures and increases with rising temperatures. 21 ref. (Q21a, 2-61; SS)

1341-Q.* (German.) **Short-Time Fatigue Strength at Elevated Temperatures of Platinum Materials Between Room Temperature and 1250° C.** G. Reinacher. *Metall,* v. 12, July 1958, p. 622-628.

Platinum wires (2 mm. diameter) with 5% In, 5% Rh or 4% Pd were subjected to short-time fatigue tests between 20 and 1250° C. The influence on higher fatigue strength of the alloying components is imperceptible at 1250° C. Alloys with 5% In or Rh in the temperature range between 700 and 900° C. showed a fracture without deformation, while at 500 and 1250° C. ductile fractures with reduction of area were observed. 9 ref.
(Q7a, 2-62; Pt)

1342-Q.* (German.) **Hardening and Deformation of Gold Alloys.** E. Wagner. *Metall,* v. 12, July 1958, p. 628-630.

Investigations on a 14-karat jewelry alloy with 58.5% Au, 20% Ag and 21.5% Cu under the mutual influence of cold deformation and hardening showed properties like Al and Cu alloys. Diagrams for hardness as a function of rolling ratio and annealing time. (Q24, Q29n; Au-b)

1343-Q.* (German.) **Steels With 11 to 20% Chromium—Long-Time Brittleness Tests at 475° C.** Ewald Baerlecken and Heinz Fabritius. *Stahl und Eisen,* v. 78, Oct. 2, 1958, p. 1389-1395.

Literature review on the brittleness tendency of steels with 11 to 20% Cr. (Q26s, 2-62; ST, *Cr*)

1344-Q.* (Russian.) **Investigation of Impact Fatigue.** N. N. Davidenkov and E. I. Belyava. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 12-15. (Henry Brutcher, Altadenda, Calif., Translation no. 4349.)

Study of fatigue strength limits under dynamic and static conditions. Study of 10^5 cycles showed that their magnitudes are dependent on the character of thermal treatment and consist of 0.80-0.90 for low temper and 1 for high temper. The less stable the condition of steel the lower are its fatigue limits. The size of the tested specimen has no effect on fatigue strength. (Q7; ST)

1345-Q.* (Russian.) **Some Properties of Iron-Copper Alloys Produced by Infiltration Process.** I. N. Frantsevich and O. K. Teodorovich. *Metallove-*

denie i Obrabotka Metallov, v. 4, Sept. 1958, p. 20-23. (Henry Brutcher, Altadena, Calif., Translation no. 4351.)

Study of metallo-ceramic Fe and Cu-base alloys for machine building. With a 50% Cu content the mechanical properties of Cu-Fe alloys are determined primarily by the Cu-based phase. With a 25% Cu content, the Fe-based phase predominates, with a carcass structure with plasticized fillers. The strength characteristics are typical for those of single-phased Cu-Fe alloys. At high temperatures the Cu phase tends to extend into the Fe grain boundaries and to disintegrate its carcass structure. This process is accompanied by a drop in strength and an increase in plasticity. 10 ref.
(Q-general, M27d, H16e; Fe, Cu)

1346-Q.* (Russian.) **Properties of Surface Zone of Mechanically Worked Steel Containing Various Amounts of Carbide.** I. L. Mirkin and T. A. Sirenko. *Metallovedenie i Obrabotka Metallov*, v. 4, Sept. 1958, p. 29-33. (Henry Brutcher, Altadena, Calif., Translation no. 4354.)

The surface characteristics of structural steel worked with a mandrel differ considerably from those of original material. The strength of thin surface layer is twice that of original metal. The stress distribution in thin surface layers during metal working depends on the amount of cementite in steel. With the increase of hard and brittle carbide particles there is a decrease in strength and depth of the deformed surface. 6 ref. (Q25, Q24; ST)

1347-Q.* (Russian.) **Influence of Heat Treatment on Anisotropic Properties of Toolsteel Sheet.** E. I. Astrov. *Metallovedenie i Obrabotka Metallov*, v. 4, Sept. 1958, p. 33-38. (Henry Brutcher, Altadena, Calif., Translation no. 4355.)

Investigation of cold rolled sheet and plate steel specimens. As a result of heating to temperatures above critical point, the anisotropy of plate toolsteel is lowered by three times and the crystallographic anisotropy is lowered two times. After quenching in oil and annealing, as well as after gradual and isothermal quenching, the degree of anisotropy remains the same as that of normalized steel. 5 ref.
(Q24, 2-64; TS, 4-53)

1348-Q.* (Russian.) **Effect of Strain Hardening on Creep Characteristics of Austenitic Steels.** N. D. Sazonova. *Metallovedenie i Obrabotka Metallov*, v. 4, Sept. 1958, p. 46-49. (Henry Brutcher, Altadena, Calif., Translation no. 4358.)

Effect of degree of preliminary deformation at room temperature on creep characteristics. Three types of austenitic steels quenched in oil at 1180 and 1200° were used. Specimens were 200 mm. long, 10 mm. in diameter. By increasing the degree of cold hardening there is less elastic deformation, while the speed of creep formation increases. Preliminary deformation at room temperature increases resistance of metal to creep.
(Q3, 3-68; SS)

1349-Q.* Found . . . a Low-Alloy Steel for Missiles. William M. Stocker, Jr. *American Machinist*, v. 102, Aug. 25, 1958, p. 72, 73.

Produced in the annealed or "soft" condition for comparatively easy forming or cutting (equivalent to 4340), this material, when cooled in air and tempered, develops tensile strength levels in the 280,000-psi. range. Flat-rolled sheet provides a minimum of 5% elongation, transverse and longitudinal, in the full-hard condition. In general, the new steel attains this high strength level as a result of carefully balancing the alloying elements Si, Cr, Mo and V. It contains the minimum composition, including the lowest carbon content for good weldability, with no undissolved carbides. Notch sensitivity is extremely low.
(Q27a, T24e; AY, *Si, Cr, Mo, V*)

1350-Q.* Titanium, Its Properties and Design Potentials. H. E. Barkan. *Electrical Manufacturing*, v. 62, Oct. 1958, p. 100-109, 272, 274, 276, 278.

Current structural and electronic uses for Ti and its alloys. Potential uses based on exceptional properties in design of components and equipment. Properties of standard and new alloys, with fabrication data supported by charts and graphs. (Q-general, G-general, 17-51, 17-57; Ti-b)

1351-Q.* Effect of Heating and Cooling on the Mechanical Properties of an Alloy Steel. A. S. Kenneford and T. Williams. *Institution of Mechanical Engineers, Proceedings*, v. 171, no. 30, 1957, p. 823-828.

Alloy steel to specification B.S. En29 investigated. On rapid cooling from a temperature above the critical range the steel possessed poor mechanical properties (low

yield and tensile strengths) at all temperatures down to the commencement of martensite formation at about 300° C., below which there was a sudden increase in yield and tensile strengths accompanied by a marked decrease in ductility. Relation between these mechanical properties and the incidence of cracking after repeated heating and rapid cooling.
(Q27a, Q23p, 2-64; AY)

1352-Q.* Stress-Relaxation Behavior of Chromium-Molybdenum and Chromium - Molybdenum - Vanadium Bolting Materials. J. A. Stafford and M. G. Gemmill. *Institution of Mechanical Engineers, Proceedings,* v. 171, no. 31, 1957, p. 834-842.

Tests on two steels to investigate essential differences between testing under constant load, constant total strain, and a commonly used "weight bar" method that is intermediate between the two. Constant strain results do not entirely support the usual strain-hardening and time-hardening theories. Suggests how relaxation data may be used for design purposes.
(Q23a; AY, *Cr, Mo, V*)

1353-Q.* Study on the Changes of the Properties of Steel Caused by Low-Temperature Quenching. Pt. 4. Improvement of Notch Fatigue Strength. Tadakazu Sakura, Tadashi Kawasaki and Yukizumi Kita. *Japan Society of Mechanical Engineers, Bulletin,* v. 1, no. 2, 1958, p. 114-119.

The effect of low-temperature quenching. Increase in fatigue strength of steel is more notable in notched specimens than in unnotched. 14 ref. (Q7a, J26; ST)

1354-Q.* Microstructural Observation on Fatigue Fracture of Metals. Shigeo Owaku and Seinoshin Morikawa. *Japan Society of Mechanical Engineers, Bulletin,* v. 1, no. 2, 1958, p. 129-133.

Fatigue fracture, initially rough, becomes smooth under repeated stress; the metal dust produced is sintered, and in the case of high-carbon steel quench-hardened, under friction heat, into a very hard material. In this process, if air enters into the crack, the color of fracture surface will turn to black owing to the influence of friction heat; otherwise it would be white.
(Q7, Q26)

1355-Q.* Fatigue of Low Carbon Steel at Elevated Temperature. Toshio Nishihara, Shuji Taira, Kichinosuke Tanaka, Tyoichi Koterazawa and Yoshisato Azuma. *Japan Society of Mechanical Engineers, Transactions,* v. 24; July 1958, p. 445-452.

Tests made under the condition of constant deflection with a rotating-type machine at temperatures of 450, 300° C. and at room temperature by applying stress cycles in the range from 170 to 3000 cycles per min. At 450° C., frequency of repeated cycles has the following influence on fatigue life. Under a definite stress amplitude, the number of cycles to fracture is less at lower frequency and time to fracture has a definite value irrespective of frequency. (Q7a, 2-62; CN-g)

1356-Q.* Cumulative Fatigue Damage at Elevated Temperature. William K. Rey. *National Advisory Committee for Aeronautics, TN 4284,* Sept. 1958, 53 p.

Tests on heat treated SAE 4130 alloy steel. S-N curves at room temperature, 400 and 800° F. obtained. Results compared with theoretical analysis. 37 ref.
(Q7f; SS, 2-62)

1357-Q.* Rate of Fatigue-Crack Propagation in Two Aluminum Alloys. Arthur J. McEvily, Jr., and Walter Illg. *National Advisory Committee for Aeronautics, TN 4394,* Sept. 1958, 46 p.

Sheet specimens, 2 in. and 12 in. wide, of 2024-T3 and 7075-T6 Al alloys were tested in repeated tension with constant-amplitude loading. Stresses ranged up to 50,000 psi. based on the initial area. Good agreement between the results and predictions was found. 11 ref.
(Q26q, Q7; Al-b)

1358-Q.* A Phenomenological Theory for the Transient Creep of Metals at Elevated Temperatures. Elbridge Z. Stowell. *National Advisory Committee for Aeronautics, TN 4396,* Sept. 1958, 31 p.

Theory of high-temperature behavior of any metal is based on assumption that the metal exists in two phases, each with its own elasticity and viscosity. Experimental work on Al, gamma-iron, Pb and 7075-T6 Al alloy agrees with theory. 10 ref. (Q3; Fe, Al, Pb)

1359-Q.* Fatigue of Structural Materials at High Temperature. B. J. Lazan. *North Atlantic Treaty Organization, AGARD Rept. 156,* Nov. 1957, 27 p.

Engineering factors important in high-temperature fatigue tabulated.

Effects of various environmental conditions are generalized when justified by prior work. Effects of mean stress, alternating stress, temperature and stress concentration. Nature and general significance of creep phenomena which occur under various combinations of cyclic stress and mean stress. Increasing importance of resonant vibrations as a cause for fatigue. Roles of damping, elasticity and conventional fatigue properties analyzed to provide criteria for judging resonance fatigue strength. Relative importance of these properties illustrated by examples. 28 ref. (Q7, 2-62)

1360-Q.* Chromium Gives Stainless Properties to Iron-Aluminum Alloys. B. King, J. J. Mueller, N. N. Ida and F. G. Tate. *SAE Journal,* v. 66, Oct. 1958, p. 48-52.

Undesirable properties of Fe-Al alloys can be rectified by adding a sizable amount of Cr. This eliminates the superlattice as a source of difficulty. Cr also contributes corrosion resistance. Small quantities of other elements are also added to impart specific characteristics to the alloys. Ti, Si, Ta, Mo and Be are thought to promote high-temperature strength and good creep properties. (Q-general, 2-62, 2-60; Fe, *Al, Cr,* SGA-g)

1361-Q.* Scratch Hardness. Pt. 1. Relation to Cold Working. Tomiya Sutoki and Takeo Hikage. *Tohoku University, Science Reports of the Research Institutes,* v. 10A, no. 2, p. 85-96.

Scratch hardness was examined on polycrystals and single crystals of several metals. A law similar to Meyer's for indentation hardness held good between the load and scratch width. Change in scratch width with cold working was very small due to the heat evolved during scratching. Scratch hardness, contrary to Tammann's interpretation, is related to the annealed state rather than to the severely hardened state of a metal. 11 ref. (Q29d, 3-68)

1362-Q.* Scratch Hardness. Pt. 2. X-Ray Investigation of Structural Change. Tomiya Sutoki and Koichi Nakajima. *Tohoku University, Science Reports of the Research Institutes,* v. 10, Aug. 1958, p. 269-275.

Structural change due to scratching or indenting Al and Ag studied by X-ray analysis. Scratch hardness appears to be related to the annealed state. (Q29d; Al, Ag)

1363-Q.* On Young's Modulus and Grain Size in Nickel-Copper Alloys. Yuki Shirakawa and Ken'ichi Numakura. *Tohoku University, Science Reports of the Research Institutes,* v. 10A, no. 2, 1958, p. 110-119.

Young's modulus and grain size were measured on ten types of polycrystalline ferromagnetic Ni-Cu alloys annealed at 700, 800, 900, 1000 and 1100° C. An empirical relation was found between Young's modulus E and the average area of crystal grains S. Young's modulus versus composition curves for alloys with the same grain size were not always similar to one another, but every curve showed a minimum. (Q21a, M27c; Ni, Cu)

1364-Q.* Modes of Deformation Leading to Fracture of Metals: A Review of Progress to January 1958. R. Doldon and R. F. Lumb. *United Kingdom Atomic Energy Authority, IGRO-TN/C-919,* 1958, 7 p.

Certain crystals of polycrystalline super-purity Al specimens deformed in tension exhibit a banded slip surface. The stress axis of these crystals is <123>. Suitability of microradiography for investigating the effect of strain rate and temperature on the formation and initial propagation of cavities instigated by deformation. 14 ref. (Q26, Q24; Al-a)

1365-Q. Iron-Aluminum-Base Alloys for Reactor Components. William A. Maxwell. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/707, 1958, 18 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Properties of experimental alloy containing 7.5% Al, 5% Cr, 1% Cb, ½% Ti and 86% Fe. Tensile tests indicate ample ductility for carrying out manufacturing operations incidental to fuel element fabrication. 9 ref. (Q27a, T11g, 17-57; Fe, Al)

1366-Q. Tensile Properties of Pure Plutonium and Some Aluminum-Plutonium Alloys. H. R. Gardner, C. H. Bloomster and J. M. Jefferes. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1081, 1958, 9 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Objective was to determine mechanical and physical properties of cast fuel rods suitable for fuel elements. Ultimate strength, yield strength, modulus of elasticity, modulus of resilience, diamond pyramid hardness and density. Stress-strain relationships. (Q27a, T11g; Pu, Al-b)

1367-Q. Performance of Metals During Six Years Service in the Materials Testing Reactor. M. H. Bartz. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1878, 1958, 23 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

AISI Type 347 stainless steel, Al alloy 1100, Al alloy 356 and QMV Be as reactor core materials. Performance of fuel elements and control rods considered. (Q-general, 2-67; W11p, 17-57; SS, Al-b, Be)

1368-Q. Effects of Irradiation on the Structural Materials in Nuclear Power Reactors. J. C. Wilson. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1978, 1958, 26 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Tensile and notch-impact properties of a number of steels tabulated as a function of neutron dose and irradiation temperature. Sensitivity to dose and irradiation temperatures varies in different steels whose nominal properties are similar in the absence of irradiation. 26 ref. (Q27a, Q6n, 2-67, W11p, 17-57; ST)

1369-Q.* (French.) **Note on the Modulus of Elasticity of Some Light Alloys.** Claude Mascre and Andre Lefebvre. *Fonderie,* no. 150, July 1958, p. 302-304.

LeRolland-Sorin elasticimeter was used to measure modulus of elasticity of Al-Cu, Al-Mg and Al-Si alloys. Al-Mg and Al-Cu specimens, regardless of analysis, had almost same modulus, but in Al-Si alloys this measurement increased with increase in Si content. Heat treating was found to have no appreciable influence on modulus of any of alloys studied, but modulus of chill-cast specimens was slightly higher than that of sand-cast. Study also confirmed indirectly absence of relationship between modulus of elasticity and other mechanical properties. (Q21a, 2-60, 2-64; Al-b)

1370-Q.* (German.) **"Contraction Work" in Rupture as a Characteristic of Materials.** L. Gillemot and G. Sinay. *Acta Technica,* v. 22, no. 1-2, 1958, p. 149-173.

Formula derived for the contraction work (i.e., work of volume unity at the reduced section in rupture). Contraction work of steel A60.11 computed as 41.0 mkg. per cc.; determined empirically as 47.3-51.0 mkg. per cc. Contraction work tests of CrV 135 steels, Sn-Zn alloys, Al-Si, Al-Fe, Al-Zn and Cu-Ni alloys. 6 ref. (Q26; SS-b, Sn-b, Al-b, Cu-b, Zn-b, Ni-b)

1371-Q.* (German.) **New Heat Resistant Pearlite-Ferrite Steels.** Karlheinz Werner. *Bergakademie,* v. 10, May-June 1958, p. 310-315.

Experiments on strength of heat resistant Cr, Mo and Cr-Mo steels, as influenced by service temperature. In testing for service temperatures up to 350° C., it is sufficient to determine the elastic limit or the 0.2% elongation; for the range 400 to 475° C., creep limit is found; for more than 500° C., the long-time strength and long-time elastic limit should be determined. 12 ref. (Q-general, 2-61; SS, *Cr, Mo*)

1372-Q.* (German.) **Toughness of High-Speed Steels.** H. D. Weckener. *Industrieblatt,* v. 58, Sept. 1958, p. HT69-HT73.

Determination of toughness by measuring the ultimate deformation before fracture of the high speed steel class DMo5 (0.81% C, 4.11% Cr, 6.65% W, 2.01% V, 4.61% Mo). Toughness curve declines sharply. (Concluded.) 14 ref. (Q23r; TS-m)

1373-Q.* (German.) **Comparison Between Vickers and Knoop Hardness Testing Methods.** R. Chatterjee-Fischer and O. Schaaber. *Industrieblatt,* v. 58, Oct. 1958, p. HT80-HT82.

Advantages of rhombus-shaped Knoop-diamond: Small impression affects smaller zone in cross direction than square impression by Vickers diamond; important for hardness tests above cross-section of very thin layers. Determination of hardness requires only measurement of long diagonal; shifting of measuring head, with resulting loss of time, is superfluous. Sources of errors in reading measurements of diagonals are reduced since long diagonal in Knoop diamond is 2.8 times the size of Vickers' diagonal. (Q29c)

1374-Q.* (German.) **Importance of Tantalum Carbide in Hard Metal Production.** Miroslav Petrdlik and Vladimir Dufek. *Neue Hütte,* v. 3, Aug. 1958, p. 483-489.

Cutting capacity, flexural breaking strength, hardness, specific gravity, resistivity, resistance to oxidation and influence of type of TaC addition in base mixtures. 12 ref.
(Q-general, P-general, SGB-g, Ta, C)

1375-Q.* (German.) **Mutual Reaction Between Hardness and Modulus of Elasticity of Pure Metals at High Temperatures.** M. G. Losinski and S. G. Fedotow. *Neue Hütte,* v. 3, Aug. 1958, p. 489-494.

High-temperature properties of platinum, palladium, rhodium, iridium, tungsten, molybdenum, titanium, zirconium, iron, nickel, cobalt, copper and silver. 10 ref. (Q21a, Q29n; Pt, Pd, Rh, Ir, W, Mo, Ti, Zr, Fe, Ni, Co, Cu, Ag)

1376-Q.* (German.) **Fatigue Tests of Brazed Pipe Connections.** J. Colbus. *Schweissen und Schneiden,* v. 10, Aug. 1958, p. 312-316.

Fatigue tests of brazed joints on bicycle frames. Tubes were of cold drawn steel, 35 mm. with 1.5-mm. wall and 23.5-mm. with 1.1-mm. wall. Test apparatus consisted of high-frequency pulsator, optical dynameter and photo-electric amplitude regulator. Variation in strength of joints in different locations explained by variation in stress. Ag-brazed joints proved superior to Cu-brazed. 4 ref.
(Q7; ST, 7-52)

1377-Q.* (German.) **Influence of Temperature and Speed of Deformation on the Deformation Resistance of Some Steels.** V. Valorinta. *Werkstattstechnik und Maschinenbau,* v. 48, Aug. 1958, p. 452-456.

Deformation resistance decreases with increased deformation temperature and increases with the deformation speed. In the first case, a transitory sudden increase of deformation resistance was observed within the temperature range of recrystallization, the more accentuated the lower the deformation speed. 4 ref. (Q24, 2-61, 3-67; ST)

1378-Q.* (Italian.) **Size and Notch Effects in Fatigue Problems.** Antonio Erra. *Ingegneria Meccanica,* v. 7, June 1958, p. 41-46.

Size and notch effects in fatigue tests on both smooth and notched specimens described in light of published experimental results. Notch sensitivity of steels defined; factors which influence it. 12 ref.
(Q23s, Q7; ST)

1379-Q.* (Italian.) **Fatigue Tests Under Increasing Load on a Steel With Different Types of Surface Finish.** Ugo Rossetti. *Ingegneria Meccanica,* v. 7, June 1958, p. 47-56.

Rotary bending fatigue tests under increasing load in specimens of UNI 38 NCD 4 steel with five degrees of surface finish, roughness of which was measured in the longitudinal plane. Prot and Locati methods, as well as method of direct calculation for establishment of fatigue limits; results compared. Data obtained by tests analyzed statistically. Relationship between roughness and fatigue limit. 13 ref.
(Q7, S14; ST)

1380-Q.* (Italian.) **Comparison Between Degrees of Roughness of Metal Surfaces Finished by Different Methods and the Fatigue Limit of the Material.** Giovanni Perotti. *Ingegneria Meccanica,* v. 7, June 1958, p. 57-60.

Surfaces of specimens of UNI 38 NCD 4 steel were finished by hand polishing with emery cloth, finish turning on an engine lathe, grinding and shot-peening. Surface roughness was measured; all specimens were subjected to rotary bending fatigue tests. Two conclusions were: (1) in specimens of equal size and shape, the one having lesser surface roughness has greater fatigue resistance; (2) type of finish machining performed (i.e., whether chip removal is involved or not) and direction of marks left by finishing operation also influence fatigue limit. 9 ref. (Q7a, S14)

1381-Q.* (Italian.) **Fatigue Limit of Light Alloys.** Lamberto Mori. *Ingegneria Meccanica,* v. 7, June 1958, p. 63-72.

Review of dynamic characteristics of principal Al alloys suitable for plastic working. Specimen shape, size, surface finish and fatigue testing equipment used in rotary bending tests. Effect of notching on fatigue resistance and on degree of scatter of results and shape of fatigue curve. 10 ref. (Q7a; EG-a38)

1382-Q.* (Japanese.) **Studies on Sintered Aluminum Compacts.** G. Ito and F. Sawayanagi. *Scientific Research Institute, Reports, Komagome, Bunk-*

yo-Ku, Tokyo, Japan, v. 34, no. 4, 1958, p. 266-275.

Specific gravity, hardness, tensile strength, elongation, formability, microscopic tests and growing of crystals of sintered Al powder. Samples are made by Irmann's method. The finer the grain, the greater the hardness; best Vickers hardness is 72, tensile strength 24 kg. per sq. mm. If Cu (4%) and Mg (1%) are added, hardness is 122, tensile strength is 35 kg. per sq. mm. and elongation is 1%. (Q-general, Al, *Cu, Mg,* 6-72)

1383-Q.* High-Temperature Metallurgy Today. L. P. Jahnke and R. G. Frank. *Metal Progress,* v. 79, Nov. 1958, p. 77-82.

Surveys most promising areas for high-temperature development and gives the best alloys among the light metals and steels. (Q24, Q-general, 2-62, 17-51; SGA-h)

1384-Q.* (English.) Brittle Fracture. The Problem as it Exists Today. G. M. Boyd. *Metalen,* v. 13, June 15, 1958, p. 200-205.

Brittle fracture in welded steel structures. Appearances and characteristics of brittle fracture. Work and energy relation in the initiation of propagation of brittle fracture. (To be continued.) 10 ref. (Q26s; ST, 7-51)

1385-Q.* (English.) Brittle Fracture. The Problem as it Exists Today. Pt. 2. G. M. Boyd. *Metalen,* v. 13, June 30, 1958, p. 224-228.

Six prominent tests commonly used in assessing the transition range and fracture characteristics. Charpy, Tipper and Robertson test curves for mild steels showing variations in fracture behavior as indicated crystallinity and energy absorption. Effect of welding on brittle fracture. 4 ref. (Q26s; ST, 7-51)

1386-Q.* (German.) Creep Behavior of Aluminum at Temperatures up to 300° C. K. Wellinger, E. Keil and G. Maier. *Aluminium,* v. 34, Aug. 1958, p. 458-463.

Creep tests were made on alloys Al 99.5 F7, AlMgSi 1 F32 and GK-Al-Si 10 Mg at temperatures up to 300° C. and times up to 10,000 hr. Extrapolation of the probable times to rupture for those loads which produce 1% permanent set in 10,000 hr. indicated that the time to failure for the same elongation varied widely with the alloy composition, heat treatment and temperature. Possibility of rapid test method. (Q3m, 2-60, 2-61, 2-64; Al-b, *Mg, Si*)

1387-Q. High Temperature Metals. *Metal Industry,* v. 93, Oct. 10, 1958, p. 309-310.

Mechanical and physical properties, refractory metals and high-temperature techniques presented at a symposium on metals and alloys above 1200° C. at Oxford University. (Q-general, P-general; 2-62, SGA-h)

1388-Q.* (Japanese.) Studies on Casting Stress. Pt. 2. Kenji Chijiiwa. *Japan Foundrymen's Society, Journal,* v. 30, July 1958, p. 531-535.

Casting stresses of ordinary inoculated and spheroidal cast irons compared using ring-shaped specimens with an arm across the diameter. Casting stresses were lowest for ordinary and highest for spheroidal cast irons. Castings with a boss in the center of the arm were used to investigate relation between ring and the castings stressed. The stresses became almost negligible when volume surface areas ratios of the ring and boss were equal. (Q25, E25; CI, CI-r)

1389-Q. (Polish.) Investigations on Creep Phenomena Based on Tensile Tests. Jerzy Wantuchowski. *Archiwum Hutnictwa,* v. 3, no. 3, 1958, p. 201-226.

Creep tests under a constant load with a special apparatus. Relationship between true tension, ideal work hardening and velocity of deformation. (Q3)

1390-Q.* (Russian.) Influence of Thermo-Mechanical Treatment in Ladle on Impact Toughness of Structural Alloy Steel. E. N. Sokolkov, L. V. Smirnov and S. N. Petrova. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 276-280.

Study of industrial steel type 37XHZA and 35XGCA in shape of cross bar 20 × 20 × 200 mm. Heating to 1150° in ladle followed by 4-hr. annealing at 550° gives impact toughness of 10.7 and hardness of 30; heating to 1150° in ladle, quenching, annealing at 550° for 4 hr., gives impact toughness of 4.7 and hardness of 25. 4 ref. (Q6, Q29, D9m, 2-64; AY)

1391-Q.* (Russian.) Influence of Cold Hardening and Aging on Resistance to Rupture and Plasticity of Steel at

—196° C. E. M. Shevandin and R. E. Reshetnikova. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 293-303.

Investigation on polished as well as cut specimens of low-alloy steel 30 mm. thick in hot rolled condition. On none of the tested polished specimens was there any brittle fracture. By cold hardening, beginning with 10% and higher, resistance to rupture continuously rises. Subsequent aging of polished specimens lowers their resistance to rupture. Mechanical aging of cut specimens at 250° also lowers their resistance to rupture. This is accompanied by a lessening of contraction in both specimens. 16 ref. (Q23, Q26s, 2-64, 3-68; AY)

1392-Q.* (Russian.) **Characteristics of Gradual-Monotonic Process of Plastic Deformation of Steel I.** L. G. Afendin. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 304-310.

Two-stage process of plastic deformation of structural steel at room temperature. The transition from one to another stage of plastic deformation does not alter the direction of the main axis of deformation. However, during monotonic transition the axial directions changed. In these changes there was observed an anisotropy in the mechanical properties. 6 ref. (Q24, 3-72; ST)

1393-Q.* (Russian.) **Influence of Heating Temperature on Mechanical Properties of Cast Iron With Spheroidal Graphite.** S. G. Guterman and G. A. Pisarenko. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 311-314.

Effect of heating temperature on high-strength iron with redistributed phosphorus. Iron melted in induction furnace of 200-kg. capacity, and treated in ladle with 0.5% Mg. Increasing heating temperature to 950° leads to remarkable growth in plastic properties of iron and an even greater increase in its impact toughness. Increase above 950° does not result in any further changes. 6 ref. (Q-general, E25q, 2-60; CI, *P, Mg*)

1394-Q.* (Russian.) **Influence of Preliminary Cold Deformation on Creep.** G. I. Nosova and V. M. Rosenberg. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 321-325.

Experiments conducted on alloys of Fe-Ni-Cr-Co with varying amounts of Co. Creep was tested by deformation bending. By simultaneous action of temperature and pressure, the strengthening of preliminarily deformed objects takes place much more rapidly then if only subjected to temperature increase. 6 ref. (Q3, Q5, 2-61, 3-68, 3-74; Co, Cr, Fe Ni)

1395-Q. Diesel Engine Cylinder Bore Wear. Pt. 3. R. T. Rolfe. *Allen Engineering Review,* no. 39, Oct. 1958, p. 24-33.

Behavior of gray cast Fe with 2.5 to 4.5% C. (Q9, W11j; CI-n)

1425-Q. Effect of Preloading on the Yield Point of Iron. M. M. Hutchinson and N. Louat. *Acta Metallurgica*, v. 6, Jan. 1958, p. 8-12.

Measurement of increase in yield stress in Fe caused by preloading below the yield point. 7 ref. (Q23b, 3-70; Fe)

1426-Q. Polyslip in Polycrystals. U. F. Kocks. *Acta Metallurgica*, v. 6, Feb. 1958, p. 85-94.

Simultaneous glide of dislocations in many slip systems of each grain (polyslip) may cause plastic deformation of cubic polycrystals. Theory checked with high-purity Al samples. 30 ref. (Q24a, M26b; Al-a)

1427-Q. Elastic Properties of Metals and the Resonating Valence Bond Theory. G. Bergman. *Acta Metallurgica*, v. 6, Feb. 1958, p. 110-115.

Elastic properties of metals with cubic close-packed and hexagonal close-packed structures derived on the basis of a modification of Pauling's theory. 7 ref. (Q21, M25)

1428-Q. Influence of Microstructure on the Carbon Damping Peak in Iron-Carbon Alloys. Philip Stark, B. L. Averbach and Morris Cohen. *Acta Metallurgica*, v. 6, Mar. 1958, p. 149-155.

Internal friction peak due to stress-induced migration of carbon in b.c.c. iron is influenced by grain size and intercarbide distance. 12 ref. (Q22; Fe, C, 2-69)

1429-Q. Deformation Twinning in Silver-Gold Alloys. H. Suzuki and C. S. Barrett. *Acta Metallurgica*, v. 6, Mar. 1958, p. 156-165.

Deformation twinning of single crystals at low temperatures. Upper temperature range for twinning decreases with increasing Au content. 7 ref. (Q24b, Ag-b, *Au*, 2-61)

1430-Q. A Theory of the Origin of Fatigue Cracks. N. F. Mott. *Acta Metallurgica*, v. 6, Mar. 1958, p. 195-197.

Model given to explain how a slip band can develop into a crack if dislocations in the band are free to move backward and forward. 18 ref. (Q7, Q26r)

1431-Q. Plastic Behavior of Copper Crystals Containing Zinc in the Surface Layer. M. A. Adams. *Acta Metallurgica*, v. 6, May 1958, p. 327-338.

Critical shear stress measurements showed that a lightly zincified surface strengthens a Cu crystal more effectively than a heavily zincified surface; removal of the surface layer from a lightly zincified crystal caused a large decrease in strength and disappearance of the yield point. 11 ref. (Q23, 3-69; Cu, *Zn*)

1432-Q. Investigation of the Rate Controlling Mechanism for Plastic Flow of Copper Crystals at 90 and 170°K. H. Conrad. *Acta Metallurgica*, v. 6, May 1958, p. 339-350.

Investigation to determine whether the intersection of dislocations is the rate controlling process in low-temperature deformation. 32 p. (Q24; Cu)

1433-Q. Adiabatic Young's Modulus and Internal Friction of Superconducting Lead and Tin. B. Welber and S. L. Quimby. *Acta Metallurgica*, v. 6, May 1958, p. 351-359.

Thermodynamics of the superconducting transition. 31 ref. (Q21a, Q22, P15g; Pb, Sn)

1434-Q. Creep of Aluminum Under Extremely Small Stresses. J. G. Harper, L. A. Shepard and J. E. Dorn. *Acta Metallurgica*, v. 6, July 1958, p. 509-518.

High-temperature creep of Al controlled by two different mechanisms —grain-boundary shearing at higher stress, motion of dislocations at lower stress. 15 ref. (Q3n; Al, 2-62, 3-66)

1435-Q. Mechanical Behavior of Microcrystals. W. W. Webb. and W. D. Forging. *Acta Metallurgica*, v. 6, July 1958, p. 462-469.

Bend tests on small crystals and whiskers of beta-manganese, Mn_5Si_3, alpha-Si_3N_4, alpha-Al_2O_3, Cr_3O_4, Cr_2N, Cr and Fe_3C. All showed high elasticity and strength near theoretical values. 27 ref. (Q-general; Si, *Mn*, Al, Fe, Cr, O, C, N, 14-61)

1436-Q. Temperature Dependence of the Flow Stress on an Age-Hardened Alloy. A. Kelly and C. Chiou. *Acta Metallurgica*, v. 6, Sept. 1958, p. 565-571.

Critical resolved shear stress of single crystals of an Al-Cu alloy between 77 and 373° K. Reversible change of flow stress varies with temperature in a manner similar to that shown by pure Al crystals in that, after elimination of the elastic constants with temperature, it is approximately constant at temperatures above 160° K. but increases at lower temperatures. 27 ref. (Q24; Al-b, Cu, 14-61, 2-61)

1437-Q. Influence of Elastic Strains on the Recovery of Cold Worked Copper. *Acta Metallurgica*, v. 6, Oct. 1958, p. 613-619.

12 ref. (Q22n; Cu, 3-68)

1438-Q. Solute Hardening of Close-Packed Solid Solutions. P. A. Flinn. *Acta Metallurgica*, v. 6, Oct. 1958, p. 631-635.

Effect of local order, segregation of solute atoms on strength of Ag-Au, Cu-Au, Cu-Zn alloys. 21 ref. (Q27a, M26; Ag, Au, Cu, Zn, 9-69, 14-67)

1439-Q. Deformation and Fracture of Alpha-Iron at Low Temperatures. W. D. Biggs and P. L. Pratt. *Acta Metallurgica*, v. 6, Nov. 1958, p. 694-703.

Stress for slip, twinning and cleavage of single crystals at −183° C. Yield point at −183° C. influenced by prior twinning at room temperature. 34 ref. (Q24, Q23b, Q26n; Fe, 14-61, 1-63)

1440-Q. Influence of Grain Size on the Stored Energy and Mechanical Properties of Copper. L. M. Clarebrough, M. E. Hargreaves and M. H. Loretto. *Acta Metallurgica*, v. 6, Dec. 1958, p. 725-735.

At low strains, flow stress is higher, stored energy greater for fine-grained Cu. At higher strains, both grain sizes exhibit same values. 25 ref. (Q-general, 2-59; Cu)

1441-Q. Compound Semiconductors. H. P. R. Frederikse. *Journal of Metals*, v. 10, May 1958, p. 346-350.

Survey of mechanical, electrical, optical, magnetic and thermal properties. 21 ref. (Q-general, P-general; EG-j, 14-68)

1442-Q. Ductile Ceramics—a High-Temperature Possibility. Earl R. Parker, J. A. Pask, J. Washburn, A. E. Gorum and W. Luhman. *Journal of Metals,* v. 10, May 1958, p. 351-353.

Cubic ceramic crystals (for example, NaCl, CsBr, AgCl, KCl, MgO) possess substantial amounts of ductility. Purity and environment affect brittleness. 18 ref.

(Q23p, 2-66, 3-69; Ag, Cs, Na, K, Mg, NM-f, SGA-h)

1443-Q. Whiskers—Their Strength. George A. Hoffman. *Journal of Metals,* v. 10, Sept. 1958, p. 591-595.

Tiny, perfect, crystal filaments, with strength approaching the theoretical limit of atomic cohesion, may be the building-blocks of the astronauts. 7 ref. (Q27; 14-61)

1444-Q. High-Purity Cobalt. Its Properties. F. R. Morral. *Journal of Metals,* v. 10, Oct. 1958, p. 662-664.

Hardness data and microstructure of zone-refined Co. 9 ref.

(Q-general, M27; Co)

1445-Q. Fracture of Zinc Crystals in Bending. John J. Gilman. *Metallurgical Society of AIME, Transactions,* v. 212, June 1958, p. 293-294.

Glide plane of an edge dislocation is a weak region. 4 ref.

(Q26, Q5; Zn)

1446-Q. Microcrack Formation in Hydrogen Embrittled Zirconium. A. P. Young and C. M. Schwartz. *Metallurgical Society of AIME, Transactions,* v. 212, June 1958, p. 309-310.

Strain rate effect in neighborhood of hydride precipitate in tensile impact samples. (Q26p, 3-68; Zr-b, *H*)

1447-Q. Elevated Temperature Characteristics of Internally Oxidized Titanium-Cerium Alloys. R. H. Hiltz, Jr., and N. J. Grant. *Metallurgical Society of AIME, Transactions,* v. 212, June 1958, p. 383-387.

Tested for rupture life at 426, 538 and 648° C. Improvement in strength over that of pure Ti.

(Q3q, R2s, 1-62; Ti-b, *Ce,* 1-60)

1448-Q. Work Hardening in the Latent Slip Directions of Alpha Brass During Easy Glide. W. L. Phillips, Jr., and W. D. Robertson. *Metallurgical Society of AIME, Transactions,* v. 212, June 1958, p. 406-412.

Stress-strain curves obtained for single crystals in tension and in shear. 29 ref.

(Q23a, Q24a, Q25n, J23; Cu-n, 14-61)

1449-Q. Effect of Hydrogen on Some Mechanical Properties of a Titanium Alloy Heat Treated to High Strength. H. A. Robinson, P. D. Frost and W. M. Parris. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 464-469.

Embrittlement of complex Ti-Mn alloy influenced by H_2 and heat treated strength. 7 ref.

(Q-general, 2-64, 2-69; Ti-b, *Mn, H*)

1450-Q. Internal Friction and Young's Modulus of Hexagonal and Cubic Cobalt. M. E. Fine and E. H. Greener. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 476-478.

9 ref. (Q21a, Q22, 2-62; Co)

1451-Q. Tensile Properties of Ti-20U and Ti-30U. H. A. Robinson, O. J. Huber and P. D. Frost. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 485-486.

A larger spread shown between yield and ultimate tensile strength than in heat treatable alpha-beta Ti alloys. (Q27; Ti-b, *U*)

1452-Q. Effect of Oxygen on Impact Transition of Iodide Titanium. E. H. Rennhack. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 487-489.

6 ref. (Q6n; Ti-b, *I,* 5-59)

1453-Q. Hydrogen in Titanium Aluminum Alloys. L. W. Berger, D. N. Williams and R. I. Jaffee. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 509-513.

Al increases H_2 solubility of alpha phase, thus increases impact embrittlement resistance. 7 ref.

(Q-general, M24b, M24c, 2-60; Ti-b, *Al, H, O, C*)

1454-Q. Plastic Flow of Molybdenum at Low Temperature. G. A. Alers, R. W. Armstrong and J. H. Bechtold. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 523-528.

Mo ductile in compression down to −196° C. Yield strength increases with decreased temperature. 12 ref.

(Q23, 2-62, 1-54; Mo)

1455-Q. Hydrogen, Crack Initiation and Delayed Failure in Steel. H. H. Johnson, J. G. Morlet and A. R. Troiano. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 528-536.

Delayed failure occurs by controlled initiation and growth of a crack. Incubation period of a crack which results from stress-induced

diffusion of H_2 to point of crack initiation measured. 14 ref.
(Q26q, 2-60, 3-66; ST, *H*)

1456-Q. Creep Characteristics of a Magnesium Single Crystal From 78 to 364° K. H. Conrad and W. D. Robertson. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 536-542.

Incremental loading creep tests conducted in tension and direct shear. Creep curves were transient in character and exhibited waves or periodic behavior. 23 ref.
(Q3, 2-63; Mg, 14-61)

1457-Q. Acoustical Study of Low Temperature Aging in Al-4.2% Cu. M. E. Fine and Charles Chiou. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 553-557.

While Gunier-Preston zones grow at room temperature, Young's modulus increases. Activation energy. 13 ref. (Q21a, N7a, 1-67; Al-b, *Cu*)

1458-Q. Role of Rate History Effects in the Calculation of Creep Behavior. J. D. Lubahn. *Metallurgical Society of AIME, Transactions,* v. 212, Aug. 1958, p. 557-563.

Tests, where strain rate in tensile test changed, showed a small rate-history effect to exist. If effect is neglected in calculation of creep behavior from tensile results, error occurs but may be neglected. 8 ref.
(Q3n, 3-69)

1459-Q. Temperature Dependence of the Yield Stress of Copper and Aluminum. W. D. Sylwestrowicz. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 617-624.

In tests on polycrystalline Cu and Al the ratio of the yield stress to the modulus of elasticity was found to be strongly dependent on temperature. 15 ref.
(Q21a, Q24, 2-61; Al, Cu)

1460-Q. Surface Deformation Differences Between Lead Fatigued in Air and in Partial Vacuum. K. U. Snowden and J. Neill Greenwood. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 626-627.
(Q7, 1-73; Pb)

1461-Q. Effect of Complexing on Mechanical Properties of Ti-6Al-3Mo Alloy. F. A. Crossley and W. F. Carew. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 630-635.

None of the more complex versions of the base alloy offers greater promise than Ti-7Al-3Mo alloy. However, some improvement in strength of the latter may follow from addition of Zr, perhaps up to 4%. 7 ref.
(Q-general, 2-60; Ti-b, *Al, Mo, Zr, Ge, Sn*)

1462-Q. Deformation of Single Crystals of Aluminum. J. M. Roberts and K. V. Gow. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 648-658.

Single crystals of Al oriented for single slip and duplex slip were deformed at 23, 300 and 600° C. at creep, normal and very rapid rates of straining. Study of the crystallography of deformation was made by optical examination of slip traces. 18 ref.
(Q24a, 2-66, 3-66; Al, 14-61)

1463-Q. Relations of High-Temperature Properties of a Ti + Al Hardened Nickel-Base Alloy to Contamination by Crucibles. R. T. Decker, John P. Rowe and J. W. Freeman. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 686-694.

Zirconium derived from melting in zirconia crucibles improved characteristics. Boron was more beneficial than Zr. 9 ref. (Q23, Q3q, 2-60, 2-62; Ni-b, *Ti, Al, Zr, B*)

1464-Q. Creep of Polycrystalline Alpha and Beta Thallium. Oleg D. Sherby. *Metallurgical Society of AIME, Transactions,* v. 212, Oct. 1958, p. 708-715.

Suggests that high-temperature creep rate is controlled by a dislocation climb process. 12 ref.
(Q3, 2-62; Tl)

1465-Q. High Temperature Deformation of Steels; a Study of Equicohesion, Activation Energies and Structural Modifications. C. Crussard and R. Tamhankar. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 718-730.

Dislocations during high-temperature intergranular and intragranular modes of deformation in Armco iron and 35-15 Ni-Cr austenite steel studied by tensile, creep and torsion tests. 30 ref. (Q24, P13a, Q27a, 2-62; Fe, SS-e, *Ni, Cr*)

1466-Q. Comparison of Creep Rupture Properties of Widdmanstatten and Equiaxed Structures of Ti-7Al-3Mo Alloy. F. A. Crossley and W. F. Carew. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 748-750.

5 ref. (Q3q, 3-71; Tl-b, *Al, Mo*)

1467-Q. Effect of Carbide Dispersion on the Strength of Tempered Martensite. A. M. Turkalo and J. R. Low, Jr. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 750-758.

Relationship between carbide spacing and tensile properties verified and extended data to finer structures using electron microscope. 13 ref. (Q27a, N7a; SS-c, *C*)

1468-Q. Fracture of Zinc-Monocrystals and Bicrystals. J. J. Gilman. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 783-791.

Small amounts of prior plastic glide and type of grain boundaries influence fracture stress. 40 ref. (Q26r, 3-71; Zn)

1469-Q. Grain Boundary Shear in Aluminum. F. Weinberg. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 808-817.

Measurements of boundary shear as function of time and effects of stress, temperature, boundary angle and added impurities. 10 ref. (Q2, 2-62, 3-69, 3-71, 3-68; Al)

1470-Q. Problem of Hydrogen Embrittlement of Iron. A. Siede and W. Rostoker. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 852-855.

H_2 depresses upper yield point and reduces yield point elongation and gives Fe strain aging kinetics; therefore, H_2 displaces C and N_2 from dislocation centers. 7 ref. (Q26s, 3-69; Fe, *H*)

1471-Q. High Temperature Properties of Nickel Alloy Powder Extrusions Containing Nonmetallic Dispersions. Eric Gregory and Claus G. Goetzel. *Metallurgical Society of AIME, Transactions,* v. 212, Dec. 1958, p. 868-874.

Stress-rupture tests on Ni-Cr alloy matrix at 1500 and 1800° F. Strength increased by oxide and carbide additions. 14 ref. (Q-general; 2-60, 2-62; Ni-b, *Cr,* AD-q40, 4-58, 6-72)

1472-Q. Residual Stresses in Welded Titanium Plates. E. F. Nippes and W. F. Savage. *Welding Journal,* v. 37, Oct. 1958, p. 433s-438s.

Effect of plate dimensions on the residual stresses produced by arc welding commercially pure and alloyed Ti plate; effect of preheat on the magnitude of longitudinal and transverse residual weld stresses in the alloyed plate; effects of cold treatment on the weld stresses in commercially pure Ti plate. (Q25h; 7-51, 4-53, Ti)

1473-Q. Correlation of Metallurgical Properties and Service Performance of Steel Plates From Fractured Ships. Morgan L. Williams. *Welding Journal,* v. 37, Oct. 1958, p. 445s-454s.

Relations between notch sensitivity, as measured by V-Notch Charpy energy criteria, service performance, chemical composition and grain size, as determined by statistical analyses of the accumulated data for 149 plates. 12 ref. (Q26, Q6, Q23s, T22g; *ST,* 4-53)

1474-Q. Toughness of Welds Evaluated Separately and in Composite. William P. Hatch, Jr., and Carl E. Hartbower. *Welding Journal,* v. 37, Oct. 1958, p. 455s-462s.

Comparison of transition curves of weld and heat-affected base metals tested separately and in combination. Findings confirm the validity and usefulness of the composite deformation-temperature transition curves for evaluating the relative toughness of weld and heat-affected base-metal structures. Simultaneous evaluation can be made of the notch toughness of weld metal and heat affected base metal from one series of test bars. 4 ref. (Q6, Q23s; ST, 4-53, 7-51)

1475-Q. Static Brittle-Fracture Initiation at Net Stress 40% of Yield. C. Mylonas, D. C. Drucker and J. D. Brunton. *Welding Journal,* v. 37, Oct. 1958, p. 473s-479s.

Static initiation of brittle fracture at low average net stress requires a great reduction of the usual ductility of steel. The criterion of brittleness of fracture initiation, whether with or without residual stresses, is a low average net stress at fracture. 18 ref. (Q26s, 3-66; ST, 4-53)

1476-Q. Further Evaluation of Ni-Cr-B and Au-18Ni Brazing Alloys. Winston H. Chang. *Welding Journal,* v. 37, Dec. 1958, p. 535s-542s.

Tensile and impact properties of brazed butt joints of AISI 347 and AISI 410. (Q27a, Q6, SS, Ni-b, Au-b, *Cr, B, Ni,* SGA-f)

1477-Q. Effects of Preheating Thermal Stress Relief and Electrode Type on Notch Toughness. L. J. McGeady. *Welding Journal,* v. 37, Dec. 1958, p. 543s-553s.

Comparative benefits in notch toughness realized through use of preheating for welding, as against thermal stress relief, or by changing from Type E6010 to Type E6016 electrode. 11 ref. (Q23s, J1a, K9, W29h; CN, 4-53)

SECTION R

CORROSION

1-R. Reaction Rate Study of the Dissolution of Low-Hafnium Zirconium in Hydrofluoric Acid Solutions. G. R. Hill and T. Smith. *First Nuclear Engineering and Science Congress,* v. 2, 1957, p. 63-69. (CMA)

The rate at which zirconium dissolves in HF solutions studied by tracer methods and found to be dependent on free acid concentrations alone. Temperature coefficient averages 3.34 k-cal. per mole for high stirring rates. The most likely mechanism of the slow step is diffusion of HF to the zirconium surface, but three others are also considered. 11 ref. (R6g; Zr)

2-R. Oxidation Behavior of Reactor Materials. R. A. U. Huddle. *First Nuclear Engineering and Science Congress,* v. 1, 1957, p. 79-89.

Attempt to develop a theory of oxidation involving principles of crystal chemistry as opposed to electronic considerations which can be applied as a basis of alloying to improve oxidation resistance. Relation to oxidation behavior of nuclear fuels, canning materials, structural metals. 15 ref. (R1h, T11, 17-57)

3-R. Comparison of Sodium, Lithium, and Lead as Heat-Transfer Media From a Corrosion Standpoint. E. E. Hoffman and W. D. Manly. *First Nuclear Engineering and Science Congress,* v. 1, 1957, p. 128-137.

Types of corrosion which are found with the various liquid-metal container-material couples; corrosion mechanism and effect of various parameters on corrosion; best alloys for use with the three coolants. 5 ref.
(R6m; Na, Li, Pb, 14-60)

4-R. Corrosion Resistant Materials—Metals and Alloys (Continued). Lester F. Spencer. *Metal Finishing,* v. 55, Nov. 1957, p. 62-68.

Rates of attack of sulphuric and nitric acid and other corrodants on stainless steels, nickel and nickel-base alloys. Influence of concentration, temperature and oxidizing capacity of acid solution. 12 ref.
(R6g; SS, Ni)

5-R. Preliminary Report on Corrosion of Low-Uranium, Zirconium-Base Alloys. A. E. Dwight and A. H. Roebuck. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5196, Oct. 1953, 30 p. (CMA)

The effects of heat treatment on the corrosion resistance of Zr-U alloys in 600° F. water vary with alloy composition. Tests on 57 compositions containing up to 9% U and some Sn, Pb, Sb, Bi, Y, Be, Ge, Cb, Ni and Al show best results with 2-6% U and 2-4% Sn. Water quenching gave best results for alloys made with crystal bar zirconium and alpha annealing the best for those made with sponge. (R4, 2-62, 2-60, 2-64; Zr, *U*)

6-R. Corrosion Behavior of Some Zirconium and Titanium-Base Boron Alloys in High-Temperature Water. D. C. Belouin and Ulrich Merton. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-UM-6, June 15, 1956, 11 p. (CMA)

Good corrosion resistance in hot water was apparent for Ti-1.75B. Adding 0.4% B to Zircaloy-2 increased the corrosion rate, which showed a transition after 1000 hr. (R4, 2-62; Zr, Ti, *B*)

7-R. Examination of Titanium Pulse Feeder Diaphragm Failure. T. M. Kegley, Jr. *U. S. Atomic Energy Commission,* CF-56-8-166, Aug. 24, 1956, 12 p. (CMA)

A diaphragm failed after 450 hr. service. One side of the diaphragm had been exposed to demineralized water and the other to a solution of UO_2SO_4. Both surfaces were covered with corrosion products, revealed by X-ray diffraction to be predominately TiO_2. Upon removal of the surface scale by brushing, the surface was found to be relatively unattacked. (R4, R6; Ti)

8-R. Examination of Recombiner Loop Specimens of Zr and Ti Alloys. M. K. Picklesimer. *U. S. Atomic Energy Commission,* CF-56-10-37, Oct. 2, 1956, 13 p. (CMA)

Samples of Ti, Zr, Zircaloy-2, Ti-6Al-4V and A-55 Ti were corroded in a recombiner loop. All showed some hydrogen pickup, especially Ti and Zr and all except Ti-6Al-4V showed recrystallization and grain growth. (R11, N3, N5; Zr, Ti)

9-R. Uniform Aqueous Corrosion of Aluminum—Effects of Various Ions. V. H. Troutner. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW 50133, June 10, 1957, 53 p.

36 ref. (R4; Al)

10-R. (Norwegian.) **High-Temperature Oxidation of Metals and Alloys.** Per Kofstad. *Teknish Ukeblad,* v. 104, Mar. 28, 1957, p. 249-254.

Oxidation of pure metals, connection between transport of ions and electrons and oxidation rate; influence of small amounts of impurities on oxidation rate; oxidation of superalloys. 27 ref. (R2h, 3-69)

11-R. (Swedish.) **Corrosion in Car Bodies.** E. Br. *Teknisk tidskrift,* v. 87, Mar. 26, 1957, p. 299-300.

Research on nonprotective "deep rust" in protected parts of the motor car; influence of alloy materials on the sheet metal's resistance against different kinds of corrosion. (R general, T21a; ST)

12-R. Corrosion in Engineering. *Corrosion Prevention and Control,* v. 4, Oct. 1957, p. 44-51.

Preventive measures. (R10)

13 R. Corrosion Engineering Research. *Corrosion Prevention and Control,* v. 4, Oct. 1957, p. 53-56.

Improved Li-based multipurpose greases; corrosive action of soluble cutting oils. (R7e; SGA-c, Li)

14-R. Cathodic Protection of Brewery Liquor Tanks. A. W. Hubbard. *Corrosion Prevention and Control,* v. 4, Oct. 1957, p. 57-58.

18-R. High Temperature Oxidation of Silicon. J. T. Law. *Journal of Physical Chemistry,* v. 61, Sept. 1957, p. 1200-1205.

(R2h; Si)

19-R. The Corrosion Engineer and His Contribution to an Economic Underground Pipeline Project. Anthony Gross. *Pipes and Pipelines,* v. 2, Oct. 1957, p. 25-31.

(R8; 4-60)

20-R. Rusting and Its Cost to Farming. E. E. White. *World Crops,* v. 9, Oct. 1957, p. 406-409.

Examples, and methods of prevention in farm equipment.
(R general, T3)

21-R. (German.) **Resistance of Aluminum to Mortars.** E. Fischer and H. Vosskühler. *Aluminium,* v. 33, Sept. 1957, p. 606-612.

Resistance to corrosive agents in building materials can be increased by surface protection with lacquers, bituminous paints or greasing. 3 ref. (R6n; Al)

22-R. (German.) **Corrosion Resistance of Austenitic Chromium-Nickel Steels.** W. Katz. *Draht,* v. 8, Aug. 1957, p. 317-321.

Variations in composition permit adaption for many applications. 20 ref. (R general, 2-60; SS, *Cr, Ni*)

23-R. (German.) **White Scale on Zinc-Plated Products. Its Prevention.** Karl Daeves. *Draht,* v. 8, Aug. 1957, p. 334-335.

White scale is a mixture of basic zinc carbonate and zinc oxide, caused by continued exposure to water. Sealing in oil paper and dipping in chromate solutions previous to shipping or storing was not satisfactory. Sufficient ventilation and prevention of excessive temperature fluctuation in storage rooms gave good results. 13 ref. (R2q; Zn, 8-62)

24-R. (Japanese.) **Effect of Manganese Dioxide on the Corrosion of Zinc Plates in Dry Cells.** K. Ninomiya and K. Sasaki. *Electrochemical Society of Japan, Journal,* v. 25, June 1957, p. 325-328.

Corrosion by managanese dioxide, oxygen and various metal ions. (R6; Zn)

25-R. (Russian.) **Texture of Iron Scale. Pt. 10. Texture of Ferrous Scale.** V. I. Arkharov and M. I. Simonova. *Fizika Metallov i Metallovedenie,* v. 4, no. 2, 1957, p. 278-290.

Oxidation conditions; measurement of crystalline lattice of ferrous oxide; X-ray photographs of ferrous oxide crystals. 8 ref. (R1h, R2q; Fe)

26-R. (Russian.) **Magnetostriction Vibrator Testing of the Effect of Shot Peening on the Cavitation-Corrosion Resistance of Metals.** L. A. Glikman and Yu. E. Zobachev. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 38-41.

Investigation did not disclose positive influence of shot peening on resistance to cavitation corrosion. 5 ref. (R2m, G23n)

27-R. (Russian.) **Corrosion Resistance of Metals to Natural Gas Containing Sulphuric Acid.** V. M. Nikiborova and N. A. Reshetkina. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 55-62.

Chromium plated steel and cast iron resist corrosion, while galvanized or aluminized gray cast iron does not. 8 ref. (R7k; ST, CI, 8-62, 8-65)

28-R. (Russian.) **Experience of Czechoslovak Industry in Protecting Equipment to be Exported to Tropical Countries.** A. V. Ryabchenkov, V. M. Nikiforova, N. B. Nezvanova and B. D. Samuylenko. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 59-63.

Various methods and materials used as protective covering on merchandise and machinery against exposure. Some protective coatings are heavily charged with fungicide. (R10f)

29-R.* **Corrosion Control Methods.** *American Gas Journal,* v. 184, Sept. 15, 1957, p. 98-99.

Coatings, extra pipe wall thickness, cathodic protection, combinations of these methods for protection for underground piping; types of cathodic protection equipment. (R10; 4-10)

30-R.* **High-Temperature Oxidation and Contamination of Niobium.** William D. Klopp, Chester T. Sims and Robert I. Jaffee. *American Society for Metals, Transactions,* v. 50, Preprint no. 64, 1957, 27 p.

Oxidation and contamination rates of Cb in oxygen and in air were measured in the temperature range 600 to 1200° C. The oxidation curves in oxygen were linear and the rate constants were correlated by an Arrhenius-type plot. The activation energy for diffusion of oxygen in Cb was calculated from contamination data. Contamination in air-reacted Cb was similar to that in oxygen-reacted Cb, suggesting that oxygen is the primary diffusing contaminant. 13 ref. (R1h, N1; Cb)

31-R.* **Corrosion, Pyrophoricity, and Stress-Corrosion Cracking of Titanium Alloys in Fuming Nitric Acid.** J. B. Rittenhouse. *American Society for Metals, Transactions,* v. 51, Preprint no. 68, 1957, 43 p. (CMA)

Studies of the attack of fuming HNO_3 on Ti and Ti-8Mn showed that ignition sensitivity depended on the presence of fine particles on the surface, that stress-corrosion cracking occurred in Ti when the NO_2 content exceeded 6.5% (H_2O less than 0.7%) and in Ti-8Mn when NO_2 exceeded 0% (H_2O less than 0.8%). The corrosion-time relations of the metals in fuming HNO_3 with 20% NO_2 were measured in the range 25-71° C. 18 ref. (R6g, R1d; Ti)

32-R.* **Studies of the Oxidation and Contamination Resistance of Binary Niobium Alloys.** Chester T. Sims, William D. Klopp and Robert I. Jaffee. *American Society for Metals, Transactions,* v. 51, Preprint no. 70, 1957, 33 p.

Effects of binary alloying additions. The alloys contained up to 35 at. % Ti, Cr and Zr, 25 at. % V, Mo, Ta and W, and 5 at. % Be, B, Co, Fe, Mn, Ni and Si. The oxidation and contamination studies were conducted in air at 600, 800 and 1000° C. 8 ref. (R1h, 2-60; Cb)

33-R.* Stress-Corrosion Cracking of Insulated Austenitic Stainless Steel. A. W. Dana, Jr. *ASTM Bulletin,* no. 225, Oct. 1957, p. 46-52.

Stress-corrosion cracking which may occur when austenitic stainless steel piping is exposed to moist thermal insulating materials is believed to result from the action of water-soluble chlorides leached from the insulations. Chemical analyses showed that water-soluble chlorides are present in 85% magnesia, calcium silicate and glass fiber insulating materials, with little difference in chloride level between them. (R1d, R6; SS, 4-60)

34-R.* Resistance of Cast Iron to Cavitation Erosion. R. I. Higgins. *British Cast Iron Research Association Journal of Research and Development,* v. 7, Oct. 1957, p. 28-53.

Tests carried out on the jet impact machine and the magnetostriction apparatus. In the jet impact machine the specimens are rotated at a high speed through a jet of water. The calculated impact pressure is about 7.5 tons per sq. in. In the magnetostriction apparatus the specimen is vibrated in water at a high frequency (10,000 cycles per sec.) but through a very small amplitude. 8 ref. (R2m, 1-53; CI)

35-R. Corrosion of Metals in Buildings. R. W. Bailey and H. G. Ridge. *Chemistry and Industry,* v. 76, Sept. 1957, p. 1222-1227.

Performance of Zn and Zn sheet products in and on buildings, with steel protected from rust by means of a Zn coating, and with the behavior of Zn alloy die-cast builders' hardware. 16 ref. (R3, T26n; Zn)

36-R. A Review of Telephone Cable Corrosion Problems. *Corrosion,* v. 13, Oct. 1957, p. 134-137.

Usual practice and problems with suggestions for improving methods in making surveys of bare ducted cables. (R8, T1b; Pb)

37-R. Use of Stainless Steel to Combat Corrosion in the Chemical Industry. Pt. 2. *Corrosion,* v. 13, Oct. 1957, p. 138-146.

Pitting, concentration cell attack, sensitization, stress-corrosion cracking and hot shortness in stainless steels; relative susceptibility of common types to these defects; examples of failure. 26 ref. (R2; SS)

38-R. Artificial Insulating Joints for Stray Current Mitigative Measurements. G. H. Cantwell. *Corrosion,* v. 13, Oct. 1957, p. 616t-618t.

Method for applying direct current between structure and earth simulating an insulating joint making it possible to determine effect of insulating joint without placing temporary joints. (R1g)

39-R.* Corrosion of Austenitic Stainless Steels in Sulfuric Acid. E. H. Phelps and D. C. Vreeland. *Corrosion,* v. 13, Oct. 1957, p. 619t-624t.

Corrosion resistance of AISI Types 304, 310, 316, 317, 321 and 347 in saturated sulphuric acid solution at 30°, 50° and 70° C. Results presented in terms of "active passive" regions. Use of potential measurements for determination. 6 ref. (R6g; SS)

40-R. Standardization in the Field of Corrosion and Corrosion Protection in Germany. *Corrosion,* v. 13, Oct. 1957, p. 625t-626t.

Tabulates status of German standardization relating to corrosion, corrosion protection by chemical, electrochemical or galvanic coating and testing of metallic industrial materials. (R10, R11, S22)

41-R.* Corrosion and Metal Transport in Fused Sodium Hydroxide. Pt. 2. Corrosion of Nickel-Molybdenum-Iron Alloys. G. Pedro Smith and Eugene E. Hoffman. *Corrosion,* v. 13, Oct. 1957, p. 627t-630t.

Study of corrosion by fused sodium hydroxide of nickel-rich alloys at 815° C. for 100 hr.; reaction mechanism with Ni-Mo and Fe alloys found to involve removal of Fe and Mo from solid solutions with Ni. 8 ref. (R6s, R1; Ni, Mo, Fe)

42-R.* Sulfide Corrosion Cracking of High-Strength Bolting Material. Donald Warren and G. W. Beckman. *Corrosion,* v. 13, Oct. 1957, p. 631t-646t.

Behavior of AISI Type 4140 bolts in aqueous H_2S systems at 20 to 120° C. and pressures of 1 to 17 atm.; effect of bolt hardness, stress and plastic deformation; protection by metallic coating and corrosion inhibitors, mechanism of corrosion cracking of 4140 bolts. 24 ref. (R6g, T7f; AY)

43-R. Titanium, Zirconium and Tantalum for Control of Corrosion. William E. Lusby, Jr. *Corrosion,* v. 13, Oct. 1957, p. 654t-658t.

Corrosion resistant properties and progress in process application. 20 ref. (R general; Ti, Zr, Ta)

44-R.* High Alloys to Combat Corrosion. E. D. Weisert. *Corrosion,* v. 13, Oct. 1957, p. 659t-671t.

Corrosion resistant properties, mechanical properties, welding characteristics, general fabrication characteristics and heat treatment of Ni-Mo, Ni-Mo-Cr, Ni-Cr-Fe-Mo, Co-W-Ni, Co-W-C, Fe-Si, Fe-Si-Mo, and Ni-Si alloys. Applications in highly corrosive conditions in industries. 32 ref. (R general; SGA-g)

45-R.* Quantitative Comparison of Surface Finishes and Heat Treatment of Stainless Steel With Respect to Corrosion by Jet Fuels. R. G. Carlson. *Corrosion,* v. 13, Oct. 1957, p. 672t-676t.

Samples of AISI 440° C. stainless steel were hardened and tempered at different temperatures and given one of five different surface finishes and subjected to corrosive environment consisting of JP-4 fuel above water. Corrosion rates found for different surfaces and tempering treatments. (R7d, 2-64; SS)

46-R.* Growth of Ferrous Sulfide on Iron. R. A. Meussner and C. E. Birchenall. *Corrosion,* v. 13, Oct. 1957, p. 677t-689t.

Rate and nature of growth in sulphur vapor between 650 and 900° C. with vapor pressure of 10 to 500 mm. of mercury. Self-diffusion coefficient calculated for iron ions. 16 ref. (R6p, N1d; Fe)

47-R.* A Laboratory Study of N-Oleoyl Sarcosine as a Rust Inhibitor in Some Petroleum Products. Robert M. Pines and John D. Spivack. *Corrosion,* v. 13, Oct. 1957, p. 690t-694t.

Effectiveness of inhibitor in gasoline, mineral oil or silicon lubricants in preventing corrosion of steel specimens; provides effective inhibition under static and dynamic immersion test as well as in presence of humid atmospheres. 12 ref. (R10b, R11; ST)

48-R.* Plastic Flow of Iron Oxides and the Oxidation of Iron. J. D. Mackenzie and C. E. Birchenall. *Corrosion,* v. 13, Dec. 1957, p. 783t-785t.

Under certain conditions, the oxidation of Fe in oxygen at high temperatures is accompanied by the formation of a central box-like cavity the dimensions of which are identical to those of the original Fe specimen. The decrease in size of this cavity with increasing temperature and its disappearance when the formation of magnetite and hematite is excluded by a controlled oxidizing potential indicate the plastic properties of the oxides to be an important factor. Measurement of the relative plasticity of the three oxides at 800-1000° C. in a specially designed apparatus confirms this. 7 ref. (R1h; Fe)

49-R. Compatibility of Aluminum With Alkaline Building Products. C. J. Walton, F. L. McGeary and E. T. Englehart. *Corrosion,* v. 13, Dec. 1957, p. 807t-816t.

Tests under a variety of conditions. Chemistry of reactions between Al and alkaline building products; results of a series of laboratory tests. Aluminum corrodes only superficially and this corrosion is self-limiting in nature. 9 ref. (R1, R6; Al)

50-R.* Polarization in the Corrosion of Ice Breakers. J. H. Greenblatt. *Corrosion,* v. 13, Dec. 1957, p. 817t-820t.

Measurement of polarization characteristics of steel coupons subjected to the usual treatments given ship plating indicates that cathodic depolarization is the major factor influencing corrosion. At low temperatures in oxygenated water considerable anodic polarization occurred which would tend to mitigate corrosion. Results discussed in terms of observed corrosion patterns on the hulls of vessels operating in ice. (R1, R4; T22g)

51-R. Inhibiting Effect of Hydrofluoric Acid in Fuming Nitric Acid on Liquid and Gas Phase Corrosion of Several Metals. David M. Mason, Lois L. Taylor and John B. Rittenhouse. *Corrosion,* v. 13, Dec. 1957, p. 821t-827t.

Measurements at 130° F. of corrosion of several metals exposed to the liquid and the gas phase of thermally stable nitric acid containing 11 to 13% NO_2 and 2 to 4% water with and without hydrofluoric acid added as a corrosion inhibitor. 7 ref. (R6g, R10b)

52-R.* Fretting Corrosion as an Engineering Problem. K. H. R. Wright. *Corrosion Prevention and Control,* v. 4, Nov. 1957, p. 37-44.

Characteristics and mechanism of fretting corrosion; surface treatments and lubrication; fretting corrosion and fatigue. (R1f)

53-R.* Black Oxide Coatings on Steel: Quality Tests. J. Doss. *Electroplating and Metal Finishing,* v. 10, Sept. 1957, p. 289-290.

Steel panels treated in aqueous alkaline oxidizing bath to produce black magnetic oxide coatings were tested by oxalic acid, imbibation, humidity cabinet, citrate tests. The oxalic acid spot test found most reliable. (R11, L14a; ST)

54-R. Influence of Surface Pretreatment on the Atmospheric Oxidation of 2S (U. S. Alloy 1100) Aluminum. Philip M. Aziz and Hugh P. Godard. *Electrochemical Society, Journal,* v. 104, Dec. 1957, p. 738-739.

(R1h, 3-70; Al)

55-R.* Recent Metallurgical Problems in Marine Engineering. B. Tood. *Institute of Marine Engineers, Transactions,* v. 69, Aug. 1957, p. 320-325.

Examples of corrosion of condenser tubes, propeller shaft liners, ships' side valves of spheroidal graphite iron; brittle fracture of wrought iron anchor cables; fatigue failure of diesel engine pistons of spheroidal graphite iron; causes and preventives. 11 ref.
(R4b, Q26s, Q7, T22; CI)

56-R.* Stopping Corrosion With Rust Preventive Compounds. R. P. Mills. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 96-100.

Nature of corrosion and its prevention by petroleum rust preventive compounds. (R10b)

57-R.* Corrosion Resistant Materials—Metals and Alloys. Pt. 2. Lester F. Spencer. *Metal Finishing,* v. 55, Nov. 1957, p. 62-68.

Effect on Types 430, 302, 304, 347 stainless steels and nickel alloys of a variety of acid solutions. 12 ref. (R6g; SS, Ni)

58-R.* Scaling of Billets. Pt. 3. J. Moreau and M. Cagnet. *Metal Treatment and Drop Forging,* v. 24, Nov. 1957, p. 456-458.

Ordinary bessemer, oxygen bessemer and openhearth steels were studied. Influence of reheating time on total thickness of the scale, depth of contamination and decarburization; influence of reheating temperature, furnace atmosphere and quality of steel. 8 ref.

62-R. (French.) **Electrochemistry and Corrosion.** M. Pourbaix. *Corrosion et Anticorrosion,* v. 5, no. 9, Sept. 1957, p. 230-240.

Fundamental research in thermodynamics and electrochemical kinetics applied to corrosion. General conditions of electrochemical equilibrium between metals and their oxides and theoretical conditions of corrosion plotted in diagrams versus the pH of the solution. The thermodynamic study of polarization curves gives a precise idea of the possibility of corrosion in many cases. (R1)

63-R. (French.) **General Aspects of the Theory of Corrosion.** R. Piontelli. *Corrosion et Anticorrosion,* v. 5, no. 9, Sept. 1957, p. 241-243.

The concepts of total work of transformation and resistance of transformation. Definitions of immunity, cathodic protection and passivity. (R1, R10, 10-51)

64-R. (French.) **The Corrosion Engineer as a "Planner".** Jacques Baudin. *Corrosion et Anticorrosion,* v. 5, Oct. 1957, p. 269-274.

Duties of corrosion protection departments in manufacturing plants, their relation to other departments. (R general, A5b)

65-R.* (French.) **Corrosion Phenomena in Tubular Condensers. Some Typical Examples, Preventives and Correctives.** A. J. Maurin. *Corrosion et Anticorrosion,* v. 5, Oct. 1957, p. 275-285.

Definition and description of a tubular condenser. Detailed analysis

of cases of salt water corrosion in Texas plants of Dow Chemical Co. involving condenser elements in Cu, Cu alloy, steel, cast Fe, Al brass and Muntz metal as influenced by chlorination, cathodic protection, protective coverings, speed of circulation of water, presence of air, filtration of system water, periodic cleaning of system, iron content of water, respective locations of parts subject to corrosion. (To be continued.) (R4b, T1e; Cu, ST, CI)

66-R.* (French.) **Electrochemistry and Corrosion.** (Concluded.) M. Pourbaix. *Corrosion et Anticorrosion,* v. 5, Oct. 1957, p. 286-293.

Corrosion behavior of Fe in bicarbonate of sodium solutions of varying pH; of 18-8 stainless steel in acetic and acetate solutions with and without NaCl; influence of chlorides and phosphates on corrosion of Fe and common steel; conditions required for passivation; practical application of theories deduced from observations (e.g., corrosion protection of reinforcement Fe in concrete towers for overhead electric lines); methods of calculating corrosion rate of metals and alloys used in nuclear reactors, boilers, autoclaves, etc., at high temperatures and pressures. 42 ref. (R1, R2; ST, CI)

67-R. (French.) **Protection of Cables Against Corrosion.** M. Osty. *Corrosion et Anticorrosion,* v. 5, Oct. 1957, p. 294-298.

Water-tight coatings in various plastic materials of in asphalt-glass base composition have proved their effectivness on samples of cable subjected to an electrolytic action in an acid medium. (R7b, L26p, L26c; NM-g)

68-R. (French.) **Influence of Oxidation on the Superficial Chemical Composition of Refractory Alloys.** F. Malamand and G. Vidal. *Métaux-Corrosion-Industries,* no. 383-384, July-Aug. 1957, p. 286-299.

Study of oxidation by determination of superficial modification of chemical composition of the metallic layer underlying the oxide layer. Spectrographic method used in the case of refractory alloys (nimonic), from gas turbines. 22 ref. (R1h, S11k; EG-d, Ni)

69-R. (French.) **Prevention of Corrosion by Brine.** A. Maringe. *Revue Pratique du Froid,* no. 138, p. 41-44.

Typical cases of corrosion by cooling solution systems in breweries and ice plants; study of corrosion causes, remedies, preventives. (R4f, R10, W10g)

70-R. (German.) **Stress-Corrosion Testing Methods for Brass Compared With Long-Term-Storage Tests.** S. Hellsing, O. Lissner, S. Rask and B. Strom. *Werkstoffe und Korrosion,* v. 8, Oct. 1957, p. 569-573.

Mercury nitrate and ammonia tests are more severe than two years of storage (cartridge cases under rain shelters). 13 ref. (R11s, 1-15; Cu)

71-R. (German.) **Influence of Trace Elements on Anti-Scaling Properties of Heat Resistant Alloys.** H. Pfeiffer. *Werkstoffe und Korrosion,* v. 8, Oct. 1957, p. 574-579.

Ca and Ce among other trace elements impart improved oxidation resistance; effectiveness is caused by an increased adhesiveness of the oxide layer which is formed during high-temperature heating. Results of X-ray, photographic and supermicroscopic investigations of the formation of oxide layers on Fe-Cr-Al alloys. 20 ref. (R2q; 2-60; SGA-h, AD-n)

72-R.* (German.) **Austenitic Corrosion Resistant Nickel-Molybdenum Cast Alloys.** W. Gödecke. *Werkstoffe und Korrosion,* v. 8, Oct. 1957, p. 580-587.

Hastelloys of B and C types were subjected to electrochemical and metallographic investigation. The former could not be passivated while the latter showed some passivation inclination. Phase structure showed improved coefficients of extension, tenacity, plastic deformation and workability. Corrosion resistance and electrochemical properties of the one-phase solid solution B and C types were equal to the intermetallic two-phase commercial hastelloy. (R10c, P15, 2-60; Ni, Mo)

73-R. (German.) **Corrosion in High-Temperature Boilers.** Max Werner. *Werkstoffe und Korrosion,* v. 8, Oct. 1957, p. 587-596.

Experience with corrosion of highly heat resistant steels in 600° boilers after 40,000 hr. of operation. (R2q, R4c; 2-62, 3-67; SS)

Dissolution tests in HCl at 25° C. were conducted on samples of Armco iron of various thickness-area ratios. It appears, from analysis of the results, that the reaction consisting of combination of H atoms takes place at active points on the metal surfaces. The process of absorption, which occurs at different points, after achievement of a dynamic equilibrium inside the metal, appears to influence the total process of dissolution of iron and evolution of H, either as a result of polarization, through attainment of a certain maximum speed of diffusion, or as a result of a change, caused by absorption, in the crystal lattice. 17 ref. (R6g; Fe, *H*)

94-R.* (Italian.) Kinetics of the Dissolution of Iron in an Acid Medium. Pt. 2. Action of Certain Additives in Relation to Adsorbed Hydrogen. Liliana Felloni and Giampaolo Bolognesi. *Annali di Chimica,* v. 47, Sept. 1957, p. 996-1004.

Dissolution tests in HCl were conducted on samples of Armco iron to observe interaction caused by addition of inhibitor on quantity of H adsorbed. Iron dissolved at end of tests was determined, and kinetics of evolution of H, in presence of ethyl alcohol and of o-tolylthiourea, were followed. Action of inhibitors is characterized as deterrent to increase in overvoltage. 11 ref. (R6g, R10b; Fe, *H*)

97-R. (Italian.) Corrosion by Stray Currents. T. A. Turco. *Pitture e Vernici,* v. 13, Sept. 1957, p. 589-592.

Mechanism of corrosion by stray currents and newer methods of combatting same, including electrical measures and coatings of various types. 8 ref. (R1j)

98-R. Examination of a Failed Type 347 Stainless Steel Drum Used for the Storage and Shipping of Fuming Nitric Acid. P. R. Kosting and A. K. Wong. Watertown Arsenal. *U. S. Office of Technical Services,* PB 131112, June 1954, 23 p. $.75.
(R7b, W12c; SS)

99-R. (French.) Corrosion-Erosion. I. Ming-Feng and B. G. Rightmire. *Navires, Ports et Chantiers,* v. 8, Oct. 1957, p. 757-759, 785.

Mechanism of corrosion; a curve represents the weight of lost metal

as a function of number of effective cycles. (R1c)

100-R. (German.) **Resistance to Corrosion of Condenser Tubes Made of Copper Alloys.** K. Eichhorn. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 657-668.

35 ref. (R4, 4-60; Cu)

101-R.* (German.) **Sodium Benzoate as Corrosion Inhibitor in Aqueous Dispersions.** H. J. Freier and W. Geilenkirchen. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 673-677.

Sheet metals intended for containers for aqueous varnish dispersions are protected from corrosion by additives of sodium benzoate, or sodium benzoate-sodium nitrite. Protection depends mainly on acidity. Additions of 2% or less are effective. 9 ref. (R10b)

102-R. (German.) **Electrochemical Mechanism of the Inhibiting Action of Lead Oxides on Iron.** J. D'Ans, W. Breckheimer and H. J. Schuster. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 677-688.

Lead dioxide is ineffective because its high electric conductivity causes local cells. Reaction compounds of divalent Pb generate a protective coating on the basis metal which protects against corrosion. 7 ref. (R1, 2-66; Pb, Fe)

103-R.* (German.) **Protection Against Corrosion During Naval Transport in Tropical Climates.** Hermann Determann. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 689-694.

Special observations were made during trial runs on steel products. Insufficient amounts of silica gel as drying medium may result in slight to severe corrosion depending on tightness of package. Bacteria favor corrosion and bananas can b r e e d bacteria. Anticorrosive greases and wax help. Vapor phase inhibitor is a good anticorrosive. 7 ref. (R3s, R10)

104-R.* (German.) **Corrosion of Metal Surfaces in Tropical Climates.** O. Marsch. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 688.

Tropical conditions are simulated by testing products at 40° C. and 90% relative humidity. Products made of nonferrous metals or with varnished surfaces are preferred. Electric equipment with bright surfaces must be electroplated with Cu, Ni, Zn, Au or Ag. Sweating of insulating materials causes corrosion. (R3s)

105-R.* **Galvanic Corrosion of Aluminum-Steel and Aluminum-Lead Couples.** M. J. Pryor. *Corrosion,* v. 14, Jan. 1958, p. 1t.

The galvanic current and the corrosion rate of the Al are proportional to the area of the steel cathode and are independent of the area of the Al anode. Factors increasing the access of oxygen to the cathode surface, such as stirring and aeration, increase the galvanic corrosion rate proportionately. (R1a; Al, ST, Pb)

106-R.* **Oxidation of Molybdenum.** E. S. Jones, J. F. Mosher, Rudolph Speiser and J. W. Spretnak. *Corrosion,* v. 14, Jan. 1958, p. 2t-8t.

Rate of evaporation of MoO_3 and the mechanism of Mo oxidation were determined. After an initial parabolic dependence of weight change upon time the rate of oxidation became linear. The outer MoO_3 layer is nonprotective so that the rate of oxidation of the suboxide to the trioxide at the suboxide-trioxide interface is equal to the rate of diffusion of oxygen through the suboxide film to the metal-suboxide interface. 29 ref. (R1h; Mo)

107-R.* **Effect of No, HNO_2 and HNO_3 on Corrosion of Stainless Steel by H_2SO_4.** W. P. McKinnell, Jr., L. F. Lockwood, R. Speiser, F. H. Beck and M. G. Fontana. *Corrosion,* v. 14, Jan. 1958, p. 9t-12t.

Specimens of Type 302 stainless steel, activated by abrading on 240-grit emery cloth and exposed to 10% H_2SO_4 solutions, were passivated by bubbling nitric oxide through the solution. Bubbling oxygen through the solution did not passivate abraded specimens. Abraded specimens exposed to an atmosphere of nitric oxide before immersion in nitric oxide-free H_2SO_4 remained active. 7 ref. (R6g, R10c; SS)

108-R.* **Kinetic Study of Acid Corrosion of Cadmium.** Henry Weaver, Jr., and Cecil C. Lynch. *Corrosion,* v. 14, Jan. 1958, p. 13t-14t.

Kinetics of the reaction of dilute hydrochloric acid with Cd metal, molded, electroplated on brass, and dipped on brass, investigated by calibrated conductance measurements. The effect of annealing molded Cd samples was to reduce the corrosion rate. The reaction rates at three acid concentrations and at three temperatures were determined. 8 ref. (R6, 2-64; Cd)

109-R.* Compilation and Correlation of High Temperature Catalytic Reformer Corrosion Data. G. Sorell. *Corrosion,* v. 14, Jan. 1958, p. 15t-26t.

Corrosion is attributed to small quantities of hydrogen sulphide present in the hot hydrogen-rich gas mixtures. The principal variables affecting the rate of attack are temperature and hydrogen sulphide concentration. Other factors, such as pressure, hydrogen content, time to exposure, cycling conditions and scale properties, discussed in relation to their effect on corrosion. 22 ref. (R7a)

110-R.* High-Temperature Hydrogen Sulfide Corrosion of Stainless Steels. E. B. Backensto, R. E. Drew, J. E. Prior and J. W. Sjoberg. *Corrosion,* v. 14, Jan. 1958, p. 27t-31t.

Only the austenitic steels offer satisfactory resistance to this type of attack under a wide range of conditions in the petroleum industry. Investigation covered the possible application of the new manganese-modified stainless steels; the effect of heat treatment on corrosion rate; comparison of corrosion rates of wrought, welded and cast stainless steel; tests on stress-corrosion cracking. 5 ref. (R6, R1d; SS)

111-R.* Breakaway Oxidation of Zirconium-Tin Alloys. Earl A. Gulbransen and Kenneth F. Andrew. *Corrosion,* v. 14, Jan. 1958, p. 32t.

A breakaway oxidation reaction is found for Zr-Sn alloys similar to the breakaway corrosion reaction found for steam reactions. As oxidation is a simple reaction to study, the basic breakaway phenomena may be elucidated. Data show the breakaway oxidation of Zircaloy II from 600 to 800° C. 9 ref. (R1h; Zr, *Sn*)

112-R.* Theoretical Aspects of Corrosion in Low Water Producing Sweet Oil Wells. *Corrosion,* v. 14, Jan. 1958, p. 33t-35t.

Principal corrosive agents are hydrolytic products of inorganic salts. These salts may be deposited on metal either in the form of a thin layer or as a consolidated scale. In addition to hydrolysis of the salts, electrochemical cells are set up between the metal and the various scale constituents and thus add to the corrosion. Physical appearance of the scale and changes in physical conditions were found to affect the corrosion rate. (R6j)

113-R.* Fuel Ash Attack on Aluminum Coated Stainless Steel. J. E. Srawley. *Corrosion,* v. 14, Jan. 1958, p. 36t-38t.

Laboratory investigation of the resistance of hot dip Al coated Type 310 stainless steel to attack by residual oil ash constituents. The coated specimens did not exhibit better resistance than the uncoated steel, nor did prior heat treatment of the coated specimens have an appreciable effect. Results of a boiler test were in agreement with the laboratory finding. 7 ref. (R7d; SS, *Al,* 8-65)

114-R.* Cavity Formation in Iron Oxide. D. W. Juenker, R. A. Meussner and C. E. Birchenall. *Corrosion,* v. 14, Jan. 1958, p. 39t-46t.

Study of the deep oxidation of Fe at high temperatures and in an oxygen atmosphere. Large cavities are always found in specimens whose total oxygen content has been brought to that of FeO. The scale thickness of such specimens, along with other evidence, implies that FeO is plastic in the temperature range in which it is stable, while one or both of the higher oxides is relatively rigid. 8 ref. (R1h; Fe)

115-R.* Corrosion and Metal Transport in Fused Sodium Hydroxide. Pt. 3. Formation of Composite Scales on Inconel. G. Pedro Smith, Mark E. Steidlitz and Eugene E. Hoffman. *Corrosion,* v. 14, Jan. 1958, p. 47t-52t.

Inconel was exposed to fused sodium hydroxide at temperatures of 450 to 815° C. and times up to 400 hr. The observed reaction was shown to consist in the selective leaching of Fe and Cr from their solid solution with Ni. The reaction product, a mixture of oxides and sodium oxysalts, was found to grow in a network of channels which, starting from the metal surface, penetrated into the bulk Inconel. 7 ref. (R6j, R2q, R2a; Ni)

116-R.* Structural Features of Corrosion of Aluminum Alloys in Water at 300° C. Kurt M. Carlsen. *Corrosion,* v. 14, Jan. 1958, p. 53t-56t.

A number of Al alloy specimens were immersed in distilled water heated to 300° C. and a study made of the structural features of corrosion. Samples were of the following general alloy types; Al-Ni, Al-Fe, Al-Ni-Fe, Al-Cu and Al-Ni-Si alloys. After exposure samples were examined by metallographic microscope. (R4a, 1-66; Al)

117-R.* Organic Corrosion Inhibitors for Iron. Robert Jenny. *Industrial Finishing (London),* v. 9, Oct. 1957, p. 872-876, 890.

Inhibition of acid corrosion of Fe by mercaptans. Study of the nature of reactions occurring between mercaptans and Fe in acid solutions; nature of organic corrosion inhibition. (R10b; Fe)

118-R.* Nature of Pitting Attack on Cast Iron Propellers and Preliminary Experiments on Its Prevention by Cathodic Protection. R. I. Higgins. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Dec. 1957, p. 129-143.

The incidence, form and distribution of this attack appear to be dependent, to some extent, on the tip speed of the propeller. Nature of pitting; evidence shows that the metal is removed by a corrosion process rather than by an erosion process. Attack can be prevented by cathodic protection by means of a sacrificial magensium anode which is attached to the propeller rather than the hull of the ship.
(R2j, R10d, T22h)

119-R.* Material Transport in Sodium Systems. Fred G. Haag. Paper from "Liquid Metals Technology", Pt. 1. Chemical Engineering Progress Symposium Series, p. 43-50.

Results of comprehensive investigation into cause and magnitude of material transport in flowing Na systems by use of radioactive tracer techniques. Transfer tests include capsule experiment and lube test with AISI 347 stainless steels as structural material. Effects of oxygen concentration, temperature gradient, time, velocity, reactor conditions and presence of migration inhibiting elements on the rate of transfer of radioactive isotopes, from stainless steel activated by exposure in reactor. 13 ref.

135-R. Acetic Acid Salt Spray Test. J. H. Hooper. *Electroplating and Metal Finishing,* v. 10, Dec. 1957, p. 403-408.

A comparison with other methods of simulating service breakdown of protected metal surfaces. 8 ref. (R11j)

136-R.* Rustproofing Oils for Processing. Eugene R. Slaby. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 103.

Present-day slushing oils when correctly applied to sheet or strip steel can effectively safeguard surfaces against rust and corrosion; rust preventives permit shipment of coils without customary wrappings. (R10f; ST, NM-h, 4-53)

137-R.* Corrosion of Tinplate by Victoria Plum Syrup. F. W. Salt and J. G. N. Thomas. *Iron and Steel Institute, Journal,* v. 188, Jan. 1958, p. 36-45.

The syrup contains both inhibitors and accelerators of corrosion. Stannous tin inhibits the corrosion appreciably, but stannic tin slightly accelerates it. A number of possible organic inhibitors have been investigated in the plum syrup and two, caprylic and caproic acids, were found to give appreciable inhibition in the presence of 25 ppm. stannous tin. Caprylic acid alone in the plum syrup greatly increases the steel corrosion rate. 16 ref.

141-R. (French.) **The Oxidation of Billets.** J. Moreau and M. Cagnet. *Institut de Recherche de la Siderurgie*, Series A, no. 157, p. 1-23.
Study made by micrography, X-ray and electronic microprobe (Castaing). Structure and composition of oxides; contamination of the steel; kinetics of oxidation; influence of the temperature and the atmosphere of the furnace on the formation of oxides; reproduction of the oxidation in laboratory. (R1h, R2q; ST, 4-52)

142-R.* (German.) **Some Basic Problems of the Formation and Adherence of Scale on Iron.** H. Engell and F. Wever. *Acta Metallurgica*, v. 5, Dec. 1957, p. 695-702.
Some kind of Kirkendall effect occurs due to preferential diffusion of either metal or oxygen in an oxide layer during the scaling of metals. If the metal diffusion predominates, voids are formed between scale and metal, or the oxide layer is porous. Both these phenomena influence the mechanical adherence of scale on the metal and the kinetics of oxidation. In the case of preferential diffusion of oxygen there will be a compressed region at the boundary metal to oxide (if the oxide has a larger specific volume than the metal) which facilitates the peeling-off of the scale. 6 ref.

148-R.* **Corrosion of Stainless Steels in Boiling Acids and Its Suppression by Ferric Salts.** Michael A. Streicher. *Corrosion*, v. 14, Feb. 1958, p. 59t-70t.
Influence of various alloying elements in stainless steels on the course of corrosive attack by eight acids. Factors in the environment (acid concentration, corrosion products and oxygen) which determine the course of corrosion. The acids used were oxalic, formic, acetic, hydroxy-acetic, phosphoric, sulphuric, sulphamic and sodium bisulphate and the stainless steels included straight Cr (AISI 400 series), 18-8 Cr-Ni (AISI 300 series) and some Cr-Mn-Ni steels. 23 ref.
(R6g, R10a; SS)

149-R. Inter Society Corrosion Committee Glossary of Corrosion Terms. *Corrosion*, v. 14, Feb. 1958, p. 71t-72t.
Definitions for 53 commonly used terms. For certain terms, supplementary wording is included to make the definition more easily understood. (R general, 11-67)

150-R.* Corrosion of Metals in Tropical Environments. Pt. 1. B. W. Forgeson, C. R. Southwell, A. L. Alexander, H. W. Mundt and L. J. Thompson. *Corrosion,* v. 14, Feb. 1958, p. 73t-81t.

Corrosion rates and characteristics of 50 different metals and alloys exposed to five natural tropical environments for various periods. Corrosion rate of Al, Pb, Ni, Zn, Cu and structural steel. Corrosion data are obtained from weight loss and pitting measurements, visual inspection and physical property studies. 6 ref.
(R3s, 3-67; Al, Pb, Ni, Zn, Cu, ST)

151-R.* Effect of Inhibitors in Fuming Nitric Acid on Corrosion and Oxidation. Tin Boo Yee. *Corrosion,* v. 14, Feb. 1958, p. 82t-84t.

Procedure by which an inhibitor for fuming nitric acid can be selected to give good inhibition to corrosion and, at the same time, increase the oxidizing power of the acid. The inhibitors used in this study are KI, KIO_3, I_2, I_2O_5, CaF_2, HF, NH_4F, and Na_3AlF_6.
(R10b, R6g)

152-R. Corrosion of Lead Sheath in Manhole Water. *Corrosion,* v. 14, Feb. 1958, p. 85t-87t.

Tests were made in 45 selected manholes in Tokyo by attaching Pb coupons to cable sheaths in the manholes and submerging coupons in the manhole water. Corrosion losses by weight measured at 100 and 240 days were proportional to potential difference between cable and ground. Pitting was found where potential to ground was more than 100 mV. No relationship between weight losses and water composition could be determined because of varying potentials to ground. (R4a, R1j; Pb)

153-R.* Electrochemical Deterioration of Graphite and High-Silicon Iron Anodes in Sodium Chloride Electrolytes. S. Tudor, W. L. Miller, A. Ticker and H. S. Preiser. *Corrosion,* v. 14, Feb. 1958, p. 93t-99t.

Influences of specific resistivity of the electrolyte and of anodic current density on electrochemical deterioration. Deterioration of graphite increases with increasing specific resistivity or decreasing NaCl concentration of the electrolyte. The effect of impregnation of graphite anodes on the electrochemical deterioration rates and the variation of this effect with electrolyte specific resistivity are indicated. 9 ref. (R1a, W3h; Fe, *Si,* NM-k36)

154-R.* Corrosion in Amine Gas Treating Solutions. Frances S. Lang and J. F. Mason, Jr. *Corrosion,* v. 14, Feb. 1958, p. 105t-108t.

Laboratory corrosion tests on steel, stainless steels, Monel, and Ni in amine solution saturated with carbon dioxide and hydrogen sulphide. Effects of temperature, pressure and amine concentration and the presence of sludge. Type 304 and 316 stainless steel gave consistently low corrosion rates under all conditions. Monel was satisfactory when carbon dioxide or hydrogen sulphide were present singularly in the amine but mixtures of the gases were damaging. 9 ref.
(R7; ST, SS, Ni)

155-R.* Variables Influencing Corrosivity of Oil and Gas Wells. *Corrosion,* v. 14, Feb. 1958, p. 108-116, 120.

Well variables include temperature, pressure, carbon dioxide content, organic acid content, velocity. An example of poor correlation among these factors and accepted theories of well corrosion. Influence of steel inhomogeneities and problems involving human error.

157-R.* Corrosion Problems With Fuming Nitric Acid Rocket Fuel Requires New Tests. M. G. Fontana. *Corrosion Technology,* v. 4, Dec. 1957, p. 423-424.

Corrosion fatigue of materials in fuming nitric acid; cathodic protection tests and stress-corrosion tests of certain types of stainless steel; polarization studies of Al and stainless steel; studies designed to show concentration cell corrosion, including corrosion by sludged fuming nitric acid. (R6g, R11s; SS)

158-R. (French.) **Cathodic Protection of Pipes by Drawing Off Current.** G. Fauvel. *Corrosion et Anticorrosion,* v. 5, no. 11, p. 331-338.

The effectiveness of a cathodic protection system depends upon length of pipe to be protected and size of the ground terminal. An example of calculation of cost of protection by kilometer of pipe is given. The size of the ground terminal is calculated as a function of intensity of the protecting current and ground resistivity. The rectifiers used are chosen with re-

spect to economic conditions and physical properties of the protected pipe. (R10d, 5-60)

159-R. (French.) **Thickness Decrease in Steel Sheets and Pipes Caused by Corrosion.** M. G. Piron. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 339-347.

Several nondestructive processes are reviewed, including photography, television, acoustic methods, radiography and electric methods. The magnetic method is emphasized. (R11a, S14, 4-53, 4-60; ST)

160-R. (French.) **Protection of Materials for Propellant Rocket Motors Working With Unstable Combustion.** B. Langenecker. *Métaux, Corrosion, Industrie,* no. 385, Sept. 1957, p. 343-351.

Gaseous bubbles tear small crystals off the metal surface by condensation. The catalytic activity of the exposed surfaces is such that the flash point of the fuel is lowered and combustion accelerated. Then, metallic grains are burnt or melted. The only preventive is the increase of combustion stability. 24 ref. (R7d, T2p)

161-R. (German.) **Structure of Scale and Strength of Adhesion to the Surface of Carbon Steel Plates.** Hans-Jurgen Engell and Friedrich-Karl Peters. *Archiv für das Eisenhüttenwesen,* v. 28, Sept. 1957, p. 567-574.

Both the final hot rolling temperature and the killing of steel with Si or with Si and Al influence the formation and the strength of adhesion of scale. The structure and composition of scale was investigated and the formation of an intermediate layer of high silicate contents in killed steel was proven. 8 ref. (R2q, M28; CN, 4-53)

162-R. (German.) **Rust Inhibitors.** H. Spindler. *Fertigungstechnik,* v. 7, Sept. 1957, p. 429-430.

Determination of exact amount of the rust inhibitor required is main obstacle in application. Its usability must be determined in practice. 10 ref. (R10b; CI, ST)

163-R.* (Italian.) **On Some Inhibitors of Aluminum Corrosion. Pt. 2. Effect of Tannic Acid on 99% Al in 1 *N* Hydrochloric Acid.** G. de Angelis and V. Carunchio. *Metallurgia Italiana,* v. 49, Nov. 1957, p. 783-792.

On basis of loss of weight and reaction potential of Al electrodes in a galvanic cell, and of electrochemical behavior and polarization curves of an Al-Fe couple, it is concluded that dissolution of Al in 1 *N* HCL is electrochemical in nature and under mixed control; that tannic acid inhibits corrosion of 99% Al by acting on anodic and cathodic polarizations; that action of the acid is presumably due to its adsorption over entire surface (i.e., on both anodic and cathodic areas). 19 ref. (R10b; R6g; Al, Fe)

164-R.* (Russian.) **Corrosion Resistance of Metals Used in Hydroturbine Parts.** M. G. Timerbulatov. *Metallovedenie i Obrabotka Metallov,* Oct. 1957, p. 12-18.

Seven grades of steels and two grades of high-strength cast iron evaluated for weight losses due to corrosion in water. Addition of phosphorus to carbon steel containing 1.32% Cu was detrimental. High-strength cast iron was worse than carbon steel containing Cu. Negligible losses were observed with steel containing 12.33% Cr. Details of best heat treatment of carbon steel containing Cu in respect to best anticorrosive properties. 5 ref. (R4, 2-60; ST, CI)

The salt-crust process as means of preventing coal-dust explosions by immobilizing coal dust deposited on mine roads. (R6, R10b; Fe, ST)

189-R. Study of the Corrosion of Vaporizing-Liquid Type Fire Extinguishers. J. A. Bono. *Underwriters' Laboratories, Inc., Bulletin of Research,* no. 50, Dec. 1957, 54 p.

Principal factor in corrosion of pump-type vaporizing-liquid fire extinguishers was found to be the composition of the liquid. Presence of 0.80% carbon disulphide, and use of trichloroethylene as freezing point depressant found to be desirable characteristic of the liquid. Absence of carbon disulphide rendered extinguishers very susceptible to corrosion. (R6p)

190-R. Corrosion of Aluminum by Alkaline Sequestering Solutions. H. W. McCune. *Industrial and Engineering Chemistry,* v. 50, Jan. 10, 1958, p. 67-70.

Corrosion by alkaline and alkaline sequestering solutions, and by solutions of sodium triphosphate and tetra-acetate. 18 ref. (R6j; Al)

191-R.* Acceleration Corrosion Testing of Chromium-Plated Articles—Sulphur Dioxide Test. J. Edwards. *Institute of Metal Finishing, Bulletin,* v. 7, Winter 1957-1958, p. 55-78.

Accelerated corrosion test employing a humid atmosphere containing sulphur dioxide. Permissible variations in sulphur dioxide concentration, relative humidity and temperature; required conditions can be maintained by simple methods; 24 hr. is a sufficiently long test period for most purposes. The corrosion pattern developed closely resembles that produced by outdoor exposure. The test is suitable for a variety of coatings on steel, and may also be effective on other basis metals. 7 ref. (R11k; ST, 8-62, *Cr*)

192-R.* Potentiostat Technique for Studying the Acid Resistance of Alloy Steels. C. Edeleanu. *Iron and Steel Institute, Journal,* v. 188, Feb. 1958, p. 122-132.

It is possible to determine a "potential-current" (P-C) diagram for each steel and from these it is possible to predict under what conditions the steel will have adequate resistance. The potential-corrosion-rate curve can be regarded as an anodic polarization curve by substituting the equivalent current for the corrosion rate, and from it, it is possible to determine the rate at which the anodic (electron-producing) reaction tends to occur at any given potential. 14 ref. 205-R.* (French.) **Study of Physical Antiscaling Treatments.** J. Laureys and M. Pourbaix. *Cebelcor, Rapport Technique no. 56,* Sept. 1957, 36 p.

Laboratory installation for evaluation of efficacy of water treatment methods in the case of distilling equipment. Effectiveness of magnetic and electromagnetic treatments, mercury floats, and inoculation with sodium metaphosphate and sodium uranate. Influence of a prior trickling treatment on scale-forming effect of nontreated water and magnetically treated water. Physicochemical effects connected with conditions of efficacy of physi-

cal treatments. Effect of external factors on crystallization phenomena. Current research program of Cebelcor Commission on Antiscale Formation Processes. 9 ref. (R10a, R4, A9)

206-R.* (French.) **Lessons on Electrochemical Corrosion (Provisional Notes). Pt. 1.** M. Pourbaix. *Cebelcor, Rapport Technique no. 57,* Nov. 1957, 26 p.

Part of course (in three parts) given at School of Applied Sciences of University of Brussels. Basic principles governing phenomena of corrosion by aqueous solutions and application of principles to study of technical problems of corrosion and scaling. Economic and technical aspects of corrosion; scientific aspects such as complexity of phenomena, use of chemical and electrochemical thermodynamics. 6 ref. (R1, R6)

207-R.* (French.) **On Grading the Corrosion Resistance of Steels Under Stress in Saline Solutions Saturated With Hydrogen Sulphide.** Eugene Herzog. *Comptes Rendus,* v. 245, Dec. 16, 1957, p. 2280-2282.

A mild killed steel, a mild carbon steel, a semihard Mn-Mo steel, and a mild Cr-Mo-Al-V steel were subjected to cold working, then immersed in solution of sodium chloride and hydrogen sulphide, with tensile stresses being simultaneously applied. Conditions of normal service were simulated as closely as possible, and respective intervals of time before rupture were recorded. Appearance of cracks was influenced by percentage of hydrogen ions in solution, prior cold working, amount and distribution of stress. (R1d, R6j; ST)

208-R.* (French.) **Use of Radioactive Isotopes in the Study of Metallic Corrosion in Alkaline Media.** Helmy Makram. *Comptes Rendus,* v. 246, Jan. 6, 1958, p. 99-101.

Specimens of electrolytically pure Cu were irradiated by means of an atomic pile, then immersed in solutions of NaOHN, trigon, or P.Z. Passage of marked ions into solution was studied in function of time. (R11, 1-59; Cu-a)

209-R.* (French.) **On a Colloidal Interpretation of the Phenomena of Corrosion and Inhibition.** Jean Frasch. *Corrosion et Anti-Corrosion,* v. 6, Jan. 1958, p. 9-14.

Attempt to fit into electrochemical theory of corrosion and inhibition some of theories which have been advanced concerning colloidal nature of majority of products of corrosion. (R10b, 14-65)

210-R.* (French.) **Corrosion Phenomena in Tubular Condensers. Some Typical Examples, Correctives and Preventives.** A. J. Maurin. *Corrosion et Anti-Corrosion,* v. 6, Jan. 1958, p. 15-24.

Additional case histories; influence of microstructure of Cu alloys on corrosion susceptibility of condenser piping; a logometric apparatus that can be substituted for cathodic protection when latter is not feasible; brief listing of causes of condenser corrosion and of remedial measures available. (Concluded.) (R4, R10d; Cu, 4-60)

211-R. (French.) **Light Metals and Alloys in Corrosive Media.** J. Herenguel and Pierre Lelong. *Nature,* no. 3271, Nov. 1957, p. 445-450.

Nature of corrosion; laboratory methods of determining corrosivity; types of protection available; corrosivity of Al and Mg alloys, Be, Ti and Zr.
(R-general; Al, Mg, *Be, Ti, Zr*)

212-R.* (French.) **Carbonate of Cyclohexylamine: Its Use as a Volatile Corrosion Inhibitor.** *Produits Chimiques,* v. 60, Nov. 30, 1957, p. 471-473.

Properties, including nontoxicity; applications to ferrous metals, either bare or plated with Cr, Ni, Monel metal, Pb, Zn or Al; corrosion protection afforded machinery during marine transport, industrial equipment during extended shutdowns, machinery and parts subjected to wear. (R10b)

213-R.* (French.) **Molybdenum Alloys and Their Protection Against Oxidation.** H. Buckle. *Recherche Aeronautique,* no. 61, Nov-Dec. 1957, p. 35-52.

Theoretical and practical problems of use of Mo alloys for heat engine parts. Above 500° C. protection must be provided by coatings. Those now available can be used at temperatures in excess of 1700° C., but are not entirely satisfactory when subjected to appreciable mechanical stresses. Best protective coatings now known are made of Ti, Pt and Cr; special Ni-Fe-Co-Cr alloys having unusually low coefficients of expansion; refractory alloys with Ni, Fe or Co bases, with underlying

layer of Ti, Pt or Cr; and alloys containing elements susceptible of forming their own underlying layer, such as $MoSi_2$. Properties of coatings, methods of application and effectiveness of coatings as influenced by application technique. 29 ref. (R1h, L-general; Mo)

214-R. (French.) **Contribution to the Study of the Phenomenon of Frictional Erosion in Hydraulic Turbines.** T. Bovet. *Schweizer Archiv,* v. 23, Dec. 1957, p. 377-388.

Mechanism of abrasion. Study of deterioration of principal parts of Pelton, Francis, Kaplan turbines; preventive measures. (R1c, Q9p, W11n)

215-R.* (Italian.) **Research on the Oxidation of Metals and Alloys in the Molten State. Pt. 6. The Cadmium-Tin System.** Paolo Spinedi. *Gazzetta Chimica Italiana,* v. 87, Dec. 1957, p. 1420-1432.

Study by means of a continous recording thermic balance of oxidation behavior of binary alloys of Cd and Sn; investigation was extended to temperatures much higher than melting. Results discussed in terms of phase diagrams. Alloy containing about 5% Cd showed rather high resistance to oxidation, this property being ascribed to typical structure of the beta phase, which is stable in vicinity of above concentration, and the influence of which is still seen in the liquid phase. Includes study of oxide films as influenced by composition of respective alloys and characterized by decided morphological changes, especially in certain composition ranges. 7 ref. (R1h, M24; Cd, Sn, 14-60)

216-R.* (Italian.) **Research on the Oxidation of Metals and Alloys in the Molten State. Pt. 7. Zinc.** Paolo Spinedi. *Gazzetta Chimica Italiana,* v. 87, Dec. 1957, p. 1433-1439.

Study by continuous recording thermic balance of oxidation behavior of zinc in temperature range between 250-800° C. Oxidation mechanism is probably controlled by same laws in both solid and liquid states, although speed of process appears to be different for each state. Comparison of data obtained from similar studies conducted on other metals previously treated in this series. 20 ref. (R1h, Zn, 14-60)

217-R. Stainless Steels for Corrosion Resistance. L. R. Honnaker. *Chemical Engineering Progress,* v. 54, Jan. 1958, p. 79-82.

Causes, means of avoiding failures in stainless steel equipment resulting from pitting crevice corrosion, intergranular corrosion, stress-corrosion cracking and related phenomena where general corrosion is slight. 6 ref. (R1d, R2h, R2j; SS)

218-R. Corrosion Problems in Pulp and Paper Mills—Present Day Answers. D. F. Roberts. *Southern Pulp and Paper Manufacturer,* v. 21, Feb. 10, 1958, p. 84-87, 126.

(R2, L26, T29r; ST)

219-R. Development and Properties of Uranium-Base Alloys Corrosion Resistant in High-Temperature Water. Pt. 4. Radiation Stability of Uranium-Base Alloys. Westinghouse Electric Corp. *U. S. Atomic Energy Commission,* WAPD-127, Pt. 4, May 1957, 113 p.

27 ref. (R4, 2-62, 2-67; U, *Mo, Cb*)

220-R. Inhibition of Hydrogen Corrosion of Uranium. A. Kreig and J. M. Napier. Union Carbide Nuclear Company. *U. S. Atomic Energy Commission,* Y-1151, July 1, 1957, 37 p.

12 ref. (R4c, T11, Th, *Zr,* 8-66)

222-R. Corrosion of Monel and 70-30 Cupronickel in Hydrofluoric Acid. Walter J. Braun, Frederick W. Fink and G. Lee Ericson. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1237, Dec. 3, 1957, 18 p. (Available at U. S. Office of Technical Services, $.75.)

(R6g; Ni, *Cu*)

223-R.* (French.) **Search for a Substance With Combined Anti-Oxidizing and Corrosion Inhibiting Properties in Relation to Olein and Iron.** J. P. Sisley, M. Loury and C. Defromont. *Revue Francaise des Corps Gras,* v. 4, Mar. 1957, p. 149-154.

No product now in use in industry combines both properties. Diphenylpara-phenylenediamine and dibeta - naphtyl - para - phenylenedimine are composed of poly-functional molecules and could be used to develop type of product desired. 7 ref. (R10b; Fe)

224-R.* (Italian.) **On the Lag Interval in Hydrogen Reduction of Products of Oxidation of Metallic Iron at High Temperatures.** Agostino Bargone and

Vittorio Gottardi. *Tecnica Italiana,* v. 12, Oct-Nov. 1957, p. 449-455.

Review of research on oxidation of iron and hydrogen reduction of resultant products; experimental observations which explain lag period observed during reduction. Lag is related to composition and morphology of the oxides and to temperature and duration of oxidation process. (R1h, 2-62; Fe)

225-R. Experiences With Filming Amines in Finland. Paavo Kajanne. *Corrosion Prevention and Control,* v. 4, Dec. 1957, p. 49-53.

Use of film-forming amines as internal coatings for boiler and heat transmission tubing to prevent corrosion and loosen corrosion products already formed. 16 ref. (R4c, R10b)

226-R. Influence of Insulation Design on Condensation and Corrosion. N. L. Dolbey. *Corrosion Technology,* v. 5, Feb. 1958, p. 41-44.

Poorly designed and installed insulation, especially if coated with water-resistant paint, will result in a large amount of condensation within the insulation, leading to serious corrosion problems. (R3)

227-R.* Underground Corrosion. Pt. 2. Behavior of Protective Coatings in Soils. Melvin Romanoff. *Corrosion Technology,* v. 5, Feb. 1958, p. 45-48, 56.

Results of field tests on metallic and bituminous coatings of pipes indicate that both methods are reasonably effective. The most common cause of failure was due to injury of the coating during installation of the pipe. (R8, L26a)

228-R. Chemical and Electrochemical Affinities of Corrosion Processes. Pierre Van Rysselberghe. *Corrosion Technology,* v. 5, Feb. 1958, p. 49-52, 62.

Analysis of corrosion reactions applying the concepts of chemical and electrochemical affinities, the principles of equilibrium thermodynamics and the thermodynamics of irreversible processes. (R1a)

229-R.* High Temperature Hydrogen Sulphide Corrosion in Commercial Sovaformer Units. Pt. 2. E. B. Backensto, R. D. Drew and J. N. Vlachos. *Corrosion Technology,* v. 5, Feb. 1958, p. 53-56.

Test results obtained in two commercial sovaformers show that both temperature and hydrogen sulphide are basic variables in this type of corrosion. Aluminizing provides protection from sulphide corrosion attack. Use of 18-8 Cr-Ni alloys is also suggested. (R6g, 2-62; SS, *Al*)

230-R. Two New Accelerated Corrosion Tests. An Assessment. *Electroplating and Metal Finishing,* v. 11, Jan. 1958, p. 15-16.

The acetic acid salt spray test and sulphur dioxide test in the evaluation of electrodeposited coatings. (R11; 8-62)

231-R.* Accelerated Corrosion Testing of Chromium-Plated Articles: Sulphur Dioxide Test. J. Edwards. *Electroplating and Metal Finishing,* v. 11, Jan. 1958, p. 17-22.

Apparatus and procedure. Experimental studies on varying sulphur dioxide concentration, correlation with outdoor exposure, reproducibility in different test cabinets and variation of corrosion patterns for Ni-Cr with and without undercoats of Cu or bronze and Sn-Ni on steel and other Cr-plated metals. 5 ref. (R11; 8-62, *Cr*)

232-R. Materials for Corrosion Control. Frederick W. Fink. *Industrial and Engineering Chemistry,* v. 50, Jan. 10, 1958, p. 129A-131A.

Review of literature; new corrosion problems in nuclear energy field; potentials and limitations of Ti and Zr in corrosion control. 18 ref. (R-general, T11, 10-54; Ti, Zr)

233-R. Alkaline Digester Corrosion. J. J. Wegerif. *Pulp and Paper,* v. 59, Jan. 1958, p. 104-108.

(R2g, T29r)

234-R. Prevention of Corrosion in Steam and Condensate Systems. T. B. Fielden. *Steam Engineer,* v. 27, Jan. 1958, p. 123-125.

Measures to combat steam condensate corrosion by use of filming amines. 7 ref. (R4d)

235-R. Electron Optical Studies of Oxidation Processes Occurring in High Vacuum. E. A. Gulbransen and K. F. Andrew. Paper from "1956 National Symposium on Vacuum Technology", p. 190-201, 202.

6 ref. (R1h, M21e, 1-73)

236-R.* (French.) **Lessons on Electrochemical Corrosion (Provisional Notes). Pt. 3.** M. Pourbaix. *Cebelcor, Rapport Technique no. 49,* July 1957, 65 p.

Part 3 of a series of five covering principal content of course given at University of Brussels and consisting of results of research carried on by Belgian Center for the Study of Corrosion (Cebelcor) in field of wa-

ters, electrochemistry and corrosion. Includes electrochemical oxidation and reduction; other electrochemical reactions; galvanic cells; electrochemical equilibrium diagrams of water, oxygenated water, metals and metalloids, with examples for Cu, Ag, Pb, Sn, Fe, Zn, Al and As. (R1a)

237-R. (French.) **Constitution and Morphology of the Film Formed on the Surface of Pure Iron During High-Temperature Oxidation in Steam.** Jean Paidassi and David Fuller. *Comptes Rendus,* v. 246, Jan. 27, 1957, p. 604-607.

(R1h, R4d; Fe-a)

238-R.* (French.) **Accelerated Corrosion Tests on Chemically Passivated Electrolytic Zinc Coatings on Steel.** Tadeusz Biestek. *Corrosion et Anti-Corrosion,* v. 6, Feb. 1958, p. 59-65.

Zinc coatings passivated in 15 different solutions were subjected to five types of tests and corrosion resistance of respective samples was determined. Chemical passivation appreciably increases corrosion resistance of Zn deposits by retarding appearance of white rust and corrosion of base metal. Most effective passivating solutions are listed. 6 ref. (R10c, R11; ST, *Zn*)

239-R. (German.) **Corrosion in Primary Cooling System of Nuclear Reactors.** T. Jaeger. *Maschinenbau Technik,* v. 6, Sept. 1957, p. 495-505.

Problems caused by the induced activation of impurities in the cooling medium used in nuclear reactors. 27 ref. (R4a, W11p, 3-69)

240-R. (German.) **Corrosion of Titanium in Molten Salt Baths.** M. E. Straumanis and Y. P. Huang. *Metall,* v. 11, Dec. 1957, p. 1029-1032.

246-R. New Technique for Measuring the Rate at Which a Solid Surface Is Attacked by a Corrosive Gas. *Corrosion Prevention and Control,* v. 5, Feb. 1958, p. 51-52.

New procedure at the Bureau of Standards employs time-lapse photography of the reacting solid so that a permanent record of the reaction's progress is obtained at specified time intervals. From the photographs an accurate measure of the dimensional changes and thereby the rate of change of mass of the sample can be obtained. (R11a)

247-R. Corrosion Prevention in the Bottling Industry. L. A. Johnson. *Corrosion Technology,* v. 5, Mar. 1958, p. 81-83, 94.

(R-general, L-general)

248-R.* Accelerated High Temperature Oxidation Due to Vanadium Pentoxide. K. Sachs. *Metallurgia,* v. 57, Mar. 1958, p. 123-136.

V_2O_5 found in residual oils used to run gas turbines causes severe corrosion of blades. Results of laboratory tests of this effect under different conditions. 41 ref. (R1h, R7e)

249-R.* (German.) **Intercrystalline Corrosion and Attack at Grain Boundaries.** Friedrich Erdmann-Jesnitzer. *Werkstoffe und Korrosion,* v. 9, Jan. 1958, p. 7-16.

Heat treated Al-Mg alloy showed intercrystalline attack depending on degree of disorientation. Lattice-energy and structure theories distinguish between fine, micro and macro angle grain boundaries. Attack caused by type and form of nonhomogeneous corings of one or more phases at grain boundaries of more than 5° but not by elastic-po-

tential lattice energy. 31 ref. (R2h, M27f; Al, *Mg*)

250-R.* (German.) **Velocity of Dissolution of Zinc and Influence of Inhibitors Upon Decrease of Corrosive Attack in Aqueous Agents.** T. Markovic, Z. Dugi and Lj. Rubinic. *Werkstoffe und Korrosion,* v. 9, Jan. 1958, p. 17-20.

Behavior of 99.9% Zn in aqueous acid and alkaline solutions represented in corrosion current-pH diagram. Equation for inhibition of dissolution of Zn in aqueous solutions of nitric and sulphuric acid containing sodium dichromate. 20 ref. (R10b; Zn)

251-R. (German.) **Corrosion Behavior of Nonferrous Metals in Alkalimono and Alkali Hydrogen Fluorides. Pt. 2. Aluminum in Hydrochloric Acid and Sodium Hydroxide Solutions, Containing Alkalimono and Alkali Hydrogen Fluorides.** W. Köhler. *Werkstoffe und Korrosion,* v. 9, Jan. 1958, p. 20-25.

23 ref. (R6g, R6j; Al, Mg, Si)

252-R. (German.) **Inhibition of the Corrosion of Buried Iron.** T. Markovic, D. Zagar and N. Plavsic. *Werkstoffe und Korrosion,* v. 9, Feb. 1958, p. 73-75.

12 ref. (R8, R10b; Fe, 4-60)

253-R.* (German.) **Electrochemical Measurements in Corrosion Research.** V. Cupr. *Werkstoffe und Korrosion,* v. 9, Feb. 1958, p. 76-82.

Effects of corrosion and passivity on metals and alloys explained with an apparatus which allows a continuous photographic recording of potentials and currents. Measurements are based on electrode polarizations by discontinuous currents which can be modified over a wide range, and which measure the electrode potential in the dead state. Influence of capacity on polarization current and potential. 6 ref. (R11m)

254-R.* (German.) **Cathodic Protection of Buried Refinery Equipment.** P. W. Sherwood. *Werkstoffe und Korrosion,* v. 9, Feb. 1958, p. 82-86.

Corrosion in soil in which a combined action of salt water and oxygen takes place can be prevented by a protective potential generated by direct current or by galvanic cells, and must be more negative than the corrosion potential. Anodes of Mg, Zn and Al; soil conditions, measurements of electric resistance, potential differences, protective potentials, and leakage currents; location of anode installation; horizontal and vertical anodes. 5 ref. (R10d, T29n)

255-R.* (Japanese.) **Polarization Characteristics of Aluminum and Its Alloys.** Goro Ito. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 93-106.

Polarization in chloride solution shows that the cathodic reaction is the rate-determining step and depolarization of the cathode increases the corrosion of the anode. With two dissimilar metals in contact in electrolytic solution, the corrosion current is not dependent on the open circuit potential difference but on the polarization characteristics of the couple. With Al-Cu couple in chloride solution, Cu polarizes in a more marked degree than Al and the cathode controls the corrosion reaction. Contact corrosion of Al, or various metals, with other metals can be inhibited by external e.m.f. and the potential break in cathodic polarization curve for these couples can serve as a criterion of protection. 15 ref. (R1a, Al)

256-R. (Japanese.) **Utilization of Aluminum and Its Alloys in the Wine and Brandy Industry. Pt. 1. Corrosion in Brandy.** Takuichi Morinaga, Shigeo Zaima and Motoo Kagami. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 107-109.

11 ref. (R7f, R7b, T29p, 17-57; Al)

257-R.* (English.) **Effect of Ti, V, W and Zr on the Sulphurization-Resistant Property of Cast Iron at High Temperatures.** Masakazu Shiozawa and Hiroshi Nakai. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 13-15.

Alloy specimens were exposed to hydrogen sulphide at 900° C. for 10 hr. (R6, 2-62, 2-60; CI)

258-R.* (English.) **Corrosion Resistance of Aluminum Diffusion Coated Cast Iron to Molten Caustic Soda.** Shigetomo Ueda. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 67-71.

Extent and rate of corrosion of mild steel, 17% Cr steel, 18-8 stainless steel, cast iron and Al diffusion-coated cast iron exposed repeatedly at 270° to 330° C. to molten caustic soda. (R6j; ST, SS, CI, 8-74, *Al*)

259-R. (English.) **An Electron Diffraction Study of Stainless Steel Corroded at High Temperature. Corrosion in Atmosphere Containing NH_3 Gas.** Tadayuki Nakayama. *Waseda Uni-*

versity, Castings Research Laboratory, Report, no. 8, Nov. 1957, p. 77-80.

Electron diffraction patterns of the surface layers of 13% Cr and 18-8 stainless steel corroded at 700° C. by an atmosphere containing ammonia gas. (R6p, M22h, 2-62; SS)

260-R. (French.) **Historic Copper Pipe.** *Cuivre. Laitons Alliages,* no. 41, Jan-Feb. 1958, p. 41-44.

Analysis of 70-year old pipe shows little corrosion or wear. (R-general; Cu, 4-60)

261-R. (French.) **Diffraction and Electron Microscopic Studies of Natural and Artificial Oxide Films Formed on Pure Tin and on Tinplate.** J. J. Trillat, L. Tertian and S. C. Britton. *Metaux-Corrosion-Industries,* v. 32, Dec. 1957, p. 475-481.

6 ref. (R2r, R1h, M21e, M22; Sn, 8-65)

262-R. (French.) **Corrosion in Atomic Energy Installations.** Leo. F. Epstein, H. Mogard, J. R. Weeks, C. J. Klamut, M. Silberberg, W. E. Miller, D. H. Gurinsky, etc. *Metaux-Corrosion-Industries,* v. 32, Dec. 1957, p. 490-498.

Corrosion of stainless steel by liquid metals (sodium, bismuth-uranium, lead, lead-bismuth eutectics), and zirconium and alloys by water at high temperatures. (R6m, R4d, W11p, 17-57; SS, Zr)

263-R. (German.) **Attack of Water on Aluminum at High Temperatures.** P. Lelong and J. Herenguel. *Metall,* v. 12, Mar. 1958, p. 176-179.

Corrosion of Al investigated by metallographic examination of specimens exposed to water at various temperatures. Three main stages of corrosion are formation of a homogeneous covering layer; intercrystalline effect; and asymmetric point-like corrosion. Increasing temperature accelerates the process. (R4, 2-62; Al)

264-R.* (German.) **Causes of Rapid Rust Film Formation on Cast Iron.** G. Schikorr. *Metalloberfläche,* v. 12, Mar. 1958, p. 81-84.

Chlorine ions penetrate to graphite lamellas and remain there in spite of grinding. Depth of penetration corresponds to the the length of lamellas. A 40% relative atmospheric humidity suffices to start rusting. Almost 200 microns at superficial layer must be removed to prevent rust deposition. (R3; CI)

(R2q; Fe)

268-R.* (German.) **Corrosion of Metals With Incomplete Coatings.** H. J. Engell. *Archiv für das Eisenhuttenwesen,* v. 28, Nov. 1957, p. 753-760.

Porous coatings of corrosion products such as hydroxides, oxyhydrates and carbonates, commonly referred to as rust, develop through electrolytic precipitation or through direct growth on the metal surface. This coat can be a corrosion preventing influence when it develops a cathodic protection for the base metal. The corrosion process on oil tankers and explanations of local pitting. 16 ref. (R1, R10d, R2j)

269-R.* (German.) **Formation of Flakes on Copper Wires.** E. Lindau. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 10, Oct. 1957, p. 504-509.

"Flakes" are the tiny Cu particles adhering but not bonded to the surface of Cu wires. To obtain quantitative estimate of flake formation a certain amount of wire was washed with trichlorethylene under ultrasonic excitation. Reasons for the flake formation were oxide formation during heating in oxidizing atmospheres; surface roughness of the wire during drawing; Cu grades with oxide inclusions. 3 ref. (R1h, S15; Cu, 4-61)

270-R. (Russian.) **Electrochemical Investigation of Corrosion During Comparative Moisture in Atmosphere of 100% and Less.** Yu I. Mikhalovskii and I. D. Tomashov. *Zavodskaya Laboratoriya,* v. 23, no. 12, 1957, p. 1462-1466.

7 ref. (R3, R11m)

271-R.* **Tantalum as a Corrosion Resistant Material.** F. G. Cox. *Corrosion Prevention and Control,* v. 5, Mar. 1958, p. 44-48.

Tantalum is resistant to most acids and liquid metals at elevated

temperatures but readily attacked by hydrofluoric acid and alkalies. Properties of the metal and effect of chemicals. 11 ref. (R6g, R6m; Ta)

272-R. Corrosion of Car Bodies. K. A. Murrell. *Corrosion Prevention and Control,* v. 5, Mar. 1958, p. 49-54.

Corrosion of car bodies controlled by design improvement, improved metals and finishes, new materials. (R-general, T21a)

273-R. Survey of Corrosion in Packaging. Pt. 2. D. V. Weatherley. *Corrosion Prevention and Control,* v. 5, Mar. 1958, p. 59-61.

Metal components can be protected by vapor phase inhibitors (also known as volatile corrosion inhibitors). In addition, polyethylene packs and specially treated papers have been developed. (R10e, R10b)

274-R.* Corrosion of Steel. Pt. 1. Protective Action of Oxides of Lead and Zinc. A. K. Choudhury and S. C. Shome. *Journal of Scientific and Industrial Research,* v. 17A, Jan. 1958, p. 30-34.

Results of corrosion tests and electrode potential measurement made to evaluate the protective action of aqueous extracts of pigment and paint coating on steel specimen subjected to corrosion under water. Action of aqueous extract made from dried oil paints consisting of mixtures of lead oxide and/or zinc oxide with linseed oil; protective properties of similar mixtures used as coatings. 9 ref.
(R11, L26n, L14a; ST)

275-R.* Corrosion of Steel. Pt. 2. Inhibitive Behavior of Chromates, Molybdates and Tungstates of Zinc and Lead. A. K. Choudhury and S. C. Shome. *Journal of Scientific and Industrial Research,* v. 17A, Jan. 1958, p. 35-38.

Study of corrosion inhibitive properties of zinc chromate, zinc molybdates, zinc tungstate, red lead, lead chromate, lead molybdate, and lead tungstate. Evaluates extracts made from a dried paint containing the above pigment and linseed oil. 11 ref. (R10b; ST)

276-R. Mass Transfer in Liquid Metal Circuits. A. Draycott. *United Kingdom Atomic Energy Authority,* 342/MR/157, Jan. 1957, 10 p.

Mass transfer of stainless steel constituents in a NaK circuit occurs to an appreciable extent. The amount transferred is dependent upon oxide level and temperature of the system. 4 ref.
(R2a, T11; 14-60)

277-R. (French.) **Determination of Corrosion Resistant Properties of Castings at Various Temperatures.** P. Detrez. *Corrosion et Anticorrosion,* v. 5, Dec. 1957, p. 374-382.

Users should be very specific about working conditions and temperatures in ordering "refractory castings" and foundrymen should be explicit about the qualities of their castings. Causes for poor performance or cracking are graphitization, internal stresses (thermal), corrosion, fusion of phosphorus eutectic. Corrosion causes are variety of structural constituents, diversity of gas composition, different penetration speeds of gases into casting masses.
(R-general, E-general, 5-60, 9-72)

278-R. (French.) **Corrosion Phenomena in Tubular Condensers.** A. J. Maurin. *Corrosion et Anticorrosion,* v. 5, Dec. 1957, p. 383-393.

Prevention through inhibition with potassium permanganate; cathodic protection; chlorination. (To be continued.)
(R4, R10b, R10d, R10g; Cu, ST, 4-60)

279-R. (French.) **The Fight Against Corrosion. Role and Future of Sintered Products. Pt. 1. Powder Metallurgy.** R. Meyer. *Nature,* no. 3275, Mar. 1958, p. 104-107.

(To be continued.)
(R10b, H-general)

280-R.* (French.) **Experimental Conditions for H_2S Corrosion Cracking Tests. Influence of Structure of Mild and Low-Alloy Steels on Their Life in H_2S Under Stress.** E. Herzog. *Revue de Metallurgie,* v. 55, Feb. 1958, p. 123-144.

Comparison of H_2S corrosion cracking phenomena resulting from variety of bending and tensile tests. Factors influencing failures. Investigation facilitated choice of satisfactory steel for piping used at only natural gas deposit in France, where gas has a 15% H_2S content. 8 ref.
(R11s; CN, AY)

281-R* (German.) **Speed of Scaling of Pure Iron in Oxygen at Diminished Pressures and in Carbon Dioxide.** Norbert G. Schmahl, Hans Baumann and Hermann Schenck. *Archiv für das Eisenhüttenwesen,* v. 29, Mar. 1958, p. 147-152.

Velocity of scaling of electrolytic iron at 950° and at varying pres-

sures. A linear relationship is found at lower pressures, a parabolic at higher pressures. Annealing of iron in pure carbon dioxide at 950° produces fine crystalline scale; no definite conclusions can be given on scaling regularity. Velocity of scaling is greater with increasing oxygen pressure. (R2q, 3-74; Fe-a)

282-R.* (German.) **Corrosion Behavior of Artificially Produced Hard Zinc Coats.** W. Rädeker. *Metalloberfläche,* v. 12, Apr. 1958, p. 102-104.

Composition and some properties of Zn-Fe alloyed coat; heat treatment. Corrosive effect of atmosphere on treated coat in laboratory and in natural conditions; optimal treatment temperature; limited application of method in practice. (R3, J-general; *Zn*)

283-R.* (Italian.) **Corrosion of Metals at High Temperature by Vanadium Anhydride. Behavior of Alloys Containing Titanium.** A. Burdese and S. Gallo. *Metallurgia Italiana,* v. 50, Jan. 1958, p. 8-14.

Test pieces of Cr, Co and Ni alloys containing Ti were subjected to attack at 700° C. in air and V_2O_5-saturated room for periods of 300 hr. Micrographic and X-ray studies were made of structure of materials used, of mechanism of formation, thickness and constitution of oxide films formed. Presence of Ti improves resistance to hot oxidation in presence of V_2O_5. Observed improvement is related to high stability and thickness of protective film. However, addition of Ti to Ni alloys must be limited as it causes excessive brittleness. 36 ref. (R6p, 2-62, 2-60; Cr, Co, Ni, *Ti*)

284-R.* (Italian.) **Zinc Powder and Zinc Oxide Base Anti-Rust Paints.** Giancarlo Ghisolfi. *Pitture e Vernici,* v. 13, Dec. 1957, p. 833-842.

Anti-rust protection provided by mixtures of Zn powder and Zn oxide in paints with chemically inert bases and oily bases evaluated by salt spray tests and measurement of electrical potential and voltage in corrosion cells. Films produced by paints studied were applied to inert bases, then investigated for permeability, ease of absorption of solutions, possibilities of reaction with electrolytes. Paints with zinc powder-zinc oxide bases in chemically inert vehicle and having composition very similar to that of a Zn-rich paint develop efficient anti-rust action. 5 ref. (R11; NM-g30)

285-R. Service Blistering of Plated Zinc Alloy Die-Castings. V. E. Carter and J. Edwards. *Metal Industry,* v. 92, Mar. 1958, p. 191-192.

(R2n, 5-61; Zn-b, 8-62)

286-R. Cast Stainless Pump Handles Corrosive Electrolytes. E. A. Schoefer. *Plating,* v. 45, Apr. 1958, p. 366-367.

(R6, W13d, 17-57; SS)

287-R. (Czech.) **Effectiveness of Cathodic Protection of Sprayed Metal Coatings (Anodes) in River Water.** M. Svoboda, K. Kolar and B. Knapek. *Korose a Ochrana Materialu,* v. 1, no. 7-8, 1957, p. 107-109.

(R10d, R4a, 8-67; Zn, Al, Mg, 8-67)

288-R. (French.) **Relation Between the Intensity of the Cathodic Protection Current and the Intensity of the Stray Current Circulating in Metallic Underground Pipes.** S. Minc and Z. Feldblum. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 308-314.

(R10d; 5-60)

289-R. (French.) **Special Pipe for Lacq Gas Fields.** A. Madrelle. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 327-330.

Tubing made of special steels (Mn, Mo; Cr, Al, Mo) to resist corrosion by H_2S. (R6g; ST, 4-60)

290-R. (French.) **Determination of Thickness Reduction of Sheet Metals and Steel Pipes Caused by Corrosion.** M. G. Pirou. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 339-347.

Different procedures to determine corrosion including photographic, television, acoustic, ultrasonic, radiographic, electric and magnetic methods. Magnetic is recommended as best. (R11, S14; ST, 4-53, 4-60)

291-R. (French.) **Determination of the Properties of Corrosion Resistant Castings at Different Temperatures.** P. Detrez. *Corrosion et Anticorrosion,* v. 5, Dec. 1957, p. 374-382.

A table of principal characteristics of castings relative to such conditions as temperature at which utilized, whether machined or not, whether under large or small strains, and whether required to withstand thermal shocks. (R2, 2-61, 5-60)

292-R. (French.) **Study of the Intercrystalline Corrosion of 18-8 Stainless Steel by Observation of Internal Friction.** M. Smialowski and W. Drozd. *Corrosion et Anticorrosion,* v. 5, Dec. 1957, p. 394.

(R2h; SS)

293-R. (French.) **Corrosion Test Methods.** W. Wiederholt. *Corrosion et Anticorrosion,* v. 6, Mar. 1958, p. 80-100.

Following types of tests were conducted: exposure to humidity at a constant temperature and at a variable temperature between 20 and 40° C., at a variable temperature in an atmosphere of SO_2 or CO_2, immersion in saline mist, alternate immersion in 3% NaCl solution. (R11j, R11q)

294-R.* (French.) **Study of Intercrystalline Corrosion by Hydrochloric Acid of Very High-Purity Aluminum and Aluminum Purified by the Zone-Melting Technique.** F. Montariol. *Corrosion et Anticorrosion,* v. 6, Mar. 1958, p. 101-106.

Influence of the state of purity of the metal on the selective corrosion at grain boundaries of very high-purity Al in hydrochloric acid. Corrosion is slower for metal of the higher purity, and is accelerated by certain additives (ethyl alcohol) to the attacking agent. 13 ref. (R6g, R2h; Al-a)

295-R.* (German.) **Influence of Temperature Upon the Development of Scale on Pure Iron Exposed to Oxygen.** Norbert G. Schmahl, Hans Baumann and Hermann Schenck. *Archiv für das Eisenhüttenwesen,* v. 29, Feb. 1958, p. 83-88.

A new method for the precise determination of constants in the scaling process of pure iron between 480 and 1080° C. 34 ref. (R2q, 2-62; Fe-a)

296-R.* (German.) **Periodic Dissolution of Iron in Soils. Atmospheric Corrosion in Presence of Hydrogen Chloride.** P. Kirkov. *Werkstoffe und Korrosion,* v. 9, Mar. 1958, p. 146-149.

Changes of periodic dissolution are indicated by maximum and minimum solubility curves. Changes are caused by hydroxide layers as corrosion products. Process tends toward a state of equilibrium between acid diffusion and metal dissolution. A new protective layer can result from solubility of the hydroxide layer in the mineral acids. Velocity and mechanism are determined. 9 ref. (R8, R3; Fe)

297-R. (German.) **Corrosion Current-pH Value Diagram of Lead in Dilute Electrolytes.** T. Markovic and V. Bestvina. *Werkstoffe und Korrosion,* v. 9, Mar. 1958, p. 152-154.

Velocity of Pb dissolution in pH range of 1-13. 18 ref. (R1a; Pb-a)

298-R. (Rumanian.) **Qualitative Research on Corrosion Protection Afforded by Protective Coatings.** M. Ciortea. *Petrol si Gaze,* v. 9, Jan. 1958, p. 37-42. (R11, L26)

299-R. Corrosion—What Causes It and How It Happens. Pt. 1. W. A. Koehler. *American Gas Journal,* v. 185, Mar. 1958, p. 24-25. (R1)

300-R. Development of a Cubic Oxide Protective Film on Zirconium. James R. Johnson. *AIME Transactions,* v. 212, Feb. 1958, p. 13-14.

Cubic ZrO_2 is more stable to neutron damage than monoclinic ZrO_2. Small additions of other oxides with ZrO_2 were reacted at 1500° C. and the amounts of cubic phase formed, if any, were determined by X-ray diffraction. Columbium appears to be the most promising alloy for development. (R1h, P18; Zr)

301-R. Zirconium and Titanium Inhibit Corrosion and Mass Transfer of Steels by Liquid Heavy Metals. O. F. Kammerer, J. R. Weeks, J. Sadofsky, W. E. Miller and D. H. Gurinsky. *AIME Transactions,* v. 212, Feb. 1958, p. 20-25.

Zirconium and titanium inhibit solution mass transfer of steels by liquid Bi, Hg and Pb. Bi and Hg absorb on the surface of the steels and subsequently react with nitrogen and possibly carbon to form inert, adherent surface layers of ZrN, TiN, or TiN + TiC. Conditions under which these deposits form. 16 ref. (R2a, R10b; ST, *Zr, Ti*)

302-R.* **Corrosion Mechanism of Uranium-Base Alloys in High Temperature Water.** M. W. Burkart and B. Lustman. *AIME Transactions,* v. 212, Feb. 1958, p. 26-30.

Uranium-base alloys exposed to high-temperature water fail either by uniform oxidation or by sudden cracking and disintegration. Disintegration results from the oxidation of a second phase which is precipitated during the corrosion process. The precipitate has been identified as a metastable hydride. 9 ref. (R4, 2-62; U-b)

303-R.* **Prolonged Oxidation of Zirconium at 350 and 450° C.** Robert G. Charles, Sidney Barnartt and Earl A.

Gulbransen. *AIME Transactions,* v. 212, Feb. 1958, p. 101.

Reaction of Zr with oxygen at 1 atm. pressure was followed at 350 and 450° C. for 500 and 200 hr., respectively. Extrapolation of short-term oxidation data for Zr to obtain the long-term behavior is best done through the cubic equation $w^3 = k_c t$ + constant. 5 ref. (R1h; Zr)

304-R.* Oxidation Rate of Molybdenum in Air. E. S. Bartlett and D. N. Williams. *AIME Transactions,* v. 212, Apr. 1958, p. 280.

Values at temperatures from 1400 to 2150° F. (R1h, 2-61; Mo)

305-R.* Oxidation of Zircaloy-2 and 3A at 300 to 850° C. E. A. Gulbransen and K. F. Andrew. *AIME Transactions,* v. 212, Apr. 1958, p. 281-286.

From 500 to 750° C. the alloys oxidized at a faster rate than pure Zr while below 500° C. the pure metal reacted at a faster rate. The cubic-rate law fits the data best for the abraded specimens. Rate data for chemically polished specimens show a good fit to the parabolic-rate law. 19 ref. (R1h; Zr-b)

306-R.* Intergranular Corrosion Resistance of Austenitic Stainless Steels. A Ferric Sulfate-Sulfuric Acid Test. Michael A. Streicher. *ASTM Bulletin,* no. 229, Apr. 1958, p. 77-86.

A specific test for determining intergranular attack on chromium carbide precipitation in unstabilized steels. Samples are exposed to boiling 50% sulphuric acid and ferric sulphate for 120 hr. Comparison of two specimens—annealed (resistant to attack) and sensitized (heated 1 hr. at 1250° F.) gives difference between general and intergranular corrosion. 19 ref. (R11, R2h; SS-e)

307-R. Corrosion and the Destination of Corrosion Products in a High Pressure Power Plant. Ross C. Tucker. *Corrosion,* v. 14, May 1958, p. 19-22.

Water conditioning, feedwater and steam concentrations, corrosion of steam lines, turbine blade deposits, the collecting of dissolved gases in condensers and dissolved oxygen scavengers. 9 ref. (R4c, W11k)

308-R.* Cathodic Protection of Lead Cable Sheath in the Presence of Alkali From Deicing Salts. Walter H. Bruckner and W. W. Lichtenberger. *Corrosion,* v. 14, Apr. 1958, p. 165t-170t.

Potential gradient tests provide information on effects of salt concentration, pH and potential on corrosion behavior of lead when partially and fully immersed. Criteria for effective cathodic protection are different for portions of lead cathodes below and above the water line. Conditions at the air solution interface require a more negative voltage for protection than below the interface. (R10d, T1b; Pb)

309-R. Basic Concepts and Practical Aspects of Field Corrosion Investigation. Maurice A. Riordan. *Corrosion,* v. 14, Apr. 1958, p. 171t-174t.

Relates electrical measurements to corrosion characteristics of structural metal systems in soil or water. (R4, R8)

310-R.* An Electrical Resistance Method of Corrosion Monitoring in Refinery Equipment. A. J. Freedman, E. S. Troscinski and A. Dravnieks. *Corrosion,* v. 14, Apr. 1958, p. 175t-178t.

Corrosion decreases cross section and consequently the electrical conductivity of metal specimens exposed to refinery fluids at high temperature and in inaccessible locations. Rate of corrosion determined by increase in resistance. Technique successfully used under many conditions of temperature and pressure in vapor and liquid phases with both oil and aqueous media. Allows rapid quantitative determination of corrosion rate and evaluation of effect of operating procedure in corrosion inhibitors. 6 ref. (R11a, R7a)

311-R.* High Temperature Oxidation of Iron-Nickel Alloys. M. J. Brabers and C. E. Birchenall. *Corrosion,* v. 14, Apr. 1958, p. 179t-182t.

Alloys containing 15 to 89% Ni were oxidized in oxygen in brief stages at 1050° C., and equilibrated in argon atmosphere between stages and following oxidation. Metallographic, X-ray diffraction and chemical investigation indicated subscale formed preferentially at grain boundaries. Porosity developed in subscale regions during equilibration, then began to sinter out on longer heating. Clarifies features of iron-rich corner of ternary phase diagram. Structure and composition of wustite and spinel in sub-

scale and outer scale and relative growth rates of these phases. 18 ref. (R1h, M24c; Fe, Ni, O)

312-R.* Controlling Corrosion in Coal-Chemical Plants. C. P. Larrabee and W. L. Mathay. *Corrosion,* v. 14, Apr. 1958, p. 183t-186t.

Resistance of carbon steel, galvanized steel, copper steel, types 304, 316 and 410 stainless steels to corrosive environment in coal chemical plant. Corrosion and surface tests with coal handling equipment, primary coolers, ammonia saturators, light oil recovery equipment and tar stills. 9 ref. (R7d; CN, AY, SS)

313-R.* Reaction of Certain Chlorinated Hydrocarbons With Aluminum. A. C. Hamstead, G. B. Elder and J. C. Canterbury. *Corrosion,* v. 14, Apr. 1958, p. 189t-190t.

Type 3003 Al transfer line failed after handling refined propylene dichloride for a few hours. Laboratory investigation of nature and rate of reaction between Al and propylene dichloride. (R7g; Al)

314-R.* Statistical Concepts in the Testing of Corrosion Inhibitors. C. C. Nathan and E. Eisner. *Corrosion,* v. 14, Apr. 1958, p. 193t-199t.

Static and dynamic corrosion tests with both synthetic fluids and actual fluids from producing oil wells. Fluctuation in weight losses of steel test coupons; variation in rate of attack with concentration of organic adsorption type inhibitors. Statistical analysis of data. 17 ref. (R10b, S12, R7a; ST)

315-R.* Cathodic Protection of Iron in the Temperature Range 25 C—92 C. G. R. Hoey and M. Cohen. *Corrosion,* v. 14, Apr. 1958, p. 200t-202t.

Fluctuations in corrosion rate of iron specimens immersed in sodium chloride solutions observed for various current densities and temperatures. Cathodic polarization curves for iron in 110-ppm. sodium chloride solutions. Corrosion products analyzed by X-ray. Limiting protective current density and open circuit cathodic current density went through temperature maximum at approximately 75° C. Unsteady potentials observed in vicinity of limiting protective current. Current density at which the potential of the iron reaches minus 0.5 volt on the hydrogen scale gave satisfactory potentials. 16 ref. (R10d; Fe)

316-R.* Corrosion Rates of Mild Steel in NH_4NO_3-H_2O Solutions. Norman Hackerman, Ray M. Hurd and Earl S. Snavely. *Corrosion,* v. 14, Apr. 1958, p. 203t-205t.

Corrosion rates of SAE 1021 steel in mixture of ammonium nitrate, ammonia and water were measured at temperatures of 30, 45 and 60° C. Effectiveness of thiocyanate, thourea, 2-mercapto-ethanol and sodium arsenite in inhibiting corrosion. Completely stress-relieved coupons would not corrode. Rate of uninhibited reaction much lower at 45 and 60° C. than at 30° C. 6 ref. (R7j, R10b, 3-66; CN)

317-R.* Effects of Cold Working on Corrosion of High Purity Aluminum in Water at High Temperatures. M. J. Lavigne. *Corrosion,* v. 14, May 1958, p. 226t-228t.

In distilled water at 100° C., high-purity Al cold worked 5 to 50% and all the recrystallized Al samples corrode intergranularly, but materials cold-worked 60% and over are immune. 5 ref. (R4, 2-62, R2h, 3-68; Al-a)

318-R. Methods for Increasing the Corrosion Resistance of Metal Alloys. N. D. Tomashov. *Corrosion,* v. 14, May 1958, p. 229t-236t.

With corrosion controlled by oxygen diffusion, cathodic inclusions do not notably accelerate corrosion. When it is possible to establish prevalent anodic control, cathodic inclusions may promote passivation and consequently considerably reduce the rate of corrosion. 56 ref. (R10d)

319-R.* Corrosion of Zinc by Differential Aeration. G. Bianchi. *Corrosion,* v. 14, May 1958, p. 245t-248t.

Corrosion in molar NaCl solutions under varying conditions of aeration, pH and test time. Formation of differential aeration macrocells is due to passivity of Zn on the zones of the specimen where cathodic reduction of oxygen takes place. The principal process of corrosion is accompanied by local corrosion processes at the cathodic and anodic areas of the macrocell. 4 ref. (R6j, R10c, Zn)

320-R.* The Mechanism of Stress Corrosion of Austenitic Stainless Steels in Hot Aqueous Chloride Solutions. K. W. Leu and J. N. Helle. *Corrosion,* v. 14, May 1958, p. 249t-254t.

Investigation proves that the initial corrosive attack is dependent primarily on the mechanical and chemical behavior of the passivating film already present on the steel or formed during exposure to the corrosive medium and only to a minor extent on the structure of the metal itself. 11 ref.
(R1d, R6j; SS)

321-R.* The Acetic Acid Salt Spray Test. J. H. Hooper. *Institute of Metal Finishing, Bulletin,* v. 8, Spring 1958, p. 79-90.

Relative merit of 1% acetic acid, 5% salt spray tests and other accelerated tests. Found 24-hr. sulphur dioxide test most suitable for Cr-Ni and Cr-Ni-Cu plating on steel; hot or cold acetic acid tests for similar coatings on Zn or brass; hot acetic acid method for anodized high-purity Al. No correlation was found between results with straight 5% salt spray tests and corrosion occurring under atmospheric exposure. 8 ref.
(R11j; ST, Zn, Cu, Al, 8-12)

322-R. Relationship Betwen Magnesium Content and Stress-Corrosion Susceptibility of Aluminium-Magnesium Alloys. W. J. Vance. *Journal of Applied Chemistry,* v. 8, Jan. 1958, p. 18-23.

15 ref. (R1d, 2-60, Al, *Mg*)

323-R. Corrosion in High-Purity Water. *Metal Industry,* v. 92, Apr. 25, 1958, p. 330-333.

(R4e; Ni, Al)

324-R.* Accelerated High Temperature Oxidation Due to Vanadium Pentoxide. K. Sachs. *Metallurgia,* v. 57, Apr. 1958, p. 167-173.

How vanadium pentoxide increases oxidation of Ni, Ni alloys, steel, stainless steel, aluminium bronze and other metals when exposed to high-temperature air or oxygen. Fluxing effect of vanadium pentoxide and resultant increase in diffusion of metal and oxide ion through the protective oxide films. Chemical attack and other secondary effects. Importance of vanadium pentoxide in fuel ash of gas turbines. (To be continued.) 41 ref. (R7d, R1h; Ni, ST, SS, Cu-s)

325-R.* Corrosion of Lead-Base Babbitt Metal. C. I. R. McDougall and E. Klar. *Ontario Hydro Research News,* v. 9, July-Sept. 1957, p. 19-22, 26.

Alloys No. 7 and 8 with 5 and 10% Sn resisted corrosion under all conditions. Alloy No. 15 with 1% Sn resisted corrosion under most circumstances, even when in contact with highly acidic oil. However, when water was present in same oil, a very marked interaction was evident, oil deteriorated rapidly and babbitt surface was corroded. (R7e; Pb, *Sn,* SGA-c)

326-R.* Atmospheric Exposure Tests of Different Types of Electrodeposited Nickel. J. Edwards. *Product Finishing,* v. 11, Mar. 1958, p. 58-66.

Resistance to corrosion in industrial and marine environments of Ni deposited from sulphate-chloride solutions is virtually independent of the additions made to the baths in order to promote brightening, leveling, low stress and so on. This is true whether or not the deposit has a top coat of Cr, provided that the quality of the Cr on different types of Ni undercoat is the same. 7 ref. (R3n, R3p; *Ni,* 8-62)

(R6g, R10c, 2-64, 3-64; SS)

341-R.* (French.) **Long-Term Corrosion Tests on Painted Steel Exposed to Atmosphere.** Paul Nylen. *Peintures, Pigments, Vernis,* v. 34, Mar. 1958, p. 116-117.

Corrosion Committee of Royal Academy of Sciences of Sweden has, since 1938, carried out several series of extended tests on plates painted with different types of paints and exposed to atmosphere in various parts of Sweden. Results are reported in terms of influence of climate and nature of paint on intrusion of rust. (R3; ST, 8-70)

342-R.* (French.) **Effect of Low-Temperature Stress Relieving on Stress-Corrosion Cracking.** C. R. McKinsey. *Revue de la Soudure,* v. 14, no. 1, 1958, p. 42-48.

Welded structures are susceptible to stress-corrosion because of the residual stresses that are generally present. A series of tests for determining the effect of low-temperature stress relieving on the stress-corrosion of arc butt welded steel plates showed that stress-corrosion increases with decrease in carbon content and that controlled relieving at low temperature reduces susceptibility of welded plates to stress-corrosion. 11 ref.
(R1d, J1a; ST, 7-51)

343-R.* (German.) **Effect of Small Additions of Antimony on Oxidation Velocity of Lead.** Helmut Hartmann, Wilhelm Hofmann and Wolfgang Stahl. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 11, Apr. 1958, p. 151-163.

Preliminary experiments at 350-500° on tarnishing velocity. Gravimetric determination of oxidation velocity at 600 and 750° and explanation of its results according to the scaling theory. Surface tension is dependent on Sb content.
(R2q, R2r, 2-60; Pb, *Sb*)

344-R.* (Italian.) **Biological Corrosion in a Hydro-Electric Plant in Africa and Role of Organic Products in the Corrosion Process.** Pierre Coulomb. *Vernici*, v. 14, Jan. 1958, p. 69-71.

Corrosion behavior of standard bituminous coatings in installation in Belgian Congo. Factors included aggressivity of waters and abundant deposits of sludge. However, no bacteria of known corrosive action were found in sludge. Harmful action of sludge was therefore attributed to presence of aminic acids and bases, as revealed by chemical analysis and chromatography. Presence of these materials also explains unexpected resistance to corrosion of some red lead paints. (R1g, L26a)

345-R. Influence of Bicarbonate Ion on Inhibition of Corrosion by Sodium Silicate in a Zinc-Iron System. Henry L. Shuldener and Leo Lehrman. *American Water Works Association, Journal*, v. 49, Nov. 1957, p. 1432-1440.

21 ref. (R10b; Zn, Fe)

346-R.* **Fretting Corrosion of Cast Iron.** F. T. Barwell and K. H. R. Wright. *British Cast Iron Research Association, Journal of Research and Development*, v. 7, Apr. 1958, p. 190-202.

Fretting behavior of 12 different cast iron surfaces investigated under seven conditions of lubrication, including the dry condition. Lubricated specimens in the as-cast condition are less susceptible to fretting than annealed specimens. Liquid lubricants appear to be slightly more effective than greases. (R1f; CI, NM-h)

347-R.* **The Influence of Silicon Content on the Growth and Scaling Resistance of Cast Iron With Nodular Graphite.** R. J. Maitland and I. C. H. Hughes. *British Cast Iron Research Association, Journal of Research and Development*, v. 7, Apr. 1958, p. 203-223.

Growth and scaling behavior of nodular irons with 1.2 to 5.7% Si at temperatures within the range 650 to 1000° C. Both growth and scaling proceed relatively slowly and are inhibited by increasing Si contents at temperatures below the austenite transformation range. When the critical temperature range is exceeded or nearly exceeded, growth and scaling become excessive and seem to be promoted by Si. 21 ref. (R2q, 2-60; CI-r, Si)

348-R.* **The Corrosion Resistant Properties of Zirconium. Pt. 1.** F. G. Cox. *Corrosion Prevention and Control*, v. 5, Apr. 1958, p. 39-42.

Purity of Zr affects its corrosion resistance. Low-carbon (0.04%) Zr metal is attacked by HF concentrated H_2SO_4, and solutions of $FeCl_3$ and $CuCl_2$; and is resistant to HCl, H_3PO_4, dilute H_2SO_4 and alkalies. Special alloys, developed for high-temperature use with water. (To be continued.) (R6, 64; Zr)

349-R. The Protection of Overhead Electric Conductors. J. A. Airey. *Corrosion Prevention and Control*, v. 5, Apr. 1958, p. 44-45.

Special coating developed to protect electrical power transmission cables from corrosion, especially in coastal areas. (R3, T1b, L26p)

350-R. An Accelerated Corrosion Test Chamber. W. Hess. *Corrosion Prevention and Control*, v. 5, Apr. 1958, p. 47-51.

Test chamber allowing for atmospheric conditions contains a transparent enclosure, test agents admitted as aerosols and humidity and temperature control features. (R11j, R3, 1-53)

351-R. The Protection of Motor Vehicles From Corrosion. *Corrosion Prevention and Control*, v. 5, Apr. 1958, p. 52, 54, 73.

The combination of sodium benzoate and sodium nitrite have been effective corrosion inhibitors in automobile radiators with or without ethylene-gylcol antifreeze. Automobile mufflers may be protected from corrosion by the use of Zn-coated steels or Zn paints. Al alloy parts are lighter and anodized parts are effective for trims. (R10b, T21c, L16, L26; Al-b)

391-R.* Corrosion of Metals in Ethylene Glycol Solutions. R. J. Agnew, J. K. Truitt and W. D. Robertson. *Industrial and Engineering Chemistry,* v. 50, Apr. 1958, p. 649-656.

Corrosion of hot rolled steel, cold rolled Cu and brass, Al and cast Fe under various pH and temperature conditions. 12 ref.
(R7f; ST, Cu, Al, CI)

392-R.* The Corrosion of 2½% Cr-1 Mo Steel by Liquid Bismuth. G. W. Horsley and J. T. Maskrey. *Iron and Steel Institute, Journal,* v. 189, June 1958, p. 139-148.

Dynamic corrosion of supeheater tubing by liquid bismuth studied in thermal convection loops working with maximum temperatures up to 625° C., temperature gradients up to 150° C., and fluid velocities of 3-4 mm. per sec. Effect of adding 250-500 ppm. Zr to the Bi as an inhibitor. 8 ref. (R6m; AY, *Bi*)

393-R.* Formation of the Delta-Phase by Oxidation of Alpha-Titanium. I. Koncz and M. Koncz-Deri. *Periodica Polytechnica,* v. 1, no. 1, 1957, p. 67-87.

Oxidation of iodide titanium studied in a range of 570 to 820° C., and a pressure of 2 to 5 mm. Hg in pure oxygen, for periods up to 210 min. Dense, adherent oxide layers show rectifying properties; the presence of delta-phase Ti in these layers verified by X-ray analysis. Diffusion coefficient of oxygen in alpha Ti determined. Possible explanation for mechanism of the oxidation process. 12 ref.
(R1h, N1b; Ti)

394-R. Effects of Carbon Content on the Rate of Dissolution of Dingot Uranium in Nitric Acid. A. L. Bement and J. L. Swanson. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-52430, Nov. 11, 1957, 20 p. (Order from Office of Technical Services, Washington 25, D. C.) $.75.

Carbon additions made to dingot uranium by vacuum casting with a high-frequency electronic heater varied from 150 to 1500 ppm. The specimens were beta heat treated, then dissolved in nitric acid. Dissolution rates were determined for the linear, initial portion of the weight-loss-versus-time curves. The rates so obtained were compared with those for samples of ingot, and normal and high-carbon dingot uranium. The effect of grain size on the dissolution rate can be expressed as a power function.
(R6g, 2-60; U)

395-R.* Pit Depth Measurements as a Means of Evaluating the Corrosion Resistance of Aluminum in Sea Water. T. J. Summerson, M. J. Pryor, D. S. Keir and R. J. Hogan. Paper from "Metals", ASTM STP No. 196, p. 157-175.

Quantitative method based on a statistical treatment of penetrometer measurements of every pit present on test specimens immersed in sea water for periods up to 24 months. Normal frequency distributions were obtained by plotting the frequency of pitting against the square root of the pit depth. Calculations of the mean square root pit depth, the standard deviation and standard error of the mean square root pit depth are shown. 10 ref.
(R11, R4b, S12; Al)

396-R. Corrosion of Uranium, Thorium, and Uranium Alloys in Sodium and Organics. Harry Pearlman. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, TID-7546, p. 565-587.

Corrosion rate of uranium and its alloys depends strongly on the impurity and content (especially oxygen) of the liquid metal. In capsule-type static corrosion experiments, made with liquid metal with oxygen content near 0.01% (100 ppm.), corrosion rates are of the order of 10 mg. per sq. cm. per month at temperatures up to 750° C. UO_2 and UO have been identified as corrosion products. 30 ref.

397-R.* (French.) **Chromium-Aluminum Steels, Their Properties and Applications.** E. Herzog. *Corrosion et Anticorrosion,* v. 6, Apr. 1958, p. 117-126.

Principal characteristics of Cr-Al steels. Resistance to fissuring in solutions of nitrates and in hydrogen sulphide. Surface condition and corrosion rate; transformations and mechanical properties; results of corrosion tests.
(R-general; AY, *Cr, Al*)

398-R.* (French.) **Study of the Internal Corrosion of Pipes in the Transport and Distribution of Purified City Gas Under Various Pressures.** J. Mor-

let. *Corrosion et Anticorrosion,* v. 6, Apr. 1958, p. 127-131.

Extent to which the corrosive action of purified city gas on soft steel pipe, in the absence or presence of condensed water, depends on its oxygen and carbon dioxide content and on pressure. Corrosion was found to be independent of pressure and of CO_2 content. Possibility of considerably decreasing the corrosive action of purified city gas by limiting its oxygen content or by dehydrating it, the latter being the more effective procedure.
(R7g; CN, 4-60)

399-R.* (French.) **Stress-Corrosion of Aluminum Alloys.** F. A. Champion. *Corrosion et Anticorrosion,* v. 6, Apr. 1958, p. 132-140.
21 ref. (R1d, Al-b)

400-R. (French.) **Corrosion Control in Industry.** J. Strebelle and M. Stassin. *Métaux Corrosion-Industries,* no. 391, Mar. 1958, p. 115-124.
Problems of corrosion classified according to their characteristics and the protective means most frequently applied. Illustrations of typical corrosion in industrial machinery. (R-general, R10)

401-R.* (French.) **Rapid Detection and Location of Corrodibility in Protective Coatings on Metal.** G. Blet. *Peintures, Pigments, Vernis,* v. 34, Apr. 1958, p. 160-163.
Tests of a nonconductor coating on iron base, completed in 2 hr. by use of porosimeter, confirmed by salt spray tests requiring three weeks and costly equipment. Porosimeter is useful for rapid check of corrosion potential, but will not reveal existence of blind pores beneath surface of coating which can become source of rapid corrosion if even slight abrasion occurs.
(R11, 1-53; Fe, 8-70)

402-R.* (Japanese.) **Effect of Manganese and Chromium on the Characteristics of Aluminum-Magnesium (3-5%) Wrought Alloys. Pt. 2.** Rihei Kawachi. *Light Metals (Tokyo),* v. 8, Mar. 1958, p. 14-23.
To confirm the effect of Mn on the Al-Mg alloy as well as the effect of Fe, Si, Cu and Ti on an alloy of 4-4.5% Mg, 0.5% Mn, and 0.2% Cr, with respect to corrosion resistivity and changes of tensile strength, samples were immersed in sea water for up to 12 months. Al-Mg binary alloys are best; addition of Mn, Cr, Fe or Cu decreases corrosion resistance; effects of Si, Zn and Ti are small.

405-R. Thermogalvanic Corrosion. V. V. Gerasimov and I. L. Rozenfeld. *Academy of Sciences, Bulletin,* no. 1, 1957, p. 29-31. (Translation by Consultants Bureau, Inc.)
Thermogalvanic corrosion depends on the potential difference between the cold and hot electrodes, the electrical conductivity of the solution, the distance between the electrodes and the overvoltages of the anode and cathode processes. Thermogalvanic corrosion of Fe, Cu, Ni and Pb in neutral, alkaline and acid solutions investigated for different temperature differences and relative electrode areas and with and without stirring of the electrolyte. 4 ref.
(R1a; Fe, Ni, Cu, Pb)

406-R.* Quantitative High-Temperature Oxidation of Porcelain Enameled Iron. H. G. Lefort and A. L. Friedberg. *American Ceramic Society, Journal,* v. 41, June 1, 1958, p. 216-226.
Oxidation studied as a function of time and temperature on both bare and enameled iron. Specimens were subjected to variations in enamel thickness, thickness of electroplated nickel deposit, and surface preparation of the iron. The rate of oxidation of enameled iron was lower than that of bare specimens at all temperatures.

schrift für Elektrochemie Berichte der Bunsengesellschaft für Physikalische Chemie, v. 62, no. 2, 1958, p. 201-209. (R6j, R1h; Ti)

436-R.* Corrosion-Resistance of Spheroidal-Graphite Iron. F. L. LaQue. *Foundry Trade Journal,* v. 104, June 12, 1958, p. 711-714.

Galvanic behavior; resistance to acid corrosion; corrosion by sea water; atmospheric corrosion; underground corrosion. (R-general; CI-r)

437-R. Rate of Oxidation of Copper in Nitric Acid. N. N. Milyutin and A. I. Shultin. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 57-60. (Translation by Consultants Bureau, Inc.)

Increase of temperature greatly increases the oxidation rate of Cu without affecting the linear relationship between the logarithm of the oxidation rate and the potential. The step which determines the oxidation rate is the electrochemical reaction at the Cu surface at moderate nitric acid concentrations, and probably the diffusion of oxidant to the surface at nitric acid concentrations above 11 molar. 9 ref. (R1h, R6g; Cu)

438-R.* Iridium as a High-Temperature Material. F. D. Richardson. *Platinum Metals Review,* v. 2, July 1958, p. 83-85.

Iridium crucibles were completely resistant to attack by Pb at 1000 to 1500° C. The crucibles lost weight slightly during use and became etched in appearance, whether they held slags or metal. The metal grains so revealed ranged up to 1 mm. across. Typical losses of Ir were: 0.0002 g. into 18 g. lead in 444 hr. at 1000° C.; 0.0014 g. into 20 g. slag and 20 g. lead in 144 hr. at 1000° C. 6 ref. (R6m; Ir, Pb)

439-R.* Behavior of the Platinum Metals at High Temperatures. A. R. Powell. *Platinum Metals Review,* v. 2, July 1958, p. 95-98.

Behavior of Pt, Rh and Pd in oxygen at high temperatures. Pt is the most, and Pd the least, volatile up to 1200° C., whereas at 1300° C. there is relatively little difference in the volatility of all three. The volatility of Pt in oxygen at 900-1100° C. is appreciably reduced by alloying it with Pd or Rh. 9 ref. (R1h, 2-62; EG-c)

440-R.* Corrosion of Mild Steel in Alkaline Pulping Liquors. Pt. 1. Kraft White Liquor. Richard B. Kesler and James F. Bakken. *Tappi,* v. 41, Mar. 1958, p. 97-102.

The effect of the presence of appreciable quantities of sodium chloride, sodium sulphate and sodium carbonate in kraft white liquor on the corrosion rate of mild steel in white liquor. 11 ref. (R7p, T29R; CN)

441-R. A Basic Study of Corrosion of Magnesium. R. R. Addiss. Cornell University. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131662, Dec. 1957, 57 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Structure of the surface; process of formation and structure of surface films appearing during corrosion. Attempts to obtain a perfectly clean surface, both by cleaning a contaminated surface and by producing a new, clean surface in vacuum. Studies of oxidation of surfaces covered with the "first film", aimed at measuring the oxidation rate and investigating the relative crystallographic orientation of the metal and the oxide. (R-general; Mg)

442-R.* (German.) **Investigation of Sulphur Attack on Nickel and Nickel Alloys.** Irmtraud Pfeiffer. *Zeitschrift für Metallkunde,* v. 49, May 1958, p. 267-275.

Kinetics of sulphurizing reaction at 620°. Rate of sulphide formation is dependent on alloying additions. Microscopic study of sulphide layers; intercrystalline corrosion. (R7k, 2-60; Ni)

443-R.* (Italian.) **Electron Microscopic Examination of Oxide Film Formed on Aluminum by Hot Oxidation.** M. Paganelli. *Alluminio,* v. 27, Apr. 1958, p. 159-164.

Film formed on Raffinal annealed at about 620° C. is gamma Al_2O_3, cubic spinel. Under microscope this film presents a pseudo-radiated structure. Hot oxidation figures are true corrosion figures composed of pits having walls parallel to planes (100) of Al. 11 ref. (R1h, M27; Al)

444-R.* (Japanese.) **Aluminum and Aluminum Alloys in the Wine and Brandy Industry. Pt. 2. Corrosion of Aluminum Alloys in Alcohol and Acid Solution.** Morinaga Takuichi, Zaima Shigeo and Kagami Motoo. *Light Metals,* no. 30, May 1958, p. 26-33.

Specimens are dipped in alcohol diluted nearly equal to the alcohol concentration of raw brandy (or wine) and corrosion resistance examined. Specimens are next dipped in acid solution equal to the total acidity of raw brandy (or wine) and examined. Experiment was repeated for a mixed solution of alcohol and acid. 8 ref. (R7f; Al)

445-R.* (Japanese.) **Oxidation of Titanium-Iron Alloys in Air at High Temperatures.** Morinaga Takuichi, Miura Ishi and Takaai Tetuya. *Light Metals,* no. 30, May 1958, p. 42-52.

Investigated by measuring the weight change due to formation of oxidation layers. Specimens were Kroll Ti, 1% Fe, 2% Fe, 4% Fe and 8% Fe alloys heated in air at 600, 700, 800 and 900° C. The parabolic rate law was applicable to the oxidation of Kroll Ti and Ti-Fe alloys in the range 600-900° C. Activation energies were calculated. (R1h, 2-62; Ti-b, *Fe*)

446-R.* **Theory and Practice of Boiler Water Treatment as a Means of Eliminating Corrosion and Scale.** E. Quaade-Holm. *Corrosion Technology,* v. 5, July 1958, p. 213-214, 237.

An organic compound of high molecular weight not only eliminates scale-forming compounds, but removes old scale. The scale is physically removed rather than chemically decomposed. (R4c, R10b)

447-R.* **Magnetic Treatment of Liquids for Scale and Corrosion Prevention.** Theo Vermeiren. *Corrosion Technology,* v. 5, July 1958, p. 215-219.

Use of permanent magnetic field through which the water supply passes inhibits corrosion by transforming ferric hydroxide into magnetite, and causes dissolved minerals to remain in solution rather than to be deposited as scale. (R10g)

448-R.* **Water Treatment for Domestic Hot-Water Supplies.** C. C. Hanson. *Corrosion Technology,* v. 5, July 1958, p. 220-224.

Process using sodium calcium hexametaphosphate to prevent scale and corrosion. 5 ref. (R10b)

449-R.* **Galvanic Corrosion.** J. Boraston. *Inspection Engineer,* v. 22, May-June 1958, p. 50-56.

Causes, prevention of dissimilar metal corrosion, crevice corrosion, stay current corrosion. 4 ref. (R1a)

450-R.* **The Effect of Surface Finish and Galvanic Coupling on the Corrosion Resistance of ASTM A-212 Carbon Steel in Primary and Secondary Water.** L. R. Scharfstein. *Bettis Technical Review,* WAPD-BT-7, Mar. 1958, p. 52-57.

Neither surface finish nor galvanic coupling has any appreciable effect on corrosion resistance of carbon steel under reactor operating conditions. (R4c; CN)

451-R.* **Corrosion of Shield Tank Materials in Lithium Chromate Solutions.** E. Rau and K. Jakobson. *Bettis Technical Review,* WAPD-BT-7, Mar. 1958, p. 58-65.

Corrosion of shield tank materials (carbon steel, copper and lead) investigated in an inhibiting solution of lithium chromate. Standard test coupons and some soldered couples were tested in lithium chromate solution (1630 ppm.) with different pH values. Results indicate that the solution is effective for at least six months. (R10a; Cu, Rb, ST)

452-R. **Copper Alloys for Corrosion Resistance.** R. V. L. Hall. *Chemical Engineering Progress,* v. 54, June 1958, p. 51-55.

Combination of Cu alloys with ferrous or other alloys as duplex tube or clad components has excellent corrosion-resistant properties. (R-general; Cu-b)

453-R. **Costly Liquid Chlorine Corrosion Overcome by Zirconium.** *Chemical Processing,* v. 21, July 1958, p. 108-109.

(R6q; Zr)

454-R.* **Thin Metal Film Corrosion Indicators.** David Roller. *Corrosion,* v. 14, June 1958, p. 263t-267t.

Evaluates effectiveness of thin continuous iron films vacuum deposited on borosilicate glass and Plexiglass 55 in thicknesses ranging from 100 to 2500 Å, as corrosion indicators by tests made in atmospheres varying from 0 to 100% relative humidity; change in electrical resistance and visual appearance with corrosion. 8 ref. (R11a, Fe, 14-62)

455-R. **Development of the Redox Probe Field Technique.** F. E. Constanzo and R. E. McVey. *Corrosion,* v. 14, June 1958, p. 268t-272t.

Field technique developed to obtain oxidation reduction potentials of soils through use of probe. Compares Redox data to other standard corrosion criteria. (R8)

456-R.* Corrosion Resistance of Five Stainless Alloys in Nitric Acid Containing Chloride. I. I. Tingley. *Corrosion,* v. 14, June 1958, p. 273t-274t.

A number of stainless steels and the new alloy Ni-O-nel were tested in solutions 8N in HNO_3 and 0.2N in chloride. Stainless steels type 304L, 316, 309SCb and 329 were all resistant to the liquid and hot vapor, only type 329 showed good resistance to the condensing vapors from these solutions. The resistance of this steel was about 1000 times as great as that of type 304L, 316 and 309SCb. (R6g; SS)

457-R.* Laboratory Testing of Railroad Diesel Cooling System Corrosion Inhibitors. J. I. Bregman and D. B. Boies. *Corrosion,* v. 14, June 1958, p. 275t-279t.

Results of flask type and recirculating tests with several commercial and experimental corrosion inhibitors; effect of coupling between various metals, inhibitor dosage level, water composition and antifreeze. (R4, R10b, R11h)

458-R.* Inhibition of Corrosion of Steel by Tetramethylammonium Bromide. Rudolph Macy, B. L. Harris, W. C. Bull and J. W. Eastes. *Corrosion,* v. 14, June 1958, p. 280t-282t.

Data on effectiveness of tetramethylammonium bromide and hexamine in inhibiting corrosion of steel by mustard, bis (2-chloroethyl) sulphide. Effect of inhibitor on rate of decomposition of mustard at 150° F. 11 ref. (R10f; ST)

459-R.* Inhibition of Titanium in Fuming Nitric Acid. J. B. Rittenhouse and C. A. Papp. *Corrosion,* v. 14, June 1958, p. 283t-284t.

Specimens of commerically pure Ti in Ti alloy containing 8% Mn were exposed to fuming nitric acid in tests at 30° C. of 28 days' duration in which a vapor space in the storage vessel contained varying amounts of oxygen. Results indicated no inhibition of titanium corrosion by oxygen but confirmed inhibiting effect of water at 1 to 2% by weight in fuming nitric acid. 4 ref. (R6g, R10b; Ti, *Mn,* O)

460-R.* Laboratory Studies Relating Mineral Quality of Water to Corrosion of Steel and Cast Iron. T. E. Larson and R. V. Skold. *Corrosion,* v. 14, June 1958, p. 285t-288t.

Influence of combination of various normal mineral constituents in domestic waters on rate of corrosion of cast iron and steel and on accumulation of corrosion products. Tests with air-saturated waters at room temperature with velocities of 0.1 to 1.0 ft. per sec. with pH control by CO_2 at 6.0 to 8.5. Ions considered include chloride, sulphate, bicarbonate and calcium. 6 ref. (R4, R11; CI, ST)

461-R. The Current-Voltage Relationship of Galvanic Anode Arrays in Cathodic Protection. L. J. Waldron and M. H. Peterson. *Corrosion,* v. 14, June 1958, p. 289t-294t.

Arrays of impressed current steel anodes of five different anode sizes and a steel sea wall acting as a cathode were used in investigating current outputs. Determined output current for driving potentials of 0.1, 0.2, 0.5, 0.7 and 1.0 volts between cathode and anode arrays. (R10d)

462-R.* Accelerated Condensation Corrosion Test for Evaluating Rust Preventives. E. A. Dieman and J. W. Gaynor. *Corrosion,* v. 14, June 1958, p. 302t-304t.

Apparatus and procedure employed in accelerated condensation corrosion test for evaluating effectiveness of rust preventives. Cooling to increase condensation on steel test panels and panel preparation procedure involving water treatment; decreased testing time and increased precision compared to results obtained in JAN-H-792 humidity cabinet tests. 5 ref. (R10b, R11k; ST)

467-R.* The Behavior of Steels in Hydrogen Sulfide Environments. L. W. Vollmer. *Corrosion,* v. 14, July 1958, p. 324t-328t.

Spontaneous cracking of steels in deep high-pressure condensate wells producing gas containing hydrogen sulphide. The susceptibility of most constructural steels to sulphide-stress cracking can be minimized, if not eliminated, by appropriate heat treatment which must include tempering at a temperature not less than 1150° F. and by limiting the maximum mechanical properties to predetermined levels. 11 ref. (R1d, R7k; ST)

468-R.* Surface Area Relationships in Polarization and Corrosion. Milton Stern. *Corrosion,* v. 14, July 1958, p. 329t-332t.

Polarization behavior of surfaces containing regions which exhibit different overvoltage parameters for the same reaction. The effect of cathode area fraction on corrosion potential and corrosion rate is considered for a corroding surface controlled by activation polarization. It is shown that the corrosion potential and corrosion rate are most sensitive to area changes when the surface is largely cathode or anode. 5 ref. (R1a)

469-R.* Cathodic Protection of Radiant Heating Pipes. L. C. Wasson. *Corrosion,* v. 14, July 1958, p. 333t-336t.

(R10d; 4-60)

470-R.* Service Performance of Cast Magnesium Alloy Anodes. G. L. Christie. *Corrosion,* v. 14, July 1958, p. 337t-340t.

Designs tested included sand cast cylindrical anodes with cast-in steel conductor rods, which corroded in a very uniform pattern, and chill cast rectangular anodes with cast-in retaining straps, which corroded preferentially at the cast-in straps. The Mg alloy used in all cases was AZ-63. Chemical analysis of the metal indicates that the only major difference in the two anodes is inverse segregation of the major alloying constituents in the chill cast anodes. (R10d; Mg-b, 17-52)

471-R.* Corrosion of Steel in Water by Varied Ratios of Dissolved Gases. J. Wade Watkins and G. W. Kincheloe. *Corrosion,* v. 14, July 1958, p. 341t-344t.

Tests were conducted with varied ratios of free carbon dioxide to both oxygen and hydrogen sulphide. Corrosion rate as a function of time in the system was determined at time intervals to a maximum of 984 hr. exposure. Corrosion caused by oxygen and free carbon dioxide increased almost in direct proportion to the concentration of dissolved oxygen. 5 ref. (R4, 2-66; ST)

472-R.* Mechanism of Inhibiting Effect of Hydrofluoric Acid in Fuming Nitric Acid on Liquid-Phase Corrosion of Aluminum and Steel Alloys. David M. Mason and John B. Rittenhouse. *Corrosion,* v. 14, July 1958, p. 345t-350t.

Inhibiting effect of hydrofluoric acid is found to be dependent primarily on the formation of a tenacious insoluble fluoride compound of Al or Fe, respectively, on the surface of the metal. This mechanism is discussed in relation to solubility data for several pertinent compounds; analysis of passivating coating on metal samples; correlation of solubility data with extent of corrosion of metal. 5 ref. (R6g, R10b; Al-b)

473-R.* The Corrosion Resistant Properties of Zirconium. Pt. 2. F. G. Cox. *Corrosion Prevention and Control,* v. 5, June 1958, p. 46-48.

Summarizes resistance of Zr to liquid Bi, Bi-In-Sn eutectic, Bi-Pb eutectic, Bi-Pb-In eutectic, Ga, Li, Hg and Na. Galvanic corrosion and corrosion by gases. 8 ref. (R1a, R6m; Zr, *Bi, In, Pb, Ga, Hg, Na*)

474-R. Atmospheric Corrosion of Metals at Low Temperatures. A. A. Dychko and K. A. Dychko. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 261-267. (Translation by Consultants Bureau, Inc.)

A critical temperature of —25° has been found, below which atmospheric corrosion of metals is sharply retarded. The probability of chemical action on metal surfaces is decreased, because the absolute humidity of atmospheric air decreases with fall of temperature; moisture is deposited from the air in the form of hoarfrost and snow, which are less corrosive than water toward metals; rapid, relative moist corrosion passes into slow, relatively dry corrosion; atmospheric air has a lower content of the components which have an active influence on metal corrosion. 9 ref. (R3, 2-63)

475-R. (Japanese.) **Blackening of Stainless Steel.** R. Higashiumi. *Metals,* June 1958, p. 434-436.

The formation of black films by chromic acid oxidizing, electrochemical oxidizing, sulphidization and low-temperature oxidizing. (R1h; SS)

476-R.* **Van de Graaff Study: Second Interim Report on the Deposition of Corrosion Products Under Irradiation.** G. P. Simon, B. G. Schultz and Y. Solomon. *Bettis Technical Review,* WAPD-BT-7, Mar. 1958, p. 43-51.

Van de Graaff studies to determine what variables are involved in the phenomenon of preferential deposition of crud on fuel element surfaces. Previous work indicates that irradiation at freshly formed corrosion products causes a marked increase in the amount of deposition. Additional work indicates that the release rate and the amount of deposition vary inversely with pH. (R2b, 2-17)

477-R.* **Watch Out for Stress Corrosion in Metals.** E. H. Phelps. *Product Engineering,* v. 29, Aug. 4, 1958, p. 56-58.

Stress in certain chemical environments leads to intergranular and transgranular corrosion. Design principles to avoid this corrosion. (R1d; 3-66)

478-R.* (French.) **High-Temperature Corrosion by Water of Very Pure Aluminum Crystals.** Jean Herenguel and Pierre Lelong. *Comptes Rendus,* v. 246, Apr. 28, 1958, p. 3481-3484.

Variable grain growth in Al monocrystals proceeds according to crystal orientation and is associated with speed of corrosion and appearance of pits. A homogeneous, compact film is formed, followed by pitting. In some areas pits do not form; instead, depressions similar to surface undulations of Zr are noted. (R4a; 2-62, Al)

479-R.* (French.) **Research on Dry Corrosion. Oxidation of Lead Pellets.** Haidun N. Terem. *Faculte des Sciences de l'Universite d'Istanbul, Revue,* v. 22, Oct. 1957, p. 343-352.

Tiny pellets can be heated above melting point of lead without changing shape. Prior to heating, specimens were cleaned and sized with emery paper and others were further cleaned in solution of nitric acid. Oxidation of Pb at any temperature obeys parabolic law. Minimum of oxidation indicated by Gruhl in zone of crystallographic transformation of lead oxide is confirmed. An induction period is observed at 535° C., which partially confirms parabolic results obtained by Weber and Baldwin. Granting that oxidation develops at different speeds under 475 and over 530°, corresponding activation energies approach 6900 and 23,000 cal. 13 ref. (R1h; Pb, 6-67)

480-R.* (French.) **Corrosion of Iron in General and of Concrete Reinforcement in Particular.** M. Berthier. *Revue de Materiaux,* no. 511, Apr. 1958, p. 101-105.

Corrosion viewed as risk to be dealt with before occurrence; theory of passivation of iron; passivation techniques, use of low-solubility salts such as phosphates and fluorides. 3 ref. (R10c; Fe)

481-R.* (French.) **Study of the Corrosion Resistance of Nodular Cast Iron.** Irina Cornea. *Revue de Métallurgie (Bucarest),* v. 1, 1956, p. 63-71.

Resistance to corrosion by hydrochloric acid of nodular cast iron is nearly twice as great as that of gray cast iron of similar composition and microstructure. This supports hypothesis that nodular cast iron in oxygen-free acid mediums should have better resistance than gray cast iron because of the smaller ratio of cathodic to anodic areas of nodular cast iron as compared with gray cast iron, the corrosion rate, in the presence of hydrogen depolarization, being determined by the ratio of cathodic to anodic areas. 4 ref. (R1, R6g; CI-r)

482-R.* (Russian.) **New Acid Resistant Nodular Iron.** Z. B. Shapiro. *Liteinoe Proizvodstvo,* no. 5, May 1958, p. 24-26.

Development of corrosion resistant iron with 3% C, 3% Si, 1% Mn, 2.2% Cr, 17.5% Ni and 8.5% Cu for use in automobile motor cylinder block. (R6g, T21b; CI-r)

483-R. Cavitation Resistance of Electrodeposited Chromium. M. G. Timerbulatov and V. E. Khromov. *Vestnik Mashinostroeniya,* v. 38, no. 2, 1958, p. 56-58. (Henry Brutcher, Altadena, Calif., Translation no. 4212.)

Index of cavitation resistance is loss of weight of specimens exposed to vibration with a magnetostrictional vibrator in a liquid. Setup for plating the specimens, correlation between cavitation resistance and Vickers hardness of Cr plates. Factors involved in cavitation resistance such as type of plate (dull vs. bright); thickness, porosity, brittleness and residual stress state of plate; hardness of basis metal. Cavitation resistance is improved by Cr deposits. (R2m, Q29c; *Cr,* 8-62)

484-R.* Action of Alternating Current on Corrosion Process of Iron. Yutaka Torigoe. *Electrochemical Society of Japan, Journal,* v. 28, 1958, p. E-30-E-33.

The effect of alternating current on the local cells on iron in a given corrosive environment is determined by the impressed potential, the polarization characteristics of the local anode and cathode and the magnitude of alternating current applied. (R1j; Fe)

485-R. Corrosion and Water Treatment. G. G. Sindery. *Corrosion Technology,* v. 5, July 1958, p. 209-212, 224.

Water treated for a specific industrial use may or may not be satisfactory from a corrosion standpoint. If not, it must be treated appropriately. (R4a, R10b)

486-R. The Formation of Crystalline Anodic Oxide Films on Beryllium. M. L. Levin. *Faraday Society, Transactions,* v. 54, June 1958, p. 935-940.

In 1 and 10% aqueous solutions of nitric acid and in a nitric + chromic acid solution the anodic films on electropolished polycrystalline Be are found to be always crystalline. In ammoniacal ethylene glycol, a nonaqueous electrolyte, the anodic film is amorphous. 15 ref. (R1h; Be)

498-R. (German.) **Behavior of Cast Iron in Acids With and Without Inhibitors.** Willibald Machu and M. G. Fouad. *Werkstoffe und Korrosion,* v. 9, June 1958, p. 369-379.

In acids and their mixtures, effect of inhibitors is independent of the nature of their charge. Losses of weight caused by mixtures are not equal to the algebraic mean of those of the individual acids, owing to modification of hydrogen ions and anions. Organic and inorganic inhibitors behave alike. Phosphate ions of phosphoric acid act as inhibitors. Carbides and silicides in the surface of the cast iron reduce inhibition. Structure of inhibitor film as well as solubility and resistance of surface film determine degree of inhibition. 7 ref.

520-R.* Underground Corrosion. Pt. 1. Corrosion Mechanism of Metals in Soil. *Corrosion Technology,* v. 5, Jan. 1958, p. 5-9.

Bureau of Standards report on corrosion mechanism of metals in soil free of stray currents. Graphitization may decrease or accelerate the normal rate of corrosion; physical or chemical properties of the soil control the character of corrosion; pitting factors are roughly proportional to the ratio of the uncorroded areas. In well-aerated soils the rate of pitting, although initially great, falls off rapidly with time, whereas, in poorly-aerated soils, the initial rate scarcely falls off with time. Low-alloy steels have a greater pitting rate than the plain steel; however, as the exposure increases, the rate

of pitting of the alloy steels diminishes more rapidly than the plain steel. High-alloy steels, especially Cr and Ni, decrease the weight loss through the entire range. (R8)

521-R.* Corrosion of Iron in Hydrochloric Acid in the Presence of Inhibitors at Various Temperatures. Pt. 1. I. P. Anoshchenko. *Journal of Applied Chemistry of the USSR,* v. 30, Mar. 1957, p. 417-422.

Polarization curve method used to study effects of potassium bromide, urotropine, acridine and combinations of them, on electrode processes in the corrosion of iron in 6 N hydrochloric acid solution at various temperatures (20, 40, 60 and 80°). At elevated temperatures urotropine has a considerably stronger retarding effect on the cathodic reaction of solution of iron in the acid. (R6g, R10b; Fe)

522-R.* Corrosion of Iron in Hydrochloric Acid in the Presence of Inhibitors at Various Temperatures. Pt. 2. I. P. Anoshchenko. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 557-561.

Depolarization in pure 6 N hydrochloric acid solution at 20° is effected by more than 95% by discharge of hydrogen ions. The solution rate of iron in pure acid rises with the temperature in geometrical progression. Participation of oxygen in depolarization increases with increasing inhibiting action of additives has been confirmed. The greatest inhibiting effect at 80° is produced by a combination of urotropine, ecridine, potassium bromide and methyl alcohol. The corrosion rate of iron in acid increases exponentially with the reciprocal of the temperature. (R6g, R10b; Fe)

Corrosion rates of sheets of Al alloys containing Fe, Cu and silica immersed in 0.2 to 0.6 normal sodium hydroxide at 32 to 60° C. for periods of 1 to 5 hr. Inhibitor efficiencies of agar-agar, gum acaciae, dextrin, glue or gelatin at concentrations of 2 to 20 g. per l. Agar-agar or gum acaciae at 10 g. per l. gave inhibitor efficiencies in the range of 80 to 90. 9 ref. (R10b, R6j, Al, *Cu, Fe, Si*)

532-R.* Platinum-Faced Titanium for Electrochemical Anodes. J. B. Cotton. *Platinum Metals Review,* v. 2, no. 2, Apr. 1958, p. 45-47.

Titanium is resistant to the passage of current into an electrolyte, but has low resistivity when a second metal makes contact with it. When Ti is used as an anode in salt water and an anodic current increased, the voltage required to force the current through the service film rises until, at the weakest point, the film breaks down and local corrosion ensues. If, however, a small piece of Pt foil or wire is spot welded to the Ti, most of the current passes out through the Pt and the Ti is uncorroded. (R10d; Ti, Pt)

533-R. Effect of Porosity on the Corrosion Rate of Anodic Coatings. L. I. Kadaner and A. Kh. Masik. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 839-842. (Translation by Consultants Bureau, Inc.)

The rate of corrosion of anodic coatings in electrolytes depends to a significant extent on their porosity. Increase of the thickness of an anodic coating leads, on one hand, to an increase of the corrosion rate owing to increasing physical heterogeneity, and on the other, to a decrease of the corrosion rate owing to decreased porosity of the coating. The effect of layer thickness on the corrosion rate is determined by the relative significance of these factors. 5 ref. (R-general, 8-78, 9-68)

541-R. Corrosion Cracking of Brass Under the Action of a Cyanide Electrolyte. A. V. Shreider. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 836-838. (Translation by Consultants Bureau, Inc.)

Corrosion cracking of brass manifolds used for conveying liquid fuel. (R1d, R6j; Cu-n)

542-R. (Czech.) **Corrosion of Silver Articles.** Karel Komarek. *Casopis Narodniho Musea,* no. 2, 1955, p. 136-141.

Physico-chemical properties of Ag and causes of its corrosion in air and in the soil, are considered. In the air Ag reacts with H_2S, in the presence of oxygen, to form Ag_2S. Corrosion of Ag in the soil consists in the formation, on its surface, of a film of AgCl by interaction with solutions of NaCl in the presence of CO_2 and O_2. Formation of AgCl in the soil is promoted by soluble salts of Fe^2 ions. The coating of Ag_2S is removed from the surface of the Ag with KCN by converting Ag_2S to the soluble complex salt $KAg(CN)_2$. (R3, R8; Ag)

543-R. (Russian.) **Corrosion Resistance of Aluminum and Copper.** V. I. Avdeyeva, L. P. Povalyayeva and A. Ya. Shatalov. *Trudy Voronezhskogo Gosudarstvennogo Universitela,* no. 2, 1956, p. 79-80.

Rate of corrosion of pure Cu and Al in buffer solutions in the presence of 0-1.0 *N* Cl-ions, encompassing the pH range of 2-12. Cu showed minimum rate of corrosion at pH 10-11.0, depending upon Cl-ions; minimal rate of corrosion of Al was at a pH 7.0-7.5 irrespective of the Cl-ion content of the solution. (R4; Al-a, Cu-a)

544-R.* **Vapor Phase Corrosion Inhibitors. Pt. 2. Applications.** K. S. Rajagopalan. *Electrochemical Society, India Section, Bulletin,* v. 7, Apr. 1958, p. 37-43.

Mechanism of operation of vapor phase corrosion inhibitors; examples of applications in packaging. 17 ref. (R10b)

545-R. (Russian.) **Effect of Chromium and Antimony on the Corrosion of Wrought Iron.** I. M. Bokhovkin. *Trudy Arkhangilskovo Lesotekhnicheskovo Instituta,* v. 16, 1955, p. 56-62.

Corrosion of graphitized wrought iron alloyed with Cr and Sb in 1 *N* H_2SO_4 at 50° is greater than non-graphitized specimens. Maximum attack was observed by in iron containing 0.42% Sb, and is explained by the chemical reaction between Cr and Sb. In the absence of passivation the rate of corrosion is determined by the interatomic bonds in alloys.
(R6g, 2-60; Fe-m, *Cr, Sb*)

546-R.* **The Use of Magnesium for the External Cathodic Protection of Marine Vessels.** C. F. Schrieber. *Corrosion,* v. 14, Mar. 1958, p. 26-30.

Over-all hull, including stern area, may be protected by a distributed system of Mg anodes. Anode weight, optimum length and number of anode strings are related to anode life. Cost of cathodic protection on ships and maintenance cost for unprotected ships compared. 7 ref. (R4b, R10d; Mg)

547-R.* **Prevention of Localized Corrosion in Sulfuric Acid Handling Equipment.** G. A. Nelson. *Corrosion,* v. 14, Mar. 1958, p. 45-49.

Localized corrosion, usually deep grooves, is due to differences in carbide structure created during welding or hot riveting operations. Preventive measures include removing the objectionable zones by a normalizing heat treatment, preventing objectionable phases from forming, or covering the areas with other corrosion resistant materials.
(R6g, R10, T29m)

548-R.* **Stress Corrosion of Austenitic Stainless Steel in Geothermal Steam.** T. Marshall. *Corrosion,* v. 14, Mar. 1958, p. 59-62.

Geothermal steam contaminated with chlorides, hydrogen sulfide and carbon dioxide was used. Stress-corrosion cracking occurred readily in the aerated, superheated steam but not when air-free. Tests prove that the cathodic depolarizing action of oxygen is essential to the stress-corrosion mechanism. Five conditions must be satisfied simultaneously to have cracking of austenitic stainless steel by geothermal steam; therefore, failure to satisfy any one of these conditions will prevent attack. 20 ref.
(R4d, R1d; SS-e)

549-R.* (Czech.) **Oxidation of Fe-Al-C Alloys.** Miloslav Vkylicky, Bohumil Prenosil and Hanus Tuma. *Hutnicke Listy,* v. 13, 1958, p. 490-495.

Study of alloys with varying Al and C content in the range of 900 to 1050° C. In some alloys oxidation is characterized by formation of blisters resulting from warping of initial protective layer. Oxidation continued at greater rate on spot of blister formation. Metallographic examination indicated that warping of initial protective layer is caused by volume changes connected with transformation of epsilon phase to gamma phase. This transformation was conditioned during oxidation by reduction of Al content in the base material in proximity to the surface. 16 ref. (R1h; Fe, Al, C)

550-R. (Russian.) **Kinetics of Etching of Zinc Used in Printing by the Chemical Method.** A. N. Krestovnikov and S. S. Gastev. *Nauchneye Trudy Moskovskoe Poligraficheskogo Instituta,* no. 3, 1955, p. 135-142.

Rate of dissolution of sheet Zn used in the printing industry, in mixtures of HCl and HNO_3 (using 15, 10 and 5% by weight of each component in the mixture), by determination of loss in weight after 5 min. of etching. (R7b; Zn, 4-53)

551-R.* Corrosion and Protection of Galvanized Steel Transmission Tower Footings. J. D. Piper. *Corrosion,* v. 14, Mar. 1958, p. 19-25.

Although the potentials vary with the seasons, the condition of galvanized tower footings may be predicted by means of electrical potential measurements. While corrosion occurs near the water table on towers having footings in permanent moisture, serious corrosion occurred only on footings having a metallic connection to electropositive structures or having a direct contact with cinders and other coal products. Magnesium anodes provide protection for galvanized tower footings. 5 ref.

552-R.* A Reaction Rate Study of the Corrosion of Low-Hafnium Zirconium in Aqueous Hydrofluoric Acid Solutions. Tennyson Smith and George Richard Hill. *Electrochemical Society, Journal,* v. 105, Mar. 1958, p. 117-121.

Zirconium dissolves readily in HF solutions leaving a smooth unpitted surface. The rate of dissolution is directly proportional to the ununionized HF concentration when studied over a temperature range of −78° C. using a radioactive tracer Zr^{95}. 9 ref. (R6g; Zr-b)

553-R.* Dissolution of Metals in Aqueous Acid Solutions. Pt. 2. Depolarized Dissolution of Mild Steel. A. C. Makrides and N. Hackerman. *Electrochemical Society, Journal,* v. 105, Mar. 1958, p. 156-162.

Dissolution rates of mild steel cylinders rotated in 2*N* HCL solutions containing ferric chloride, benzoquinone, and tolu-p-quinone. Dependence of rate on depolarizer concentration, stirring velocity, temperature and surface roughness of the metal. At high velocities the dissolution rate depends linearly on velocity of rotation and on the roughness of the metal surface. 22 ref. (R6g; CN)

554-R.* (French.) **Contribution to the Study of the Corrosion Mechanism of Magnesium and One of Its Alloys.** Guy Gronoel. *Comptes Rendus,* v. 246, May 12, 1958, p. 2750-2753.

Study of pH-potential curves of electrodes of high-purity Mg and of Ga_3Zr immersed in solutions of hydrochloric acid. Tests were conducted to determine effect of initial concentration of solutions at temperatures ranging from 20 to 50° C., both in presence of air and in nitrogen atmosphere. Comparative measurements were made in absence of agitation and after violent agitation of solutions, particularly in area contiguous to electrode. Films formed were studied by micrographic and radiocrystallographic means. (R6g, 2-66; Mg)

555-R. Effect of Cathodic and Anodic Polarization on the Rate of Corrosion Cracking in Stainless Steel. V. V. Romanov and V. V. Dobrolyubov. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 19-21. (Henry Brutcher, Altadena, Calif., Translation no. 4277.)

Cathodic polarization retards and can fully stop corrosion cracking. Anodic polarization, on the other hand, speeds the process. Polarization has an effect on the character of corrosion cracks, on their shape and form of development. Increase in temperature raises the strength of the protective cathodic current, while the acceleration of the influence of anodic polarization was attained under much lower temperatures. 7 ref. (R1d, 2-61; SS)

556-R. Selective Oxidation Due to the Heating of the Evaporated Film of Alpha-Brass. N. Takahashi and K. Mihama. *Electron Microscopy, Proceedings of the Stockholm Conference,* Sept. 1956, p. 322-324.

A single crystal of alpha-brass is subjected to oxidation. Formation, crystal structure of CuO and ZnO studied. 8 ref.

567-R. (Russian.) **Some Data Concerning the Resistance to Intercrystalline Corrosion of Pure-Austenite Steels Containing 23% Chromium and 23-28% Nickel.** Yu. I. Kazennov and L. P. Kolosova. *Avtomaticheskaya Svarka,* no. 2, 1957, p. 11-21.

Effects of heating, during welding, on resistance to intercrystalline corrosion of steels containing 0.06-0.09% C. (R2h, K9n; SS, 7-51)

568-R. (Russian.) **Corrosion of Cylinders of Automotive Engines.** B. B. Genbom. *Avtomobil'naya i Traktornaya Promyshlennost,* no. 5, 1956, p. 18-23.

Cylinder corrosion is essentially of electrochemical nature. One of the principal causes of uneven wear of the cylinders is the uneven temperature distribution over their inner surface. The rate of wear of any given area increases with lowering of its temperature during operation. (R1a, Q9n, T21b)

569-R. (Russian.) **Protective Potentials of Metals.** V. V. Gerasimov. *Izvestiya Akademii Nauk SSR, Otdelenie Khimicheskikh Nauk,* no. 3, 1957, p. 263-269.

Method of calculating protective potentials is based on the assumption of the existence of an exponential correlation between rate of corrosion of the metal and its potential (on the condition that ionization of the metal constitutes the controlling stage of the process). (R1a)

570-R. (Russian.) **Corrosion Resistance of Aluminum and Copper.** V. I. Avdeyeva, L. P. Povalyayeva and A. Ya. Shatalov. *Trudy Voronezhskogo Universiteta,* no. 2, 1956, p. 79-80.

Rate of corrosion of pure Cu and Al in buffer solutions in the presence of different additions of 0-1.0 *N* Cl ions, encompassing the pH range of 2-12. Cu showed minimum corrosion rate at pH 10-11.0, depending upon Cl ions; minimum rate for Al was at pH 7.0-7.5 irrespective of the Cl ion content of the solution. (R6; Al, Cu)

571-R. (Russian.) **Investigation of Corrosion Resistance of Solid Solutions of Metals. Pt. 1. The System In-Pb.** N. N. Gratsianskiy and M. L. Kaplan. *Zhurnal Fizika Khimii,* no. 3, 1956, p. 651-659.

Rate of corrosion, steady-state potential and microhardness of solid solutions of the In-Pb system in the range 0-100 at. %. Corrosive media used: 1% H_2SO_4 1% citric acid at 16 and 50° C.
(R6g; In, Pb, 14-67)

572-R. An Investigation of Intergranular Oxidation in Stainless Steels and High-Nickel Alloys. C. A. Siebert, M. N. Sinnott, L. H. DeSmyter and R. E. Keith. University of Michigan. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131471, June 1955, 108 p. $2.75.

Grain-boundary oxidation of chromel alloys ASM, ARM and D, and Type 310 stainless steels in the range of 1600 to 2000° F. These alloys and Inconel were oxidized for 100-hr. periods in the stressed condition and up to 500 hr. in the unstressed condition; intergranular measurements were obtained microscopically. Stress caused an increase in intergranular penetration when a minimum stress was reached. In general, the intergranular penetration increased with increasing time and temperature. A plot of the square of the specific weight gain vs. temperature resulted in a straight-line relationship. (R1h, R2h; SS, Ni)

573-R. (Russian.) **Corrosion Characteristics of Welded Seams of Stainless Steels in Oxidizing Solutions.** B. I. Medobar, N. A. Langer and M. M. Kurtepov. *Avtomaticheskaya Svarka,* no. 2, 1957, p. 57-60.

Tests in boiling 15% HNO_3 (I), 55% HNO_3 (II) and 15% solution of HNO_3 + 10% $K_2Cr_2O_7$ (III), have shown that in I all the seams tested are stable, in II the rate of corrosion is 100-200 times higher. In III a sharp acceleration in corrosion takes place. (R6g; SS, 7-51)

574-R. (Russian.) **Passivity of Steel in Nitrose.** Ye. I. Litvinova. *Zhurnal Prikladnoi Khimii,* no. 10, 1956, p. 1521-1529.

Study of passivation of steel in hot nitrose acid containing 1-10% HNO_3 and 75-76% H_2SO_4. The steel undergoes strong corrosion with extensive evolution of gas, but as a result of passivation this process suddenly ceases. The greater the initial rate of corrosion, the shorter

is the time until passivation results. At optimal passivation temperature of 100° a protective layer is formed about 3 microns thick, consisting of $Fe_2(SO_4)_3$. (R10c, R6g; ST)

575-R. **HRP Radiation Corrosion Studies: In-Pile Loop L-4-11.** J. R. McWherter and J. E. Baker. *U. S. Atomic Energy Commission, ORNL-2152,* 1958, 48 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Corrosion studies of Zr and Ti alloys and stainless steels, as well as specimens of synthetic sapphire, sintered alumina, Pt and Incoloy. Zr alloys Zr-3 (3% Ag), Zr-3 (0.52% Sn, 5.71% Ti, 40 ppm. N_2), Zr-3 (0.52% Sn, 0.28% Fe, 5.66% Ti, 60 ppm. N_2), Zr-3 (1.4% Fe) and Zr-4 (0.7% Fe, 2.8% Cr) corroded at rates about two or three times those observed for Zircaloy-2 at the same power density. Corrosion rates for Incoloy were found to be about the same as those for stainless steel exposed to similar conditions. (R-general, T11; Zr-b)

576-R. (Czech.) **Corrosion of Silver Articles.** Karel Komarek. *Casopis Narodniho Musea, Oddeleni Prirodoved,* v. 124, no. 2, 1955, p. 136-141.

Physico-chemical properties of Ag and causes of its corrosion in air and in the soil. (R-general; Ag)

577-R. (Russian.) **Corrosion of Steel in the System Nitric Acid-Acetic Acid.** A. V. Titov. *Trudy Ivanovskogo Khimiko-Tekhnologi-Cheskogo Instituta,* no. 5, 1956, p. 80-81.

Maximum rate of corrosion is observed in the pure acids, and a minimum rate in a mixture of acids containing 42% by volume of HNO_3. (R6g; ST)

578-R. (Russian.) **Supplementary Uses of a Type of Special Cast Iron.** *Tyshko. Prace Instytut Odlewn,* v. 6, no. 1-2, 1956, p. 10-21.

Cast iron with 5-8% Si is noted for its heat resistance. At around 900° it withstands oxidation well, but has significantly lower resistance to alkalies and salts. Addition of small amounts of Mo (2-4%) improves resistance to HCl and related chemical products. Aluminum cast iron is comparatively cheap and naturally suitable for production of lightly loaded articles working at high temperatures. High Cr cast iron also possesses good wear resisting qualities and is used for mill-roll facers, for the production of brakeblocks and parts of pumps. (R1h, R6, Q9n, 17-57; CI-q)

579-R. (German.) **Investigation of Thermoelectric Wear of Hard Metal Turning Tools and Its Elimination by Electrical Compensation.** Theodor Hehenkamp. *Archiv für das Eisenhüttenwesen,* v. 29, Apr. 1958, p. 249-256.

Thermoelectric currents resulting from contact at different temperatures between tool and production part cause wear by transfer of matter. 17 ref. (R2a, Q9, G17a, T6n; Ti, Ta, W, 6-69)

580-R.* (English.) **Strain Electrometry, Corrosion and Catalysis.** A. G. Funk, D. N. Chakravarty, H. Eyring and C. J. Christensen. *Zeitschrift fur Physikalische Chemie,* v. 15, no. 1-6, Apr. 1958, p. 64-74.

Effects of pH, ferrous ion concentration, oxygen and inert gases such as hydrogen and argon, as well as polarization effects, on the initial voltages and on the transients induced by straining on iron wire immersed in solution. Results are explained in terms of known catalytic and corrosive processes occurring at the electrode. Strain electrometry provides a valuable and relatively new approach to the problems of corrosion and catalysis. 15 ref. (R11a, R10c, P13c; Fe)

581-R.* (German.) **Effect of Trace Elements in Oxidizable Molten Metal and the Kinetics of Increased Concentration at Melt Surfaces.** Friedrich Erdmann-Jesnitzer and Hansfriedrich Hadamovsky. *Freiberger Forschungshefte,* no. B28, 1958, p. 32-35.

Oxidation stability of principal metal is enhanced whenever concentration of trace elements is increased at surfaces of the melt. Enrichment of all trace elements (excluding inert ones) at the surface is a general phenomenon, characterized by diffusion to outer melt surfaces and through the oxide lattice. It is due to primary oxidation of trace elements, their preferred diffusibility through the oxide lattice and dependent upon small atoms or ion size of trace element as well as low solubility in principal metal. Favorable oxidation stability of molten metal can thus be predicted. 5 ref. (R1h, N14; Pb, Zn, Cd, Al, Bi)

582-R. (Hungarian.) **Effect of Titanium and Boron on the Corrosion Resistance of High-Purity Aluminum.** H. M. Gyenlesne. *Magyar Tudomanyos Akademia Muszaki Tudomanyok Osstalyanak Kozlemenye,* v. 12, no. 1-4, 1954, p. 365-376.

Grain-refining additions of Ti and B do not reduce the corrosion resistance of Al. Up to 0.6% Ti does not lower corrosion resistance; boron somewhat accelerates the dissolution of Al in sulphuric and hydrochloric acids, but the effects of B in technical Al is very small, since the main element which lowers corrosion resistance is Fe. No correlations can be deduced about the effect of these additions on resistance to corrosion by the atmosphere or by weakly corrosive media, but the effects are small.
(R3, R6, 2-60; Al-a, *Ti, B*)

583-R.* (Italian.) **Use of Aluminum in Contact With Other Metals.** A. Prati. *Ingegneria Meccanica,* v. 6, July 1957, p. 9-16.

Galvanic corrosion; galvanic behavior of Al. Review of recent studies of corrosion of Al in bimetallic couples; conclusions and recommended conditions for use of Al in contact with other metals. 6 ref. (R1a; Al, 17-57)

584-R. Study of the Process of the High-Temperature Oxidation of Metallic Titanium in Water Vapor. G. P. Luchkin and G. G. Il'in. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 521-523. (Henry Brutcher, Altadena, Calif., Translation no. 3830.)

Oxidizability of Ti is higher in water vapor than in air. X-ray diffraction study shows that only the TiO_2 phase enters into the composition of the scale. Other phases (Ti_2O_3 and TiO) have not been detected by X-ray diffraction. The size of the grain of the scale diminishes monotonically from the outside portion to the surface of the metal. The greater oxidizability of Ti in water vapor is connected with the facilitated diffusion of O_2 through the layer of scale, which in turn is caused by its structural features. (R1h, 2-62; Ti)

585-R. (Russian.) **Problem of Oxidation of Molybdenum in the Temperature Range Above the Melting Point of MoO_3.** V. I. Arkharov and Yu. Kozmanov. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 566.

Speed of oxidation of Mo in air was measured at 900 to 1300° C., i.e., above the melting temperature of MoO_3 (793° C.). Speed was measured from the gain in weight of the specimen per unit surface area after 20 min. oxidation. Speed remains almost constant over a wide temperature range. Speed of oxidation depends substantially on the partial pressure of O_2. At 900° C. only MoO_3 can be detected by X-ray diffraction, and at 1100 to 1300° C. the specimens become covered with a thin film of MoO_2. Possible mechanism of the oxidation of Mo above the melting point of MoO_3. (R1h, 2-62; Mo)

586-R. Effect of Metals on Lubricants. Pt. 2. Corrosion and Oxidation Stability at 400° F. J. B. Christian. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131710, Feb. 1958, 35 p. $1.

Effects which metals and alloys used in various aircraft systems, and the fluids and lubricants employed in these systems, have on one another. The fluids were blended with various additives which improve their viscosity-temperature properties and retard oxidation. Corrosion and oxidation stability of a diester blend, a siloxane, and a silicate in the presence of various metal specimens. Lead was the only metal attacked by all fluids tested. It was also the only metal which caused significantly noticeable changes in the fluids.
(R7e; Pb)

587-R. Development of an Improved Corrosion Inhibitor for Water-Alcohol Solutions. D. B. Conklin, B. G. Peacock and J. E. Cole. Wyandotte Chemicals Corp. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131781, July 1956, 82 p. $2.25.

For use with alcohol-water injection fluid for aircraft engines. It inhibits corrosion of steel, stainless steel and Al alloys, is soluble in methanol, ethanol, water or mixtures of the liquids, and lowers surface tension of the mixtures. Although the inhibitor is chemically compatible with hard water solutions, inhibition efficiency is in-

versely proportional to water hardness. The inhibitor is a mixture of dicyclohexyl-ammonium nitrate, urea and 1-nitropropane in an anhydrous methanol solution.
(R10b, R7f; ST, SS, Al)

588-R. (Russian.) **Composition of Rust Developing on Iron in Contact With Water and Air.** I. V. Krotov. *Zhurnal Fizicheskoi Khimii*, v. 30, no. 8, 1956, p. 1696-1701.

The composition of old rust produced by Fe powder previously wetted with distilled water ground in a whirling grinder and rusting in air was studied by chemico-analytical and thermographic methods. Rust consists of gamma FeOOH, which loses the absorbed water when heated to 149° C. Gamma FeOOH transforms into gamma Fe_2O_3 at a further temperature rise. The process discontinues at about 290° C. The process of transition from gamma Fe_2O_3 into alpha Fe_2O_3 ends at about 676° C.
(R3, R4; Fe)

589-R.* **Corrosion Rate of Wrought Iron.** *Product Engineering (Design Digest)*, v. 29, Sept. 1958, p. B5.

Improved wrought iron shows 20-25% better resistance to corrosion from industrial atmosphere, acid and salt water.
(R3, R4b, R6; Fe-m)

590-R.* **High Alloys to Combat Corrosion.** Edward D. Weisert. *Product Engineering (Design Digest)*, v. 29, Sept. 1958, p. B16-B17.

Composition, corrosion resistance of Ni-Mo, Ni-Mo-Cr, Ni-Cr-Fe-Mo, Co-Cr-W-Ni, Co-Cr-W-C, Fe-Si, Fe-Si-Mo, Ni-Si alloys.
(R-general; Ni-b, Co-b, SGA-g)

591-R.* **Corrosion Properties of Titanium, Zirconium, Tantalum and Type 316 Stainless Steel.** *Welding Engineer*, v. 43, Sept. 1958, p. 41-43.

Resistance in a wide range of acids, bases, and salts at room and elevated temperatures.
(R6, R7, 2-62; Ti, Zr, Ta, SS)

592-R.* (German.) **Comparison Between Results of Exposure Tests in Industrial Air and Accelerated Corrosion Tests in Sulfur Dioxide Atmospheres.** A. Kutzelnigg. *Werkstoffe und Korrosion*, v. 9, July 1958, p. 429-434.

Roll of sulphur dioxide in corrosion reactions; Trestor apparatus for accelerated sulphur dioxide corrosion tests; uniformity of results achieved in apparatus. Dependence of water vapor condensation on time. Results of exposure tests in industrial atmosphere and accelerated tests show good agreement for Ni deposits, Zn-rich paints and varnish systems. 20 ref.
(R3, R11q; Ni, NM-g)

593-R.* (German.) **Comparing Exposure Tests on the Corrosion Resistance of Passivated Galvanized Steel.** T. Biestek. *Werkstoffe und Korrosion*, v. 9, July 1958, p. 434-439.

Results of three-year exposure tests on galvanic Zn coatings passivated by 15 different chemical methods. Test atmospheres were industrial, urban, rural and marine. Considerable variation in corrosion resistance was observed with use of different acid and chromate solutions for passivating. Comparison of exposure and accelerated tests. 10 ref. (R3, R10c; ST, *Zn*, 8-65)

594-R.* (German.) **Corrosion of Steel Pipes in Refinery Equipment by Sulphur-Rich Crude Oil.** P. Csokan. *Werkstoffe und Korrosion*, v. 9, July 1958, p. 443-450.

Corrosion and its thermal decomposition products. Chemical analysis and X-ray investigation of corrosion products. Corrosion mechanisms. 22 ref.
(R7a; ST, 4-60)

595-R.* **Mechanism of Oxide Film Formation on Zirconium.** O. Flint and J. H. O. Varley. *Physics and Chemistry of Solids, Journal*, v. 6, Aug. 1958, p. 213-222.

Surface condition of Zr controls both thermal and anodic oxidation. Effect of ultraviolet light. The interpretation suggested for these observations is in terms of the possible variation in electronic work function and defect state of the oxide depending upon the physical condition of the metal surface. These variations will affect the efficiency of anodic film formation, and a qualitative scheme of possible mechanisms whereby film growth is controlled is described. 11 ref.
(R2r; Zr)

596-R. **Thin Metal Films as Corrosion Indicators.** R. B. Belser and F. E. Hankinson. Georgia Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131894, May 1958, 98 p. $2.25.

Need for a sensitive, easily inspected, economical corrosion indicator which would integrate, with respect to time, the total exposure of packaged material to corrosive conditions. Corrosion properties and rates of Fe and Mn films and of the bimetal pairs Fe-Cu and Fe-Au. Important role in metal film corrosion of the adsorbed gas layer normally present on glass substrates. This layer furnished oxygen necessary for small particles of the oxides of iron to form at random sites on the film. These subsequently became elements of electrolytic cells, and destructive oxidation of the film proceeded by electrochemical processes.
(R11a, R2r, R10e; Fe, Mn, Cu, Au)

597-R.* (English.) **Effect of Temperature on the Electrode Potential Behavior of Titanium and Its Bearing on the Mode of Oxidation of the Metal.** E. M. Khairy and M. M. El Khatib. *Egyptian Journal of Chemistry,* v. 1, no. 1, 1958, p. 57-63.

Potential-temperature curves obtained from spectrographically pure Ti electrodes in air show a maximum and a minimum for the potential within the range 25-60° C. Curves from Sb plated electrodes reach the maximum and minimum values between 30 and 50° C. By exposing the electrodes alternately to hydrogen and high vacuum, their potential is activated and varies linearly from 25 to 50° C., having the temperature coefficient −6.4 mv. per °C. (R1h, P15; Ti)

601-R. Selecting Materials to Avoid Cavitation Damage. William J. Rheingans. *Materials in Design Engineering,* v. 48, Sept. 1958, p. 102-106.

Various types of stainless steel and aluminum bronze provide the best resistance to cavitation erosion in hydraulic equipment. There is a wide variation in the resistance of similar materials, and a small change in a material's chemical content or properties can substantially affect its resistance to cavitation damage. (R2m; SS, Cu-s, *Al*)

602-R. (German.) **Electrolytic Passivation of Silver With the "Argalin" Process.** H. W. Dettner. *Metalloberfläche,* v. 12, July 1958, p. 197-199.

New method of producing a transparent, durable passivated layer on Ag surfaces. (R10c; Ag)

603-R. (German.) **Electrochemical Behavior of Bimetallic Electrodes and the Application of Their Overpotential Curves in Corrosion Research.** G. Bianchi and G Caprioglio. *Werkstoffe und Korrosion,* v. 9, July 1958, p. 440-443.

The dependency of polarization voltage of a two-phase electrode upon situation and size of local cell surfaces, anodic and cathodic processes on local electrodes, direction and density of external current and the position of reference electrode are utilized for investigation of current density-voltage curves of electrodes which are corroded by local currents. 6 ref. (R1a, R11)

604-R.* Effect of Impurities Upon the Resistance of Magnesium Casting Alloys AZ92 and AZ63 to Corrosion. B. J. Nelson. *Modern Castings,* v. 34, Oct. 1958, p. 78-86.

Accelerated tests in NaCl-H_2O_2 by alternate immersion and in 3½% NaCl spray; various atmospheric exposures. (R3, R6, R11g, R11j; Al)

605-R. The Corrosion of Zircaloy-Base Fuel Alloys in High-Temperature Water. Stanley Kass. Westinghouse Electric Corp., Bettis Plant, Pittsburgh. *U. S. Atomic Energy Commission WAPD-TM-123,* Jan. 1958, 23 p.

Corrosion of Zircaloy-2 and Zircaloy-3 base alloys with uranium and without the addition of boron is characterized by the initial formation of a protective oxide film followed by a breakdown of the film and general spalling. Corrosion resistance is affected by prior thermal history. Addition of minute amounts of B greatly influences the corrosion rates and heat treatment responses.
(R4, 2-62, 2-60; Zr-b, U)

606-R. An Investigation of Uranium Corrosion in 100° C. Water and 200° C. Steam at Atmospheric Pressure. Oliver M. Stewart, Warren E. Berry, Paul D. Miller, Dale A. Vaughan, John B. Schroeder, Frederick W. Fink and Charles M. Schwartz. Battelle Memorial Institute. *U. S. Atomic Energy Commission BMI-1271,* June 19, 1958, 15 p.

Material balance studied by examination of the phase composition and valence state of the corrosion product and by hydrogen-evolution measurements. The corrosion rates in atmospheric-pressure steam above 100° C. are lower than those obtained in tests carried out in water with a hydrogen overpressure. 9 ref. (R4, 2-62; U)

607-R. Stress Corrosion Cracking of Austenitic Stainless Steels. H. H. Uhlig, John Lincoln, Jr. and Richard A. White. Massachusetts Institute of Technology. *U. S. Office of Technical Services,* PB 128219, Apr. 1957, 56 p. (Available at Library of Congress, Washington, D. C.; Microfilm $3.60, Photostats $9.20.)

Transgranular stress-corrosion cracking of 18-8 Type 304 specimens in 42% $MgCl_2$ does not depend on rate of stressing, whether specimens are bent in 10 min. or a fraction of a second. Addition of hydrochloric acid to $MgCl_2$ decreases cracking time, whereas addition to sodium hydroxide increases cracking time. (R1d; SS-e)

608-R. Investigation of Intergranular Oxidation in Stainless Steels and High-Nickel Alloys. Clarence A. Siebert, Maurice J. Sinnott, Lynn H. DeSmyter and Robert E. Keith. Michigan University. *U. S. Office of Technical Services,* PB 131471, June 1955, 110 p. $2.75.

Chromel alloys ASM, ARM and D and Type 310 stainless steels were oxidized for 100-hr. periods in the stressed condition. Intergranular oxidation measurements were obtained microscopically. Influence of stress, increasing time and temperature, water-vapor content of the air and preferred orientation. Visual and magnetic examinations on the oxidized specimens and their oxides. (R2h, R1h; SS, Ni-b)

609-R.* (German.) Effect of Different Impurities on Corrosion Resistance of Super-Pure Aluminum in Water at High Temperature and High Pressure. A. Domony. *Acta Technica,* v. 21, no. 1-2, 1958, p. 123-139.

Corrosion resistance of high-purity Al alloyed with different amounts of Si, Fe, Ti and B. Only Al containing certain kinds and amounts of foreign phase constituents was resistant. Corrosion behavior strongly enforced not only by formation of oxide films and electrochemical behavior of phases against base metal but also by depolarizing effect of alloy phases. 10 ref. (R4, 2-60, 3-69; Al)

610-R.* (German.) X-Ray Investigations of Scale Layers on Sintered Iron-Aluminum Compacts. Franz M. Oberhauser. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 343-345.

At an annealing temperature of 1350° C. granular scale films are formed of alpha Fe_2O_3. The lattice size of alpha Fe_2O_3 scale seems to be a little bigger than that of pure alpha Fe_2O_3. At 1200° C. the scale is composed of a Fe_3O_4 intermediate layer and an outer layer of alpha Fe_2O_3 and Fe_3O_4.
(R2q, M26; Fe, Al, 6-72)

611-R.* Current and Potential Relations for the Cathodic Protection of Steel in Salt Water. W. J. Schwerdtfeger. *Corrosion,* v. 14, Oct. 1958, p. 446t-450t.

Cathodic protection of steel specimens exposed for 60 days to both stagnant and aerated city water, to which was added 3% by weight of sodium chloride. 8 ref.
(R10d, R4b; ST)

612-R.* Processes of Electrochemical Corrosion. G. V. Akimov. *Corrosion,* v. 14, Oct. 1958, p. 463t-483t.

Theoretical considerations involved in determining the potential of hydrogen and oxygen electrodes. The theory of microcells is examined and some of the experimental data for processes with hydrogen depolarization reviewed. Influence of alloying elements on corrosion rates of metals in various media. Electrochemical cells with differential aeration, corrosion processes in a moisture film and atmospheric corrosion. 20 ref. (R1a)

613-R.* Corrosion Resistance of Ductile Iron. F. L. Laque. *Corrosion,* v. 14, Oct. 1958, p. 485t-492t.

Internal structure of ordinary gray iron, pearlitic ductile iron, ferritic ductile iron, malleable iron and mild steel compared. Differences in the amount of carbon present and in the form in which it occurs are responsible for some differences in the corrosion behavior of these materials. Data in acids, in neutral and alkaline solutions, in sea water, in the atmosphere and underground given. 14 ref.
(R-general, 3-71, CI-r)

614-R.* Long-Range Field Burial Study Probes Underground Corrosion. *Iron Age,* v. 182, Oct. 9, 1958, p. 77-80.

Corrosion of plain ferrous metals, low and high-alloy steel and iron, nonferrous metals in various soil types. (R8)

615-R. Pinhole Corrosion Testing of Aluminum-Clad, Nickel-Bonded Fuel Elements. C. L. Angerman and E. C. Hoxie. E. I. du Pont de Nemours & Co. *U. S. Atomic Energy Commission DP-269,* Feb. 1958, 24 p. $1.25. (Available from U. S. Office of Technical Services.)

A corrosion test was developed to indicate the quality of the bond between the Al cladding and Ni-plated U core of fuel elements. The rate of corrosive attack was found to be dependent on the distribution of the oxide phase in the bond. 11 ref. (R11; Al, Ni, U, 8-66)

616-R.* Influence of Radiation Upon Corrosion and Surface Reactions of Metals and Alloys. M. T. Simnad. Paper from "Effects of Radiation on Materials", Reinhold Publishing Corp., 1958, p. 126-143.

Changes in metal properties and changes in composition of ambient environment which result from nuclear irradiation and which influence surface reactions or corrosion. Corrosion of fissionable and nonfissionable metals in nuclear reactor by water or aqueous solutions. Influence of irradiation on gas-solid reactions; effect of proton radiation upon surface reactions. 34 ref.
(R-general, T11, N15, 2-67)

617-R.* (French.) Stress-Corrosion in Homogeneous Alloys. Ludwig Graf. *Corrosion et Anticorrosion,* v. 6, May 1958, p. 151-161.

Influence of mechanical strain on corrosion of mixed homogeneous crystals (Ag-Au; Cu-Au; Cu-Zn) in contact with chemical agents or with mercury. In the case of mercury the attack depended on the concentration of mixed crystals but was not influenced by inversion of proportion of crystal components. It reached a maximum at 50% Au. The increased activity of grain limits, or "effect of mixed crystals" is considered to be the initial cause of crack formation. 11 ref.
(R1d; Ag, Au, Cu, Zn)

618-R.* (French.) Standard Tests for Iron Corrosion and Cathodic Protection. *Corrosion et Anticorrosion,* v. 6, May 1958, p. 171-176.

Soil is tested as to structure and physical and chemical properties. Corrosion tests of Fe plates in different soil types established relation between corrosion intensity and ratio of water to air. Saturation limit of ground water determines the limits of active or passive iron behavior. The more this saturation limit is exceeded the weaker the effective cathodic protection on the Fe. Temperature and energy coefficients can be calculated. Cathodic protection has to be calculated according to soil resistance and aggressivity. 9 ref. (R8, R10d; Fe)

619-R.* (German.) Precipitation Processes and Intergranular Corrosion in Stainless Austenitic Chromium-Nickel Steel Containing Columbium. Karl Bungardt and Gustav Lennartz.

Archiv für das Eisenhüttenwesen, v. 29, June 1958, p. 359-364.

Analytical and X-ray observations on a steel with 0.056% C, 17.93% Cr, 10.92% Ni and 0.54% Cb to determine the influence of quenching temperatures between 900 and 1200° C., annealing temperature between 500 and 800° C. and annealing time between 2 and 10,000 hr. Relation between separation processes and resistance against intercrystalline corrosion during tests in a copper sulphate-sulphuric acid solution. Formation of Cr carbides and Cb carbides followed through the various phases. (R2h, 2-64; SS, *Cb*)

620-R.* (German.) **Electrochemical Properties of a Passive Austenitic Chromium-Nickel Steel, of a Chromium-Molybdenum Steel and Passive Electrolytic Chromium in Boiling 20% Sulphuric Acid.** Carl Carius. *Archiv für das Eisenhüttenwesen*, v. 29, July 1958, p. 449-461.

The processes on passive electrodes under the influence of "Redox" potentials analyzed. Current density-voltage diagrams for a steel with 18% Cr and 8% Ni, one with 27% Cr and 2% Mo and for electrolytical Cr in boiling sulphuric acid of 20% concentration after polarization times from 2 to 50 hr. Corrosion velocities are measured gravimetrically and compared. Corrosion current attacks the components Fe and Ni selectivity in the solid solution. 11 ref. (R6g; SS, Cr)

621-R. (Japanese.) **Indispensable Metals for Petroleum Industry.** S. Hijikata. *Metals*, v. 28, Sept. 1958, p. 641-646.

In the distillation process corrosion is mainly caused by sulphides, chlorides and organic acids. Most useful alloy is Cr steel (STB-35, STC-42E). If there is "below dew point corrosion", Cu alloy is better than STC-30, STC-42E, STC-42F. In the thermal cracking process up to 300° C., 4-6% Cr-steel is used. If H_2S is formed, lining of 11-13% Cr steel is preferable. In the re-forming process petroleum is heated at 500° C., so that stainless steel and Cr-Ni alloy are used. If lining is necessary, 405, 304 or 316 stainless steel is used. In general 316 or 317 steel is most reliable.
(R7a, T29n, 17-57; SS)

622-R.* (Polish.) **Mechanism of Formation of a Double-Layer Oxide Scale on Copper-Zinc Alloys.** Lucjan Czerski, Stainislaw Mrowec and Teodor Werber. *Archiwum Hutnictwa*, v. 3, no. 2, 1958, p. 113-123.

Oxidation was carried out in air at 900° C. on alloys containing 9 to 15% Zn. Compacted external layer composed of cuprous oxide formed as result of outward diffusion of Cu. Internal scale composed of bi-phase mixture of cuprous oxide and ZnO formed by inward diffusion of oxygen. Increasing concentration of Zn in the alloy raised ZnO content in the internal scale and resulted in increased rate of inward diffusion of oxygen. Contents of ZnO in internal scale decreased with increasing distance from metallic core. 15 ref.
(R1h, N1; Cu-b, *Zn*)

623-R.* (Russian.) **Role of Grain Size in Cavitation Erosion of Steel.** I. N. Bogachev and R. I. Mints. *Metallovedenie i Obrabotka Metallov*, Aug. 1958, p. 26-29. (Henry Brutcher, Altadena, Calif., Translation no. 4317.)

Metallographic analysis of ferritic and austenitic steels. Resistance to cavitation and erosion depends on grain size and character of grain boundaries. Intensity of cavitation is determined by joint effect of grain properties and boundaries. Results show importance of establishing relationship between cavitation-erosion resistance of steel and the properties of fine-grained steel structure. 5 ref. (R2m, 2-59; SS)

624-R.* **Erosion in Turbojet Fuel Nozzles.** H. R. Hazard, P. Gluck and R. W. Tate. *Mechanical Engineering*, v. 80, Oct. 1958, p. 58-60.

Laboratory procedure for simulating engine conditions. Radiochemical technique perfected for measuring erosion of a few millionths of a gram of material in a few hours. (R1c, 1-54, T24b)

625-R.* **Corrosion of Metals by Uranyl Salt Solution Using S^{35}.** Gunji Shinoda and Tadao Sano. *Osaka University, Technology Reports*, v. 7, Oct. 1957, p. 365-378.

Stainless steel containing Cb had high corrosion resistance and those containing Mo, Cu and other components corroded considerably; concludes that it is dangerous to decide corrosion tendency from weight loss. Reaction between the oxidized metallic ion (anion) and the uranyl ion (cation) which has strong oxidizing power; some kinds of U com-

pound will be formed.
(R6j, 1-59; SS)

626-R.* Increasing the Acid Resistance of Stainless Steels. *Platinum Metals Review,* v. 2, Oct. 1958, p. 117-119.

Cr steels with small (0.5%-1.0%) additions of Pt or Pd exhibit much lower corrosion rates in 20-50% H_2SO_4. 6 ref. (R6g; SS, *Pt, Pd*)

627-R.* The Corrosion of Thorium and Its Alloys. W. E. Berry, R. S. Peoples and H. A. Pray. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 267-276.

Reaction with gases; reaction with water; effect of alloy additions on corrosion of Th in high-purity water; solubility of Th in liquid metals. Th metal as a nuclear fuel appears to offer few corrosion problems in most liquid metal-cooled power reactors. On the other hand, apparently neither it nor its alloys are adequately resistant to water at temperatures of interest in pressurized water reactors. 12 ref. (R-general, R4, T11g; Th)

Results of extented stress-corrosion tests on Al-Mg alloys. Influence of alloy composition, strain hardening, hot forming, stress-relief, aging at atmospheric and elevated temperatures on resistance to stress-corrosion. Emphasis on properties of alloy 5456 and 5454. 93 ref.
(R1d; Al-b, *Mg*)

631-R.* Reduction of Failures Caused by Corrosion in Pumping Wells. T. A. Bertness. *American Petroleum Institute, Proceedings,* v. 37, Sec. 4, 1957, p. 129-135.

Chemical inhibitors are of value in protecting subsurface equipment only to the extent that they can be placed where they are needed in the quantity and frequency required to do their job. Problems associated with the placement of inhibitors for protection of equipment from an environment of scale and corrosion in pumping wells. Effect of loads on the life of rods; histories of test equipment and well-treating methods. 7 ref.
(R7a, R10b)

632-R.* How Environment Directs Corrosion Control. Robert V. Jelinek. *Chemical Engineering,* v. 65, Sept. 22, 1958, p. 163-168.

Causes and nature of corrosion, influence of pH, oxidizing agents, liquid velocities and temperature. Control by inhibitors and cathodic protection. 20 ref.
(R-general, R10)

633-R.* Corrosion Resistance of Austenitic Nickel-Chromium Steel. W. Katz. *Draht (English Edition),* no. 36, Aug. 1958, p. 27-31.

Passivity and corrosion, effects of the alloy components, forms of corrosion and properties of austenitic steels in contact with various substances. 20 ref. (R-general; SS)

634-R.* Role of Hydrogen in the High-Temperature Corrosion of Zirconium and Its Alloys. Pt. 1. The Effect of Cathodic Polarization on Corrosion in Water at 325. J. N. Wanklyn and B. E. Hopkinson. *Journal of Applied Chemistry,* v. 8, Aug. 1958, p. 496-504.

Binary Zr alloys and Zircaloy 2 have been corroded in water at 325° C. with and without cathodic polarization. In some cases polarization can increase hydrogen uptake or reduce the protective character of the oxide films as assessed by capacity measurements. Alloying elements significantly influence both effects, but comparison of the alloys shows no systematic relation between their hydrogen uptakes and the loss of protective character of their films. Films formed in a previous period of unpolarized corrosion are damaged when polarized at 325° C. and at room temperature. 12 ref. (R4, 2-62; Zr-b)

635-R.* Pores and Pitting of Plated Deposits. J. M. Odkerhen. *Metal Finishing,* v. 56, Oct. 1958, p. 64-66.

Pores and pitting can be attributed to base material—porous base or poor mechanical pretreatment or occlusions in the material; chemical pretreatment; plating solution—suspended material or dissolved impurities. (R2j, L17c; 8-12)

636-R.* (Spanish.) **Nitroamines in the Protection of Iron Against Corrosion.** Mario Petit and Fernando Estalella. *Revista de Ciencia Aplicada,* v. 12, July-Aug. 1958, p. 293-298.

Ferrous metals wrapped in paper impregnated with nitrite of dicyclohexylamine or tri-ethanolamine in amounts in excess of 0.05 g. per sq. dm. effectively protected against oxidation produced by atmosphere saturated with water vapor at a temperature of 22±2° C. Procedures for preparing these corrosion inhibitors and their properties. 20 ref. (R10b, R10e; Fe, ST)

637-R.* **Oxidation of Metals; Determination of Activation Energies.** Per Kofstad. *Acta Chemica Scandinavica,* v. 12, no. 4, 1958, p. 701-707.

New method for determination of energies of activation of oxidation of metals and alloys. Metals are oxidized under conditions of linearly increasing temperature and the activation energy may be determined from one single oxidation run. In addition the method also gives the approximate temperature regions in which different rate laws of oxidation are found. Method has been applied to high-temperature oxidation of Ni, Zr, Cu and Ti. 18 ref. (R1h, P13a; Ni, Zr, Cu, Ti)

638-R.* **The Behavior of Zinc Coatings in Marine Conditions.** *Corrosion Prevention and Control,* v. 5, Sept. 1958, p. 45-48, 74.

Coatings of Al, Cd, Pb, Sn, Zn, 88-12 Cd-Sn, and 88-12 Pb-Sn alloy were applied to mild steel specimens containing 0.2% C. After two years totally submerged in sea water all the Zn coatings were found to be intact; Al coatings applied by molten metal or wire pistols were almost intact; Cd behaved fairly well, but all the other coatings were unsatisfactory. (R4b; Zn, Al, Cd, 8)

639-R.* **Castings Withstand Corrosion.** *Iron Age,* v. 182, Oct. 16, 1958, p. 194-195.

Cast stainless alloys intended for operation at temperatures below 900° F. They are used in chemical plants, oil refineries, textile and paper mills, sanitation, building construction and transportation. Chemistry of these alloys, suitable applications.
(R-general, 17-57, T29; SS)

640-R.* (French.) **Oxidation of Nickel by Ionic Bombardment.** J. J. Trillat, L. Tertian and N. Terao. *Cahiers de Physique,* no. 92, Apr. 1958, p. 161-162.

Thin film of Ni resting on support of NaCl was bombarded in electron diffractograph by ions from surrounding atmosphere; heating of specimen was avoided by sweeping ion beam. Bombardment provoked formation of a NiO oxide film oriented according to lattice of the metal, and progressively removed the surface layers of oxide thus formed without modifying their structure. Under conditions of experiment, appearance of Ni_3N does not occur, contrary to case of bombardment of thin film of Ni without supporting material. 7 ref.
(R1h, R2r; Ni)

641-R.* (French.) **Contribution to Study of Mechanism of Corrosion of Magnesium and Its Alloys.** Guy Bronoel. *Comptes Rendus,* no. 246, May 12, 1958, p. 2750-2753.

High-purity Mg and a Mg alloy containing 3% Al, 1% Zn, and 0.02, 0.016, 0.012 and 0.0006% Fe were studied. The potential/pH curves for electrodes in hydrochloric acid solutions were obtained. Experiments were made at 20, 30, 40 and 50° C. in the presence of air or under a nitrogen atmosphere. Comparative measurements were made without agitation and after violent agitation of the solution in the region next to the electrode.
(R6; Mg)

642-R.* (French.) **Interesting Properties of the General Electrical Field.** D. Petrocokino. *Corrosion et Anticorrosion,* v. 6, July-Aug. 1958, p. 241-251.

Mechanism of dissolution, thermodynamic and electrokinetic factors; modern theories on formation of metallic interface. Measurement of electrochemical potentials does not take into account phenomenon of double layer and gives only an interface potential with relation to solution. Concept of electric field created during corrosion process is presented as clew to understanding of inhibition of corrosion by means of artificial cathodic and anodic fields. 19 ref. (R1a, R10b)

643-R.* (French.) **Vapor Phase Inhibitors.** Giorgio Mantovani. *Corrosion et Anticorrosion,* v. 6, July-Aug. 1958, p. 258-264.

Types and properties of inhibitors. Results of accelerated corrosion tests on steel, Cu brass and Al in presence of SO_2 and in ordinary atmosphere. Temperature and surface condition (smoothness or

roughness) of metal greatly influence amount of corrosion occurring on surfaces protected by vapor phase inhibitors. 34 ref. (R10b)

644-R. Corrosion and Creep Behavior of Tantalum in Flowing Sodium. Gilbert E. Raines, C. Vernon Weaver and John H. Stang. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1284, 24 p. Aug. 21, 1958. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.00.

Corrosion behavior of commercial Ta in high-purity flowing sodium from 700 to 1200° F. and the effect of sodium exposure on the creep strength of Ta at 1200° F. Tests were conducted in forced-convection flow loops constructed of Type 316 stainless steel. Corrosion tests yielded information about the partition of interstitials, particularly oxygen, in the sodium-tantalum system. 9 ref. (R6q, Q3; Ta)

645-R. Relation Between the Structure of a Magnesium Alloy and Its Tendency to Corrode Under Strain. M. A. Timonova. *Academy of Sciences of the USSR, Proceedings,* v. 115, (1957), p. 777-779. (Translation by Consultants Bureau, Inc.)

Al is principal component responsible for corrosion in Mg-Al-Zn-Mn system if in concentrations of over 2-3%. Corrosion of Mg alloys due to selective dissolution of supersaturated solid solution, or of Mg_4Al_3. (R1d; Mg-b, Al-b)

646-R.* (Japanese.) **Simple Method of Preventing Rusting of Iron Products.** Y. Yamamoto. *Metals,* v. 28, Sept. 1958, p. 659-662.

Complete protection is not possible but limited protection is provided by methods such as cleaning, moisture-removal by silica-gel, activated alumina etc., painting with $ZnCrO_4$ paint, asphalt paint, petrolatum-grease, rustproof petrolatum, spindle oil, rustproof grease, packing of $(C_6H_{10})_2NH_3HNO_2$, and plastic film lining.
(R10a, R10f, L26; Fe-b)

647-R.* (Rumanian.) **Contribution to the Study of Resistance to Corrosion of Nodular Graphite Castings.** Irina Cornea. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 37-48.

Tests on resistance to corrosion by hydrochloric acid of nodular graphite iron in comparison to gray iron. The hypothesis was that nodular graphite iron must have a better behavior than gray iron in non-oxidizing acids, because in the former the cathode surface—the graphite—is smaller than in the latter. When corrosion takes place with depolarization by hydrogen, the ratio between cathode and anode surfaces determines the rate of attack resistance to corrosion was almost double for nodular graphite iron than for gray pig iron. 5 ref.

648-R.* (German.) **Painting and Long-Time Corrosion Testing of Steel.** Gerhard Becker. *Stahl und Eisen,* v. 78, Aug. 21, 1958, p. 1186-1191.

Nineteen steels were painted and exposed to an industrial atmosphere for 22 years. Si-killed steels with low Cu and Mo alloying components showed the best weather resistance. Paints on rimming steels were less durable than on Si-killed steels.
(R3n; ST, 8-70)

649-R.* (Japanese.) **Corrosion and Erosion of Screw Propellers.** M. Kanamori and S. Ueda. *Metals,* v. 28, Sept. 1958, p. 647-651.

Mn bronze and Ni-Al bronze are mainly used. Corrosion of screw propellers in sea water is caused by an electrolytic reaction in weak alkali solution in which O_2 is dissolved, and ionized Zn is removed from Mn bronze (or Al is removed from Ni-Al bronze). Cavitation erosion is caused by an impulse which is at most 200 kg. per sq. mm. Furthermore, screw exerts torque, friction and centrifugal force, which exert tension, bending, torsion and compressive stress, and hence mechanical strength is necessary. (R4b, T22h, 17-57; Cu-s)

650-R.* (Japanese.) **Sea Water as Industrial-Water; Cathodic Protection From Electrolytic Corrosion.** T. Otobe. *Metals,* v. 28, Sept. 1958, p. 652-658.

The screen for an inlet is almost completely protected by cathodic protection. Voltage is around 12 volts and current is 10 to about 20 amp. for a bar-screen and 20 to about 30 amp. for a rotary screen. An ordinary iron screen can be used as long as there is cathodic protection. A sea-water pump should be protected in the same way. Zn anode is located on mouthpiece of pump. A sea-water pipe is also protected, but if the radius of the pipe is less than 5 in. the method cannot be applied.
(R10d, R4b)

651-R.* (Japanese.) **Potential-pH Diagram for Corrosion.** T. Okamoto and S. Nagayama. *Metals,* v. 28, Sept. 1958, p. 665-673.

Corrosion of metal is considered to be an electrochemical reaction (i.e., oxidation and reduction by means of electron transfer). The reaction rate depends on concentration, pressure, and especially on electric potential. If equilibrium potential lies between the potential of hydrogen and of metal the reaction can occur, otherwise cannot. The change of Gibbs free energy is related with chemical potentials of the constituent elements and equilibrium potential of the reaction. From this equation, one can get a diagram of the potential versus pH. (R1a)

652-R. Corrosion Cracking of Austenitic Steels at Elevated Temperatures and Pressures. V. P. Sidorov and A. V. Ryabchenko. *Metallovedenie i Obrabotka Metallov,* v. 4, June 1958, p. 25-32. (Henry Brutcher, Altadena, Calif., Translation no. 4250.)

Corrosion resistance of austenitic steels was investigated in aqueous solutions under high pressures and temperatures. Steels exposed to the actions of distilled water with limited addition of oxygen for 500 hr. at 300° showed no corrosion cracks. Solutions of NaCl, Na_3PO_4, Na_2SO_4, Na_2HPO_4 and Na_2SO_3 produce no cracks in austenitic steels. Addition of the NaCl to basic solutions inhibit tendency toward cracking. Heat treatment does not affect corrosion resistance. 8 ref. (R4, R6, 2-62, 3-74; SS)

653-R.* (Russian.) **Gaseous Corrosion of Titanium-Base Alloys Subjected to Furnace or Induction Heating.** V. A. Yakovlev and Ya. I. Spektor. *Metallovedenie i Obrabotka Metallov,* June 1958, p. 52-56. (Henry Brutcher, Altadena, Calif., Translation no. 4255.)

Corrosion in furnaces with moist air is more intensive than in those with air dried by high temperature. Corrosion in undried atmosphere rapidly rises at 700°. In induction heating to 1200° at the rate of 10-50° per sec. the depth of change in the surface layer is 5-6 times less than in furnace heating. Scale formation in induction heating is shifted upward about 200° when the rate of heating is increased. 4 ref. (R7g; Ti)

659-R.* (French.) **Formation of White Rust.** A. Herz. *Metallurgie et la Construction Mecanique,* v. 90, July 1958, p. 559-561.

Composition of white rust on Zn, conditions under which it is formed, influence of temperature and humidity; protection by passivation, grease films, flexible paints. (R1h, R10; Zn)

660-R.* (Serbian.) **Stress-Corrosion Cracking of Austenitic Stainless Steels in Magnesium Chloride Aqueous Solution.** T. P. Hoar and J. G. Hines. *Zastita Materijala,* v. 5, no. 4, 1957, p. 127-137.

Electrochemical behavior of 18-8 stainless steel wire stressed in a hot concentrated $MgCl_2$ solution depends on magnitude of applied stress, temperature, composition of steel and thermal treatment. Cathodic protection gives good results. (R1d, 2-62, R6g; SS-e)

661-R.* (French.) **Protection of Light Metal Assemblies in Aircraft Construction.** Paul Roussetbert. *Corrosion et Anticorrosion*, v. 6, Sept. 1958, p. 272-287.

Cathodic protection (cladding), chemical oxidation, anodic oxidation and organic coatings as applied to wing and fuselage assemblies, homogeneous or heterogeneous, either riveted, welded or bolted. Role of each type of protection; principles and description of processes.
(R10, L-general, T24; EG-a39)

662-R.* (French.) **Protection of Steel Against Underground Corrosion.** Kurt F. Tragardh. *Corrosion et Anticorrosion*, v. 6, Sept. 1958, p. 292-297.

Study of corrosion of buried steel framework in Swedish electrical power supply system. For mildly aggressive soils, hot dip galvanizing provides adequate protection. For highly corrosive soils, extra thickness of steel (1, 2 or 3 mm., depending on nature of soil) is recommended in addition to galvanizing.
(R8, L16; ST, *Zn*)

663-R.* (French.) **Statistical Study of a Case of Corrosion.** Cl. Meyer. *Corrosion et Anticorrosion*, v. 6, Sept. 1958, p. 298-317.

Corrosion of bottom of steel reservoir for hydrocarbons which was being retired from service. Purpose was to determine extra thickness of bottom plate to allow for replacement reservoir. Problem was handled by method of "population sampling" and statistical analysis. 7 ref. (R7g, S12; ST)

664-R. (Russian.) **Trials of Stainless Steel for Use in Injection Needles.** A. T. Nesterenko. *Meditsinskaya Promyshlennost SSSR*, no. 4, 1957, p. 13-18.

Stainless steels studied were 1 Kh. 18N9, 2 Kh. 18N9, 2 Kh. 18NGT, 2 Kh. 18N8V4, 2 Kh. 13n8G4, 2 Kh. 13N4G9 and 2 Kh. 13G16. To determine the mechanical properties and capacity for cold working, steels were drawn with reduction of 10, 20 and 30%. Needles were boiled in water for one day (8 hr. boiling, 16 hr. held on a grid in steam) to determine corrosion resistance. Steel 2 Kh. 18N8V4 gives evidence of possessing superior mechanical and corrosion resistant properties.
(R4, T10e, 17-57; SS)

665-R.* **A Nondestructive Test for Intergranular Corrosion in Stainless Steel.** R. C. Robinson. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM, STP no. 223, 1958, p. 112-118.

Variations in resistivity of sound and corroded samples of tubing allow accurate determination of extent of corrosion.
(R2h, R11, S13h; SS)

666-R.* **Development of Oxidation-Resistant Niobium Alloys.** Harry P. Kling. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 87-91.

Samples of Cb and Cb alloyed with V, Mo or Ti were oxidized in air at elevated temperatures. Results of microscopic, chemical and electrical conductivity studies on oxide scale form basis for discussion of oxidation rate and mechanism. 6 ref. (R1h; Cb-b)

667-R.* **Preliminary Study of the Effect of Binary Alloy Additions on the Oxidation Resistance of Columbium.** Francis J. Clauss and Charles A. Barrett. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 92-97.

Addition elements, Ti, V, Cr, Zr, Mo, Ta, W, Fe, Co, Ni, Ir, Al, Si, Cu, Ge, Se and Re were added singly in 1, 2, 3, 5, 10 and 25 at. % and specimens were fabricated by powder metallurgy. Nature of scale and resistance to oxidation were evaluated by continuous exposure to dried air for 4 hr. at 1000° C. and 2 hr. at 1200° C. (R1h, 2-60; Cb-b)

668-R.* **Oxidation of Columbium-Chromium Alloys at Elevated Temperatures.** Charles A. Barrett and Francis J. Clauss. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 98-105.

Oxidation rates and scale characteristics were determined for Cb alloys containing 0.8 to 11.6 % Cr at 800, 1000 and 1200° C. At 800° C., optimum Cr concentration for soundest scale and lowest oxidation rate was found at 5 to 8%. At 1000° C., scale characteristics and oxidation resistance improved with increasing Cr. At 1200° C., Cr had no appreciable effect in range studied. 12 ref.
(R1h, 2-62; Cb-b, *Cr*)

669-R.* (German.) **Chemical and Electrochemical Aspects of Corrosion in Atomic Piles.** G. H. Cartledge. *Werk-*

stoffe und Korrosion, v. 9, Aug-Sept. 1958, p. 493-503.

Formation of metal-protective film-solution under normal conditions; corrosion reactions caused by the products of nuclear fission. 44 ref. (R1, T11g, 2-67)

670-R.* (German.) **Corrosion and Passivity.** U. F. Franck. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 504-513.

Corrosion processes and passivity in metallic materials are of electrochemical nature. It is possible to show that the passive state is caused by very thin nonmetallic films. These films are characterized by certain properties of electric conductivity. Corrosion behavior of passivated metals is governed by the chemical and electric properties of the films and not by the basic metal. 63 ref. (R10c)

671-R.* (German.) **Protection Against Corrosion.** K. Thalhofer. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 515-517.

Construction of modern cathodic protection installations for old pipelines (water, gas) in densely populated as well as in industrial districts is meeting increasing difficulties. The number of buried pipes makes it necessary to extend the protective installations. (R10d, W13h)

672-R.* (German.) **Intercrystalline Corrosion of Chromium-Nickel Steels.** M. Prazak. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 517-519.

Electrical etching test using saturated calomel electrode for determining passivation potential of grain boundaries. 12 ref. (R2h, 1-54; SS)

673-R.* (German.) **Corrosion of Lead Pipes.** E. L. Schmeling and B. Roeschenbleck. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 529-532.

Pitting of waste water pipes made of Pb always shows identical characteristics. Areas around corroded spots are covered with lead sulphide and basic carbonate. Current density-voltage curves were plotted under various conditions; corrosion potential and corrosion current determined. 8 ref. (R1a, R2j; R4; W13h, Pb)

674-R.* (German.) **Corrosion of Aluminum and Its Alloys.** O. Sverepa. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 533-536.

In river waters corrosion was low and uniform, while there was pitting corrosion in circulating waters. Composition and impurities in the water influence corrosion. Differences between the corrosion behavior of different materials were slight. Al-Mn and Al-Mg alloys were most severely corroded by mutual action of Cu^{++}, Cl', Ca^{++}, HCO_3' in presence of oxygen. Pitting corrosion depends largely on concentration of the ions mentioned. (R4, R2j; Al)

675-R.* (German.) **Passivation of Zinc.** L. Cerveny. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 543-547.

An effective passivating agent is the vapor of tertiary butanol chromate. A temporary action passivates the metal and decreases the velocity of corrosion. Resistance to corrosion depends on duration of the action of the passivating agent. In the reaction between Zn and the vapors of tertiary butanol chromate, the partial pressure of the air determines velocity of passivation. 6 ref. (R10c; Zn)

676-R.* (German.) **Influence of Dust on the Atmospheric Corrosion of Metals.** K. Barton. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 547-549.

Properties of several natural and artificial dusts which may influence corrosion processes. Absorption capacity for water vapor and sulphur dioxide and influence of soluble components; composition of dusts and their pH-value. Corrosion tests on unprotected steels, Cu, Zn and Al in presence and absence of sulphur dioxide at different humidities were carried out in presence of dust. (R3, R11)

677-R.* (German.) **Measurement of Intercrystalline Corrosion by Resonance Vibration.** K. Smrcek. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 550-552.

A specimen showing intercrystalline corrosion is subjected to the vibrations of a magnetic exitor which is fed by an amplified vibration generator. When the frequency of resonance changes according to the degree of corrosive attack, the sound of the specimens changes; this point is also indicated by means of silicon carbide powder which is gathered in the nodal point. (R2h, R11a)

678-R.* (German.) **Diagnosis of the Causes of Corrosion Processes.** G. Schikorr. *Werkstoffe und Korrosion*, v. 9, Aug-Sept. 1958, p. 552-556.

Composition, distribution, color, velocity of dissolution and crystal structure of the corrosion products may indicate the causes of corrosion. Some diagnoses are reliable, others are reliable only under certain conditions. 6 ref. (R-general, R11)

679-R. (Hungarian.) **Lead Alloys for Batteries.** Pesti Laszlo. *Kohaszati Lapok*, v. 12, no. 1-2, 1957, p. 53-57.

The Pb-Sb (6-12% Sb) alloy is not satisfactory because Sb dissolves in H_2SO_4. The replacement of Sb by Cd deserves attention. A Pb alloy with 2% Sb and 1% Cd gives good results. Addition of 0.05-0.1% Te increases strength and corrosion resistance of Pb. Li, 3 or 1%, in combination with K, Na or Rb, also increases the hardness. An alloy containing 0.02% Li, 0.3% Na, 0.05% Ca has tensile strength of 20 kg. per sq. mm. and possesses good corrosion resistance. Beneficial action of As and Ag noted. (R6g, Q27a, Q29n, 2-60, T1; Pb)

680-R.* (Japanese.) **Metal Surfaces and Corrosion.** N. Ohtani. *Metals*, v. 28, Oct. 1958, p. 736-740.

Corrosion is more or less influenced by the valence electrons of metals. Irregularity on the surface induces a local polarization which may accelerate corrosion; polarization potential and hydrogen overvoltage are the most important factors. Impurities and scratches cause most corrosion. (R-general)

681-R.* (Japanese.) **Underground Corrosion and Its Prevention.** H. Okubo. *Metals*, v. 28, Oct. 1958, p. 782-784.

Corrosion is caused by electrolytic reaction. If the specific resistivity of soil is less than 2300, corrosion is more serious. This kind of corrosion is caused by local electric current which depends on the nonuniformity of the surface, contact of two different metals, nonuniformity of soil and bacteria. Protection may be provided by plating with glass coating, enameling, plastic coating and cathodic protection. (R8)

682-R. How Oxidative Corrosion Occurs. Robert V. Jelinek. *Chemical Engineering*, v. 65, Aug. 25, 1958, p. 125-130.

Principles of electrochemical corrosion. (R1a)

683-R. Compound Inhibits the Formation of Tenacious Scale. *Design Engineering*, v. 4, Sept. 1958, p. 63.

New compound inhibiting formation of tenacious scale on stainless steel, Ni-Cr and alloys of Co, Ti and Cu during heat treatment. (R10b, R2q; SS)

684-R. Protection of Iron by Rust Stabilization. *Industrial Finishing (London)*, v. 10, Sept. 1958, p. 47.

By converting rust to stable oxides of iron, "Corroless" provides a priming coat which can be applied direct to the metal without any elaborate cleaning procedure. (L26n, R1h, R2q, R10g; Fe)

685-R. (Japanese.) **Pinholes in Aluminum Pots.** T. Fukushima. *Metals*, v. 28, Sept. 1958, p. 663-664.

Pinholes result when low pH water is boiled, or chloride or sulphide is contained in water. Almite film is a good protector, but thick film is required. (R2j, T10a; Al-b)

686-R. Behavior of Some Aluminum Alloys in a Chromic-Phosphoric Acid Mixture. K. M. Carlsen. *Aluminum*, v. 33, Feb. 1957, p. 101-103. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. 58-1504.)

692-R.* (Czech.) **Corrosion Observed in Weldments of Stainless and Heat Resistant Steels.** Josef Nemec. *Zvaranie,* v. 7, July 1958, p. 193-196.

"Knife-cut" corrosion occurs with stabilized 18-8 steels, near the contact line between weld and base metal. Observed under boiling HNO_3, HNO_3 solutions and NaF. Favored by more than 0.08-0.10% C in steel; Ni near upper limit, Cr and Ti or Cb near lower limits; coarse grain at contact line. Reduced by increased Ti or Cb; several welded layers not exposing contact line. Stress-corrosion avoided by choice of steels and relief annealing. Slag from coated electrodes causes corrosion by passing atmospheric O and S to the metal and should be removed by sandblast. 7 ref. (R-general; SS, 7-51)

693-R.* (German.) **Attack of Iron-Saturated Zinc Melts Upon Iron Which Contains Molybdenum.** Dietrich Horstmann. *Archiv für das Eisenhüttenwesen,* v. 29, Aug. 1958, p. 463-466.

During the attack of Zn melts upon Fe containing up to 5.25% Mo, the Fe losses and the formation of layers of Fe-Zn alloys are observed in terms of time and temperature. At lower Mo contents the attack upon the Fe is strong, and decreases with Mo content up to 5%. At low and high temperatures the time diagram has parabolic shape; in the intermediate range it is linear. (R6m; Fe, *Zn, Mo*)

694-R.* (German.) **Mechanism of Passivation and Formation of Protective Layers.** Theo Hermann. *Archiv für das Eisenhüttenswen,* v. 29, Aug. 1958, p. 505-512.

Survey of research in the field of passivation; discussion of layers, electrochemical and other measuring methods. The mechanism of formation and decomposition of passive layers on Fe, Ni, Cr, Al and Ti as well as the behavior of Fe-Cr alloys and Cr steels. 33 ref.

695-R.* (German.) **Resistance to Welding and the Oxidation Behavior of Contact Points Made From Silver-Graphite.** A. Keil and W. Merl. *Metall,* v. 12, July 1958, p. 619-622.

Oxidation behavior of silver-graphite materials is largely dependent on the graphite contents. Doubling the graphite content increases the rate of destruction through burning 10 to 12 times. Therefore, this material is suitable only on bounce-free switch gear. Through double sintering the life of contact points was increased by 100% and more without reducing the resistance against welding. 7 ref.
(R1h; Ag, NM-k36, SGA-r)

696-R.* **Corrosion of Titanium in Sulfuric Acid and Chlorine.** L. W. Gleekman. *Corrosion,* v. 14, Sept. 1958, p. 21-22.

Tests find suitable materials of construction to handle both chlorine gas being dried by sulphuric acid, and sulphuric acid saturated with chlorine. Passivating effect of chlorine in presence of water is apparent mechanism which retards corrosion of Ti in sulphuric acid.
(R6g, R6q; Ti)

697-R.* **A Review of the Gas Condensate Well Corrosion Problem.** D. R. Fincher. *Corrosion,* v. 14, Sept. 1958, p. 23-24.

Corrosion control in wells with shut-in pressure above 5000 psi. Methods of applying inhibitors in

wells include sticks, liquid lubricators, chemical pumps and pump trucks, dump bailers, chemical injection valves in tubing, bottom hole chemical pumps, bottom hole chemical injectors, chemical squeezes. 9 ref. (R10b, T28)

698-R.* Corrosion Resistance of Titanium Alloys Compared With Commercially Pure Titanium. David Schlain and Charles B. Kenahan. *Corrosion,* v. 14, Sept. 1958, p. 25-28.

Ti alloys are similar to commercially pure Ti in chemical and galvanic corrosion properties, and have low corrosion rates. They resist synthetic ocean water, tap water, sodium hydroxide (1%) and ferric chloride (5%) solutions. In aerated sulphuric acid solutions, Ti alloys, except Ti-Cu, are corrosion resistant and vary with temperature and concentration of acid; Ti-Cu alloys are more resistant in sulphuric and less resistant in hydrochloric acid. 7 ref. (R4, R6; Ti-b, Ti-a)

699-R. Effect of the Concentration of Various Salts on the Dissolution of Cadmium in Air-Saturated Solutions. Charles J. Boone and Cecil C. Lynch. *Corrosion,* v. 14, Sept. 1958, p. 29-31.

Initial dissolution rate of Cd in varying concentrations of potassium, sodium and barium chloride, potassium and sodium bromide, potassium and sodium iodide, and sodium and barium perchlorate examined polarographically. Nature of anion had much greater effect on rate than did the nature of cation. Inhibiting action by perchlorate ion and fast corrosion rate of iodide salts are due to anion polarization. 18 ref. (R6j; Cd)

700-R.* Corrosion Behavior of Zirconium-Uranium Alloys in High-Temperature Water. Warren E. Berry and Robert S. Peoples. *Corrosion,* v. 14, Sept. 1958, p. 34-38.

Corrosion increased with increase in water temperature, and oxygen and uranium content. Corrosion behavior determined by amount and distribution of epsilon phase in alloys less than 55% U and alpha phase in alloys greater than 60% U. Increase in corrosion rate in alloys of 45 to 55% U can be correlated with the effect of oxygen on the stability of epsilon phase. Microstructures reveal increase of second phase (alpha Zr) with increasing oxygen content. 13 ref. (R4, 2-61, 3-71; Zr-b, U)

701-R.* Corrosion and Water Purity Control for the Army Package Power Reactor. Richard J. Clark and A. Louis Medin. *Corrosion,* v. 14, Sept. 1958, p. 39-43.

Reactor produces 2000 kw. of electricity, and has a pressurized water system. Primary purification system performance data on individual components. Experimental in-plant equipment for determining crude levels, corrosion rates and other related parameters. Corrosion rate of components has been lower than originally estimated. 4 ref. (R4, T11, W11p)

702-R.* Some Relations Between Deposition and Corrosion Contamination in Low Make-Up Systems for Steam Power Plants. E. S. Johnson and H. Kehmna. *Corrosion,* v. 14, Sept. 1958, p. 49-54.

Mechanism is postulated which indicates that ratios and interactions of contaminants are more significant to deposition than the absolute amount of contaminants. Examples cited. Mechanisms based upon thermodynamics of soluble ions from corrosion of materials of construction can qualitatively account for form and composition of deposits. Trouble from deposits depends on ratio of Cu to Fe rather than the absolute concentrations of either. Small variations in the concentration of other ions are not important. 3 ref. (R4, W11g)

703-R.* Corrosion of Metals in Tropical Environments. Pt. 2. Atmospheric Corrosion of Ten Structural Steels. C. R. Southwell, B. W. Forgeson and A. L. Alexander. *Corrosion,* v. 14, Sept. 1958, p. 55-59.

Tests made by exposure to seashore and inland environments in Panama Canal Zone. Corrosion rates compared with existing data for the same materials in temperate zones. Effects of low-alloy additions on mild carbon steel. Ni and Cr steels were most corrosion resistant, while Cu steel proved slightly better than unalloyed mild steel. Low-alloy steels showed good corrosion resistance. 9 ref. (R3s; AY)

704-R.* Electrochemical Behavior of Aluminum. E. Deltombe and M. Pourbaix. *Corrosion,* v. 14, Nov. 1958, p. 496t-500t.

Potential-pH equilibrium diagram of the system aluminum-water at 25° C. was developed from the standard free energies of the constituents and the general electro-

chemical behavior of Al was deduced from the diagram. Diagram indicates the theoretical circumstances in which Al should show corrosion, immunity, and passivity, under the hypothesis that the passivation results from the formation of a film oxide whose stability resembles that of hydrargillite. 29 ref. (R11m; Al)

705-R.* Corrosion-Resistant Experimental Steels for Marine Applications. C. P. Larrabee. *Corrosion,* v. 14, Nov. 1958, p. 501t-504t.

Six steels having various combinations of Ni, Cu and P tested in sea water for periods of 1, 2 and 5 years and compared with corrosion resistance of structural carbon steel. Decreases in thickness were calculated at 20 different levels for each of the Ni-Cu-P steels. Steel containing 0.5% Ni, 0.5% Cu and 0.12% P had the greatest resistance. (R4b, 2-60; AY, *Ni, Cu, P*)

706-R.* Laboratory and Field Methods for Quantitative Study of Sulfide Corrosion Cracking. J. P. Fraser, G. G. Eldredge and R. S. Treseder. *Corrosion,* v. 14, Nov. 1958, p. 517t-532t.

Test apparatus and procedures for studying sulphide corrosion cracking may have general applications in the broader field of stress-corrosion cracking. A quantitative means of expressing the relative susceptibility to cracking of a specific alloy in a specific environment may be obtained. Influence of a number of test variables such as stress raisers, composition of test solution, time of exposure and type of loading on the "critical strain" determination. 9 ref. (R1d, R7k; SS)

707-R.* Influence of Metallurgical Variables on Resistance of Steels to Sulfide Corrosion Cracking. J. P. Fraser and G. G. Eldredge. *Corrosion,* v. 14, Nov. 1958, p. 524t-530t.

Statistical study of sulphide corrosion cracking as a function of chemical composition, mechanical properties and heat treatment. Of 104 alloy steels studied, 79 were commercially produced API grades J-55, N-80 and P-110 steels. Resistance to cracking is increased most rapidly by increases in ductility and in carbon content. Resistance to cracking is decreased most rapidly by increases in hardness, strength and Mn and Mo content. 9 ref. (R7k; AY)

708-R.* Limitations on Chemical Means of Controlling Corrosion in Boilers. Douglas E. Noll. *Corrosion,* v. 14, Nov. 1958, p. 541t-544t.

Five examples of boiler tube failures caused by corrosion. Iron migration theory. Corrosion can occur despite the use of chemicals in boiler water. Two chemical methods of corrosion control are control of alkalinity and acid cleaning. Under certain operating conditions periodic acid cleaning of boilers is essential if tube failures are to be avoided. 21 ref. (R4c, R10a; ST)

709-R.* Corrosive Influences Peculiar to Sewage. A. G. Arend. *Corrosion Prevention & Control,* v. 5, Aug. 1958, p. 41-42.

Corrosion in sewage pipe lines differs from corrosion in normal water, which contains more oxygen than sewage. Deposits which accumulate on metal surfaces in contact with sewage give no protection. Compounds of chlorine, sulphur and ammonia present in sewage destroy brickwork, concrete and iron. Ventilation facilitates removal of gases and speedy conveyance of sewage helps to prevent corrosion. (R4j)

710-R.* Effect of Surface Active Agents on the Formation of Boiler Scale. G. H. Ireland. *Corrosion Prevention & Control,* v. 5, Oct. 1958, p. 57-60.

Mechanism suggested for the formation of the common calcite and anhydrite scales frequently found on heating and cooling surfaces of industrial plant. Types of treatment are compared; advantages of the use of specially developed organic surface active agents. Related compounds, such as anti-foams, oxygen scavengers and neutralizing amines; their applications. (R2q, R4c, R10b)

711-R.* Water Main Protection. *Corrosion Prevention & Control,* v. 5, Oct. 1958, p. 63-64.

Technique which makes use of a range of materials developed from petroleum jelly under the trade name Denso. They retain their plasticity indefinitely over a wide range of temperatures. (R10e, T26r)

712-R.* Ships' Bottom Paints in Relation to Cathodic Protection. T. A. Banfield. *Corrosion Technology,* v. 5, Aug. 1958, p. 243-246.

Cathodic protection principles and design of installations including type

and composition of anode materials. Tests prove that non-saponifiable such as vinyl, bituminous materials and some types of synthetic rubbers are the best coatings for bottoms of cathodic protected ships, particularly on areas close to the anodes. 11 ref. (R10d, L26, T22g)

713-R.* Developments in Ships' Protective Coatings. F. Perkins. *Corrosion Technology,* v. 5, Aug. 1958, p. 247-249.

Analysis of sources and mechanisms of corrosion with methods of preventing the electrochemical reaction. Polymers, vinyls, bituminous materials and chlorinated rubber for underwater coatings; top-side paints; primers and paints that give diversity of service and protection. (R4b, T22g, L26)

714-R.* Propeller Corrosion and Cavitation Erosion—Its Prevention by Cathodic Protection. M. G. Duff. *Corrosion Technology,* v. 5, Aug. 1958, p. 250-253.

Sources of trouble from corrosion and cathodic protection systems of various types of vessels. (R10d, T22)

715-R.* Cathodic Protection Under Present Freight Conditions. *Corrosion Technology,* v. 5, Aug. 1958, p. 254-256.

Major tanker companies find cathodic protection economical. Designs and capabilities of cathodic protection system, including spherical collared anodes, used in the deep tanks and on the hulls. (R10d, T22g)

716-R.* Reducing Cathodic Protection Costs in Tankers. L. R. Page. *Corrosion Technology,* v. 5, Aug. 1958, p. 257-259.

Improved technique and design made it possible to modify anode sizes, area-to-weight ratios and anode disposition. Epoxy resin coatings, finned anodes and attachments improved efficiency of cathodic protection in tanks. High-purity Zn anodes automatically regulate current output and are used in protecting the hull and propeller. (R10d, T22g)

717-R.* Corrosion in the Food Industry. J. W. Selby. *Food Manufacture,* v. 33, Oct. 1, 1958, p. 403-410.

Principal corrosive constituents encountered are atmospheric oxygen, organic acids, chlorides, labile sulphur and sometimes sulphur dioxide (used as a food preservative). The 18-8 Cr-Ni steels with Mo show the greatest resistance to most acid chloride conditions and will even give fair service when SO_2 is present. Corrosive behavior of Ni, Monel, Inconel and Sn analyzed. 7 ref. (R7n; SS, Ni)

718-R. Corrosion Behaviors of Plutonium and Uranium. J. T. Waber. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/699, 1958, 31 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Relatively mild attack on both Pu and U by O is accelerated by moisture. If corrosion by H_2O occurs in the absence of O, the attack is even more aggressive than if O is present. 18 ref. (R4; Pu, U)

719-R. Effects of Alloying on the Kinetics of Oxidation of Niobium. W. D. Klopp, C. T. Sims and R. I. Jaffee. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/712. 1958, 39 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Kinetics of the Cb-O and Cb-air reactions investigated at 400-550° C. and 600-1200° C. respectively. Effects of binary additions of V, Mo, Cr, Ti, Zr and W on the Cb-air reaction investigated at 1000 and 1200° C. Weight-gain data were obtained for Cb ternary alloys in air at 600, 800 and 1000° C. 18 ref. (R1h, 2-60; Cb-b)

720-R. High Temperature Aqueous Corrosion of Aluminum Alloys. J. E. Draley, C. R. Breden, W. E. Ruther and N. R. Grant. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/714, 1958, 18 p. Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Corrosion of alloy X8001 in distilled water at various temperatures. From 150 through 290° C., a reasonably good straight line represents the log of the corrosion rate as a function of the reciprocal of the absolute temperature. 8 ref. (R4a, 2-62; Al-b)

721-R.* (English.) Oxidation Rate of Steel and Cast Iron in a Steam Atmosphere. P. Szeki. *Acta Technica,* v. 22, no. 1-2, 1958, p. 129-134.

Based on experiments with cast iron (3.28% C, 0.33% Mn, 1.74% Si, 0.10% S, 0.29% P) exposed to a steam atmosphere at 750° C. and with mild low-carbon steel (0.11 C,

0.39 Mn, 0.23 Si, 0.031 S, 0.031 P) in steam at 650° C.; formulas for the oxidation rate constant are found for each of both materials thought useful in oxide coating. 7 ref. (R4d; Cl-b, CN-g)

722-R.* (German.) **Behavior of Oxide Layers on Metals.** L. Vlasakova. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 536-538.

Effect of the properties of the films—absorption, emissivity, conductivity and diffusion—on the kinetics of surface reactions and corrosion. 4 ref. (R1a)

723-R. Corrosion in Water Engineering. A. W. Neal. *Corrosion Prevention & Control,* v. 5, Oct. 1958, p. 46-48.

Comparison of protective coatings on steel pipes, boilers and cisterns. (R4, R10, T26q; ST, CI, 4-60)

724-R. Study of the Passivity of Metals in Inhibitor Solutions, Using Radioactive Tracers. Pt. 1. Action of Neutral Chromates on Iron and Steel. D. M. Brasher and A. H. Kingsbury. *Faraday Society, Transactions,* v. 54, Aug. 1958.

Using potassium chromate labelled with Cr51, during immersion of steel in chromate solution, logarithmic growth of an oxide film, containing chromic and iron oxides, is seen to proceed in a manner similar to that of oxide film growth in air. 20 ref. (R10c, 1-59; ST)

725-R. Optical Measurement of Film Growth on Silicon and Germanium Surfaces in Room Air. R. J. Archer. *Electrochemical Society,* Abstract no. 70, May 1957, p. 153-161.

Ellipticity of polarized light reflected from the surfaces was measured to obtain film growth rates. (R2r; Ge, Si, 14-61)

726-R. Have You Tried Titanium to Check Corrosion? *Petroleum Engineer,* v. 30, Sept. 1958, p. C-12.

Typical chemical plant applications. (R-general, T29; Ti, 17-57)

727-R. Some Basic Problems of the Formation and Adherence of Scale on Iron. H. Engell and F. Wever. *Acta Metallurgica,* no. 5, Dec. 1957, p. 695-702. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. 58-1360.)

INSPECTION and CONTROL

1-S. Procedures for Chemical Analysis of 7% Uranium-Zircaloy. J. Rynasiewicz. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-JR-6, May 31, 1956, 20 p. (CMA)

Procedures for determining U (titrimetrically); Fe (volumetrically); Ni (colorimetrically); Cr (colorimetrically); Sn (polarographically); and N (micro-Kjeldahl). (S11; U, Zr)

2-S. Non-Destructive Tests on 2½-In. Titanium Pipe and Housing for Centrifugual Pump. J. P. Hammond and T. M. Kegley. *U. S. Atomic Energy Commission,* CF-56-10-27, Oct. 4, 1956, 4 p. (CMA)

Titanium pipe considered off grade was evaluated for soundness and surface quality by ultrasonic and radiographic techniques and metallographic examination. Surface defects were found but the pipe (and the housing fabricated from it) were reported otherwise sound. (S13; Ti)

3-S. Determination of Zirconium in Plutonium by Ion Exchange and Spectrography. Roy Ko. Hanford Works. *U. S. Atomic Energy Commission,* HW-51831, Aug. 5, 1957, 9 p. (CMA)

Impurity amount of zirconium can be separated from plutonium by anion exchange of the plutonium nitrate complex. The combined effluent and wash solution is analyzed for zirconium by graphite spark excitation, using cobalt as the external standard. 14 ref. (S11f, S11k; Pu, Zr)

4-S. New Spectrophotometric Determination of Titanium With Sodium Alizarinsulfonate. Hidehiro Goto, Yachiyo Kakita and Michiko Namiki. *Tohoku University, Research Institutes, Science Reports, Series A (Physics, Chemistry and Metallurgy),* v. 9, Aug. 1957, p. 245-252. (CMA)

Method is based on the green color resulting when titanium is introduced into a solution of sodium alizarinsulphonate and $SnCl_2$ in HCl solution. 4 ref. (S11a; Ti)

5-S. (Russian.) **Surface Inspection of Wire Rod by the Magnetic Suspension Method.** E. I. Andreev and V. N. Gulyakova. *Stal',* v. 17, May 1957, p. 456-457.

Method consists of placing the sample in a bath holding magnetic particles in suspension which deposit along imperfections on the surface of the magnetized sample. Rod within the range of 6-8 mm. can be inspected with complete satisfaction as to quality and efficiency. (S13j; ST, 4-55)

6-S. Determination of Antimony in Cast Iron. R. C. Rooney. *Analyst,* v. 82, Sept. 1957, p. 619-623.

Sample is dissolved in nitric acid under controlled conditions. 12 ref. (S11j; CI, *SG*)

7-S. Volumetric Determination of Tin in Titanium and Its Alloys. H. J. G. Challis and J. T. Jones. *Analyst,* v. 82, Oct. 1957, p. 658-663. (CMA)

5 ref. (S11j; *Sn,* Ti)

8-S. Determination of Boron in Titanium Alloys by Ion Exchange Method. E. G. Newstead and J. E. Gulbierz. *Analytical Chemistry,* v. 29, Nov. 1957, p. 1673-1674. (CMA)

12 ref. (S11f; *B,* Ti)

9-S. Uses of Statistical Methods for Ultrasonic Inspection Problems. M. J. Bratt. *Nondestructive Testing,* v. 15, Sept.-Oct. 1957, p. 282-287.

Basic concepts of statistics and use of statistical methods in analyzing data in typical problems. (S13g, S12)

10-S. Relative Advantage and Limitation of Nondestructive Testing Methods. L. vanOuwerkerk. *Nondestructive Testing,* v. 15, Sept-Oct. 1957, p. 298-312.

Includes radiography, ultrasonics and magnetic particle penetrant methods. (S13)

11-S. (German.) **Determination of Silicon in Steel and Cast Iron Wire. New Filter and Combustion Sleeves.** Gisela Lingelbach. *Giessereitechnik,* v. 3, June 1957, p. 133-134.

(S11, ST, CI, *Si,* 4-61)

12-S. (German.) **Crankshaft Strength.** A. Theodor Wuppermann. *Stahl und Eisen,* v. 77, Aug. 22, 1957, p. 1117-1122.

Longitudinal surface defects are detected by nondestructive tests. 4 ref. (S13, T21c)

13-S. (German.) **Additional Data on the Gas Content of Lead.** Wilhelm Hofmann and Jürgen Maatsch. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 10, July 1957, p. 313-317.

Degassing of lead under vacuum resulted in gas contents of 1/10 NM1/100 g. melted material. The gas consisted mainly of steam and CO_2, which are formed by a reaction of carbon and hydrogen penetrating from the outside and oxygen in the melt. 14 ref. (S11r, E25s; Pb)

14-S. Micro Volumetric Determination of Uranium With Application to Bismuth Base Alloy Analysis. G. W. C. Milner and G. A. Barnett. *Analytica Chimica Acta,* v. 17, Aug. 1957, p. 220-225.

Macro volumetric method for the determination of U by titration against standard ceric sulphate after reduction on a Pb column has been successfully applied on the micro scale to analysis of Bi-base alloys containing U in concentrations from 0.005 to 0.1% by weight. 5 ref. (S11d; *U,* Bi)

15-S. Ion Exchange Separations in the Anaylsis of Bismuth Base Alloys. Pt. 1. Binary Alloys With Uranium and Thorium. G. W. C. Milner and J. W. Edwards. *Analytica Chimica Acta,* v. 17, Aug. 1957, p. 259-263.

Separation and reduction techniques are supplemented by volumetric and absorptiometric procedures for determination of U (0.001-10%) + Th (0.05-10%) in binary mixtures with Bi. 7 ref. (S11f; U, Th, *Bi*)

16-S. Titanium Arc Furnace Operation Controlled by Atomic Radiations. *Industrial Heating,* v. 24, Oct. 1957, p. 2018, 2026. (CMA)

Gamma rays are being used to detect and control the level of molten titanium in a "cold hearth" arc furnace; a needle of Co-60 is the source of gamma-rays which pass through the ingot. (S18q, W18s; Ti, *Co*)

17-S. Radioisotopes: Use Them on Tough Problems. C. M. Crompton. *Iron Age,* v. 180, Oct. 17, 1957, p. 111-114.

Radioisotopes find application in sheet, strip and film gaging, flaw detection and basic research. (S13, S14, A9; 14-63)

18-S. Application of Static Switching in the Steel Industry. D. L. Pierce. *Iron and Steel Engineer,* v. 34, Nov. 1957, p. 113-125.

Instrumentation and control in steel mills. (S16, S18, W23; ST)

19-S.* SNT Airframe Committee Report on Reproducibility of Ultrasonic Inspection Test Results. Z. J. Varney and R. E. Kleint. *Nondestructive Testing,* v. 15, Sept-Oct. 1957, p. 290-292.

Results of ultrasonic detection and evaluation tests for defects in 7075 Al alloy plate performed by 27 different organizations. (S13g; Al)

20-S. Status Report on Core-3 Hafnium Control Rods. E. D. Baugh and H. B. Hunter. Westinghouse Atomic Power Division, *U. S. Atomic Energy Commission,* WAPD-FEM-60, Feb. 11, 1955, 9 p. (CMA)

Control rods were fabricated of Hf ingots and studied to determine the source and result of contamination. Welding was the source of about 750 ppm. w; Ni is a minor impurity. Contaminated platelets are more likely to crack in cold rolling. (S13, T11j; Hf)

21-S. Determination of Tin in Zirconium-Base Alloys. T. C. Bryson, et al. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-CTA(GLA)-371, Apr. 18, 1957, 4 p. (CMA)

(S11j; *Sn,* Zr)

22-S. Leak Prevention—Through In-Process Leak Detection. Richard P. Turner. *Welding Journal,* v. 36, Dec. 1957, p. 1167-1171.

Use of fluorescent penetrants and fluorescent additives in tank and vessel inspection. (S13, T26q)

23-S. (Pamphlet.) **Steel Products Manual: Steel Tubular Products.** 155

p. Sept. 1957. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Dimensions, tolerances, chemical analysis, nomenclature and sampling of steel tubing, stainless steel tubing and steel pipe.
(S22; ST, SS, 4-60)

24-S. (Pamphlet.) **Steel Products Manual: Hot Rolled Carbon Steel Strip.** 26 p. Oct. 1957. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Dimensions, tolerances, chemical analysis, nomenclature and sampling of hot rolled carbon steel strip.
(S22; CN, 4-53, 1-66)

25-S. (Pamphlet.) **Steel Products Manual: Cold Rolled Carbon Steel Strip.** 27 p. Oct. 1957. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Dimensions, tolerances, chemical analysis, nomenclature and sampling of cold rolled carbon steel strip.
(S22; CN, 4-53, 1-66)

26-S. (Pamphlet.) **Steel Products Manual: Tin Mill Products.** 34 p. Oct. 1957. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Dimensions, tolerances, chemical analysis, nomenclature and sampling of tin plate, black plate, terne plate, blued plate and hollow-ware enameling stock. (S22, ST, *Sn,* 8-62, 8-66)

27-S. (Czech.) **Control and Recording of Temperatures During Pouring and Solidification of Steel.** Lubomir Smrha and Rostislav Hluzin. *Hutnické Listy,* v. 12, 1957, p. 711-714.

Good result in measuring liquids and solidifying steel temperatures obtained with Pt-Rh thermocouple in protective quartz capillary tubes; mechanical high-speed recorder used for recording temperatures.
(S16j, X9q; ST)

28-S. (Czech.) **List of Terms Connected With Spectroscopic Analysis and Their Equivalent in Czech, Russian, German, Polish, French and English.** Josef Kuba. *Hutniké Listy,* v. 12, 1957, p. 715-718.

(S11k; 11-67)

29-S. (French.) **Applications of Radioactivity in the Light Industry.** F. Rohner. *Aluminium Suisse,* v. 5, Sept. 1957, p. 174-181.

Applications of radiotracers and autoradiography. Nondestructive tests; analysis by activation. Proportional Geiger-Muller counters are more and more employed for measuring radiation.
(S19, X8, X2; Al, Mg)

30-S. (German.) **Determination of Small Amounts of Titanium in Iron Alloys and Ores After Separation of the Heavy Metals by Pyrrolidinedithiocarbamate.** Ernst Schoeffmann and Hanns Malissa. *Archiv für das Eisenhüttenwesen,* v. 28, Oct. 1957, p. 623-624. (CMA)

(S11; *Ti,* Fe)

31-S. (German.) **Rapid Photometric Determination of Titanium in Copper Alloys.** H. Wiedmann. *Metall,* v. 11, Nov. 1957, p. 942-943. (CMA)

2 ref. (S11a; Au, *Ti*)

32-S.* (German.) **Rimming Steel.** Hubert Hoff, Georg von der Dunk and Heinz Lessing. *Stahl und Eisen,* v. 77, Sept. 1957, p. 1210-1215.

Determination of the nonmetallic inclusions in steel ingots made from rimming-type, free-cutting steel.
(S13b, D9p, G17k; 2-60; ST-d)

33-S. (German.) **Automatic Testing of Billets by Magnetic and Ultrasonic Methods.** Vladimir Husarek. *Stahl und Eisen,* v. 77, Oct. 1957, p. 1483-1487.

Experimental assembly for testing steel billets simultaneously by electromagnetic and ultrasonic methods; applications in a wire rod mill; results with billets rolled from basic bessemer low-carbon steel. Design of an automatic testing assembly.
(S13g, S13h; CN-g, 4-52, 4-55)

34-S. (German.) **Spectormetric Analysis of Steel.** Gerhard Hartleif. *Stahl und Eisen,* v. 77, Oct. 1957, p. 1497-1499.

Determination of C, P, S and gases in steel; sample preparation; excitation; selection of the spectrum lines; optical stability of the apparatus; evaluation. 7 ref. (S11k; ST)

35-S. (German.) **Indirect Volumetric Determination of Molybdenum With Ethylenediamine Tetraacetic Acid.** E. Lassner and H. Schlesinger. *Zeitschrift für Analytische Chemie,* v. 158, no. 3, 1957, p. 195-198. (CMA)

4 ref. (S11j; *Mo*)

36-S. (Japanese.) **Inspection of Aluminum Slab by Supersonic Waves.** T. Morinaga and T. Takahashi. *Casting Institute of Japan, Journal,* v. 29, July 1957, p. 508-514.

Location of large blisters on rolled and annealed plate. (S13g; Al, 9-71)

37-S. (Japanese.) **Preparation of Sample for Chemical Analysis of Sponge**

Titanium. Kazukiyo Ohashi, Tsuyoshi Nakayama and Kameji Shimasaki. *Japan Analyst,* v. 6, Sept. 1957, p. 572-579. (CMA)

(S12h, S11; Ti, 6-74)

38-S. (Spanish.) **Determination of Small Amounts of Aluminum in Titanium.** M. E. Bertin and A. H. Guerrero. *Associacion Quimica Argentina, Annales,* v. 45, June 1957, p. 121-125. (CMA)

7 ref. (S11j; *Al,* Ti)

39-S. **Inspection of Electrodeposits.** N. A. Tope. *Inspection Engineer,* v. 21, July-Aug. 1957, p. 74-79.

Thickness and thickness tests; "strip and weigh" method, time of gassing tests, B.N.F. jet test method, nondestructive tests, microscopic examination. (To be continued.) (S13, S14, 8-62)

40-S.* **Use of Phytic Acid in the Analytical Chemistry of Thorium.** A. I. Ryabchikov, V. K. Belyaeva and A. N. Ermakov. *Journal of Analytical Chemistry of the U.S.S.R.,* v. 11, Nov-Dec. 1956, p. 705-714. (Translated by Consultants Bureau, Inc.)

Technique for quantitative determination of Th in monazite concentrates based on precipitations of Th from 6 *N* (by volume) nitric acid in the presence of oxalic acid. 56 ref. (S11j; Th)

41-S.* **Organic Coprecipitants (Collectors). Pt. 7. Coprecipitation of Bismuth. Determination of Small Amounts of Bismuth in Alloys Based on Cr and Ni.** V. I. Kuznetsov and L. I. Papushina. *Journal of Analytical Chemistry of the U.S.S.R.,* v. 11, Nov-Dec. 1956, p. 733-735. (Translatetd by Consultants Bureau, Inc.)

During precipitation of the sparingly soluble iodide of methyl violet, quantitative removal of any Bi contained in the solution, down to dilutions of $1{:}1{\cdot}10^8$, from the precipitate, occurs. Ni and Cr are not attracted into the precipitate. Method for determining small amounts of Bi in Cr-Ni steels, based on separation of Bi by coprecipitation with methyl violet iodide, with subsequent colorimetric determination as the iodide complex. 6 ref. (S11j; AY, *Bi*)

42-S.* **Bismuthate Method for Determining Chromium in Steels Not Containing Vanadium.** P. F. Agafonov. *Journal of Analytical Chemistry of the U.S.S.R.,* v. 11, Nov-Dec. 1956, p. 811-812. (Translated by Consultants Bureau, Inc.)

Simple method for rapid determination of Cr in steels via oxidation of Cr in sulphuric acid media; excess Bi is reduced directly in solution with potassium (sodium) chlorides. (S11; AY, *Cr*)

43-S. **Standards for Aluminum.** A. W. Halford. *Standards Engineering,* v. 9, Aug-Sept. 1957, p. 4-6.

Development of Al alloy designations; national and international standardization of light metal specifications; pernicious effect of proprietary customer specifications. (S22; Al)

44-S. **Determination of Nitrogen in Zirconium.** E. L. Shirley and G. R. Smith. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-ELS-4, June 6, 1956, 5 p. (CMA)

(S11a; *N,* Zr)

45-S. **Analysis of Samarium Oxide in 304 Stainless Steel-Samarium Oxide Cermets.** V. F. Consalvo and J. Rynasiewicz. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-VFC-1, June 14, 1956, 6 p. (CMA)

(S11; *Sm,* SS; 6-70)

46-S. **Determination of Nitrogen in Zirconium and Zirconium-Base Alloys.** G. J. Harter, A. W. Perrine and J. F. Rodgers. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-CTA(GLA)-170, Apr. 18, 1957, 6 p. (CMA)

(S11a; *N,* Zr)

47-S. **A Spectrophotometric Investigation of Vanadium (V) Species in Alkaline Solutions.** Leonard Newman, et al. National Lead Co. *U. S. Atomic Energy Commission,* WIN-55, June 10, 1957, 41 p. (CMA)

Fundamental quantitative data on the mechanism by which V interacts with U in alkaline carbonate solutions. Such information is important for an understanding of the precipitation of U and V from leach liquor. 34 ref. (S11k, C19n; U, V)

48-S. (German.) **Determination of Antimony in Ores and Concentrates.** J. Dolezal and P. Beran. *Czechoslovak Chemical Communication, Collection,* v. 22, June 1957, p. 727-731.

7 ref. (S11m; Sb, *Cu, Bi,* RM-n)

49-S. (German.) **Standardization of Thin Plates.** G. Oehler. *Feinwerk Technik,* v. 61, Aug. 1957, p. 280-286.

Various proposals for changes in German standards for thin plates. (S22, 4-53)

50-S. (German.) **Rapid Method for Determination of Cr_2O_3 and SiO_2 in Chromium Ores.** H. Sövegjatro. *Radex Rundschau,* no. 4, July 1957, p. 668.

(S11b; Cr, RM-n)

51-S. (German.) **Relation Between Specific Weight and Chemical Composition of Chromium Ores.** F. Trojer. *Radex Rundschau,* no. 4, July 1957, p. 671-672.

(S11b; Cr, RM-n)

52-S. (German.) **Determination of Gases in Metals With Special Consideration of Hydrogen in Aluminum.** F. Rabner. *Schweizer Archiv,* v. 23, Aug. 1957, p. 243-248.

Historical and modern methods and equipment. 32 ref. (S11r; Al, *H*)

53-S. (German.) **Measurement of Mechanical Tension in an Elastic Field by Means of the Magneto-Elastic Effect.** Gotthold Bubenzer. *VDI Zeitschrift,* v. 99, Sept. 1, 1957, p. 1215-1217.

Testing of a continuously welded rail. (S13h, T23q; ST)

54-S. (German.) **Inspection With X-Ray Image Intensifier.** Gerhard Lang. *VDI Zeitschrift,* v. 99, Sept. 1, 1957, p. 1227-1231.

Examination of very thick workpieces is possible where regular luminescent screen is not applicable. Picture brightness during X-ray of steel sheets is sufficient for a TV telecast. 4 ref. (S13e, X8g; ST)

55-S. (Japanese.) **Photometric Determination of Small Amounts of Nickel in Ores.** Kiyoshi Isono. *Japan Analyst,* v. 6, Sept. 1957, p. 557-561.

(S11a; Ni, RM-n)

56-S.* (Spanish.) **Determination of Small Amounts of Germanium.** A. Fernandez Segura, A. A. Garmendia and E. L. Pella. *Asociacion Quimica de la Argentina, Anales,* v. 45, June 1957, p. 126-135.

Method for quantitative determination of Ge in the range between 10 and 30 gammas per liter, in an approximate 2*N* zinc sulphate solution. 13 ref. (S11; Ge)

57-S.* (Portuguese.) **Study on the Quality of Steel Elevator Cables.** Karl Ehrenberg. *ABM, Associacao Brasileira de Metais, Boletim,* v. 13, July 1957, p. 267-282.

Studies made at plant of Elevadores Atlas, S. A., on samples of cable supplied by European, North American and Brazilian manufacturers. "Life tests" were carried out in test tower under simulated operating conditions to determine characteristics necessary to satisfactory length of service. (S21, T7g; ST)

58-S.* **Ultrasonic Testing of Aluminum Alloys.** William L. Fink. *ASTM Bulletin,* no. 226, Dec. 1957, p. 36-42.

Acceptance standards should be based on a zoning principle that requires the most rigid standards for the extremely small critical regions in which there are high stress concentrations and in which the plane of the discontinuity lies perpendicular to the direction of loading. (S13g; Al)

59-S. **An Investigation of a Method for the Combined Determination of Niobium and Tantalum in Steel.** *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 341-343.

Procedure provides for the presence of W, Ti and Mo and by a slight adjustment of conditions, the W precipitate could be made quantitative and simultaneous determination made. (S19j; ST, *Cb, Ta*)

60-S. (Czech.) **Standardization of Metallurgical Installations and Construction.** Josef Kopechy. *Hutnické Listy,* v. 12, Oct. 1957, p. 865-877.

4 ref. (S22)

61-S. (Czech.) **Furnace Standardization.** Rudolf Bures. *Hutnické Listy,* v. 12, Oct. 1957, p. 883-887.

Standards for oil and gas-fired furnaces. (S22, 1-55)

62-S. (English.) **Spectrographic Determination of Microamounts of Arsenic, Antimony, Bismuth, Tin and Lead.** Yu Yokoyama. *Tohoku University, Science Reports of the Research Institutes,* v. 9, Oct. 1957, p. 419-425.

3 ref. (S11k; As, Sb, Bi, Sn, Pb)

63-S. (German.) **Acceptance Testing of Materials.** Rudolf Schinn. *Stahl und Eisen,* v. 77, Nov. 14, 1957, p. 1674-1686.

Relation between specification, testing and acceptance. Description of tests. 16 ref. (S22, S13; ST)

64-S. (German.) **Microscopic Examination of Impregnated Porous Minerals.** Josef Cloth. *Stahl und Eisen,* v. 77, Nov. 14, 1957, p. 1691-1692.

New microchemical method for rapid analysis of alloys containing these elements; experimental determination and theoretical calculation of curves of distribution in countercurrent; effect of pH and concentration of coefficients of distribution. By varying the concentration of hydrogen ions it was possible to determine coefficients of distribution of the dithizone-treated metals studied and to establish the optimum separation that occurs around pH 4.54. 10 ref. (S11d; Bi, Pb, Th)

168-S. (French.) **Rapid Determination of Lead in the Sulphate State in Antifriction Alloys.** E. Garate and T. Garate. *Chimie Analytique,* v. 40, Jan. 1958, p. 7-10.

Simple, accurate method requiring no previous separation of other components; can be used equally well on Sb-Pb alloys, tin solders and bronzes; uses diluted nitric and hydrofluoric acids. 10 ref. (S11j, S11k; Pb)

169-S. (French.) **New Method for Analyzing Copper Alloys.** M. Kuhn.

Chimie Analytique, v. 49, Jan. 1958, p. 11-19.

Method based on complete dissolution of bronzes in nitrofluoboric medium has been tested on tin bronzes, has wide application. (To be continued.) (S11j; Cu-s)

170-S. (German.) **Bearing Material Testing. Pt. 1.** R. Weber. *Metall*, v. 12, Feb. 1958, p. 96-103.

Physical, mechanical ("volumen") and surface properties. Testing machines and methods; evaluation of materials on the basis of their volume. (S14, Q-general; SGA-c)

171-S (German.) **Turbidimetric Determination of the Tin Content in High-Purity Zinc and Zinc Alloys.** H. Pohl. *Metall*, v. 12, Feb. 1958, p. 103-105.

(S11j; Zn, *Sn*)

172-S. (Japanese.) **Photometric Determination of Small Amounts of Nickel in Ores.** Hiyoshi Isono. *Japan Analyst*, v. 6, Sept. 1957, p. 557-561.

Improvements on the E. B. Sandell method of colorimetric determination of Ni in chloroform.
(S11a; Ni, RM-n)

179-S.* (German.) **Thermo-Electric Measurement of Openhearth Furnace Roof Temperatures.** H. J. Kirschning, E. Hochstrate and H. Rodrian. *Archiv für das Eisenhüttenwesen*, v. 28, Oct. 1957, p. 611-614. (Translation in *Iron and Coal Trades Review*, v. 176, Jan. 1958, p. 42-44.)

The main cause of difficulties in measurement of furnace temperatures lies in the diffusion of carbon into the protective ceramic sleeves around the Pt-Rh thermocouples and subsequent changes in structure and temperature resistance. Al_2O_3, MgO, $Al_2O_3 \cdot BeO$ and ZrO_2 are compared as sleeve material; melting point, thermoconductivity, sensitivity to temperature fluctuations and corrosion resistance are given. BeO proved best for permanent and economic sleeve material. 8 ref. (S16b, W18r, X9q; Pt, Rh, RM-h)

180-S. (German.) **Use of Piacryl "SH" for Surface Examination.** S. Sohrmann. *Fertigungstechnik*, v. 8, Jan. 1958, p. 25-28.

Application possibility of a synthetic material, Piacryl "SH" pink, designed originally for dentistry. Method of application and results of experiments. 9 ref. (S15d)

181-S. (German.) **Separation of Rare Earths. Pt. 5. With Cation Exchangers.** Leopold Wolf and Joachim Massonne. *Journal für Praktische,* v. 5, Oct. 1957, p. 21-33.

9 ref. (S13g, T11g; U-b)

194-S.* (Czech.) **Ultrasonic Testing of Turbogenerator Rotors.** Karel Slonek. *Hutnické Listy,* v. 13, Jan. 1958, p. 33-37.

Manual ultrasonic control for determination of important defects in rotors. Of 53 rotors tested, the ultrasonic finding was verified with eight rotors by means of cross-sections. Results show the ultrasonic method to be suitable for homogeneity control of turbine material and generator rotors. 8 ref. (S13g, T7h)

195-S.* (French.) **Contribution to the Improvement of Gamma-Ray Techniques.** P. Ruault and P. Rath. *Revue de Metallurgie,* v. 55, Jan. 1958, p. 39-52.

Gamma-ray inspection can be improved by reduction of exposure time, use of overdevelopment, better use of emulsions, reinforcement with lead screens, quality control of radiographic image. (S13e)

196-S.* (German.) **Control Techniques and Their Application in a Continuous Wiredrawing Mill.** H. Cordes. *Draht,* v. 9, Feb. 1958, p. 39-43.

Types of control; examples of application, control as a means of automatizing production. (S18, F28, 1-61)

197-S. (German.) **Bright Steel Surface.** Otto Andrien. *Industrie-Anzeiger,* v. 79, Oct. 11, 1957, p. 1235-1237.

Determination of flaws in bright steel surfaces. (S15; ST)

198-S. (German.) **Reduction of Testing Costs.** Hans Schmidt. *Werkstatt und Betrieb,* v. 91, Feb. 1958, p. 61-65.

Description and use of multiple sample testing outfits. 5 ref. (S12h, X-general)

199-S.* **X-Rays Speed Inspection of Raw Stock.** Vern W. Palen. *American Machinist,* v. 102, Feb. 24, 1958, p. 100-101.

Analysis of raw steel bar stock done more accurately and five times faster by X-ray diffraction than by chemical analysis. Specimens are cut (½ in. long), flattened and polished, and placed in X-ray spectrograph. It operates and stops automatically, measuring the time a fixed number of pulses have been reflected. (S11p; ST, 4-55)

200-S. (English.) **Segregation in Castings by Spectrographic Analysis. Pt. 4. Segregation in Copper Alloy Castings; Segregation in Aluminum Alloy Castings.** Kazuo Yasuda. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 47-53.

Local spectrographic analysis used for determining segregation in Cu-Sn or Cu-Zr alloys cast in water-cooled metal or green sand molds. Method also used on Al-Cu, Al-Mg and Al-Si alloys cooled at various speeds. (S13d, S11c; Al-b, Cu-b, 5-60, 9-69)

201-S. (English.) **Mass Spectrometric Determination of Gases in Cast Iron. Apparatus and Determination of Nitrogen.** Eiichi Kato. *Waseda University, Castings Research Laboratory, Report,* no. 8, Nov. 1957, p. 81-84.

Vacuum fusion apparatus and procedure utilizing mass spectrometer for determining gases in cast iron. Determination of nitrogen content and comparison with that obtained by chemical methods. (S11c; CI, *O, N*)

202-S. (French.) **New Apparatus for Nondestructive Continuous Metal Control.** L. Beaujard and V. Husarek. *Metaux-Corrosion-Industries,* v. 32, Dec. 1957, p. 459-468.

Electromagnetic and ultrasonic methods and applications in the iron and steel industry. (S13h, S13g, 1-52)

203-S. (Book—French.) **Nondestructive Methods for the Study and Control of Materials.** J. L. Pignet. 280 p. 1957. Revue Optique, 3 et 5, Blvd. Pasteur, Paris 15, France.

Internal and surface examination and testing techniques, their applications, geometric and physical laws utilized, equipment employed, interpretation of results. Classic and conventional methods plus newer techniques involving use of gamma and X-rays, ultrasonics, liquid penetration, magnetic particle inspection, etc. Examples of industrial applications. (S13, S14, S15)

204-S.* **Steel Heat Treatment Quality Control. Pt. 1. The Quality Control Plan.** Konrad Kornfeld. *Canadian Metalworking,* v. 21, Mar. 1958, p. 24, 26, 28.

Consideration of material quality, furnace temperatures, quenching and supervision of personnel to maintain standards of a steel product. (S-general; J-general; ST)

205-S.* **Quality Control in Cupola Melting.** R. A. Short. *Canadian Metalworking,* v. 21, Mar. 1958, p. 30, 32, 34, 36, 38.

Statistical quality control records for each day establishes a trend which can be used to determine control limits in iron smelting. (S12, E10a)

206-S.* **Automatic Gauge Control in Rolling Mills.** R. B. Sims. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 289-302.

Theoretical background of automatic gage control. Installations of the Davy-United B.I.S.R.A. system on reversing and tandem mills, and some other types of control operated from thickness gages, and maintaining strip thickness by varying either the position of the mill screws or the applied strip tension. Economics of the controller. 15 ref. (S14, X20c, W23p, 1-52)

207-S.* **Accuracy of Strip-Thickness Measurement by Beta and**

Gamma Absorption. E. B. Bell. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 303-309.

Fundamental and operational accuracy limitations, with particular reference to statistical variations, detector sensitivity variations, electronic drift, movement of absorber and variation of these errors over the range of the instruments. 4 ref. (S14e, 4-53)

208-S.* Measurement, Inspection, and Automatic Process Control in the Steel-Strip Finishing and Tinplate Industry. S. S. Carlisle and J. H. Wilson. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 310-315.

Nondestructive inspection techniques developed for continuous steel strip processing lines: measurement of coating thickness by X-ray fluorescence, measurement of strip width and thickness and detection of pinholes and lamination. Need for a suitable method for continuous and objective measurement of tinplate surface quality. 11 ref. (S13, S14; ST, *Sn,* 4-53)

209-S. Inspection of Tubes for Flaws and Variations in Thickness. J. B. C. Robinson. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 316-322.

Fundamental aspects of eddy-current inspection with special reference to a commercial instrument—the "Introview"—and the probe design. Metallurgical and physical conditions of tubing as they affect eddy-current techniques. Use of eddy currents for inspecting condenser tubes after a period of service and for detecting flaws in tubes during production. 11 ref. (S13h, S14h; 9-71, 4-60)

210-S. Basic Guides to Steel Quality. *Steel,* v. 142, Apr. 28, 1958, p. 106, 109.

Use of control charts, frequency distribution and sampling to assure valve steel quality. (S12; ST)

211-S. Spectrographic Determination of Uranium in Ores and the Products Obtained by Treatment of These Ores. N. G. Morozova. *Journal of Analytical Chemistry of the USSR,* v. 12, no. 2, 1957, p. 183-190. (Translation by Consultants Bureau, Inc.)

S^{35}, Tl^{204}, Sr + Y^{90}, and Ru + Rh^{106} were used to determine thickness ranges of Sn and Pb coatings. Thickness of the base material cannot be greater than the so-called final thickness. For measurement of currently manufactured Sn and Pb coatings, Tl^{204} is best among the isotopes available. 7 ref. (S14e, 1-59; *Pb, Sn,* 8)

253-S. (French.) **Automatic Factory Inspection of Soft Steel Billets by Electromagnetic and Ultrasonic Methods.** V. Husarek and L. Beaujard. *Publications de l'Institut de Recherches de la Sidérurgie,* Series A, no. 132, May 1957.

To insure uninterrupted movement along conveyer to rolling mill, defective billets must be eliminated. Electromagnetic and ultrasonic inspection methods can be applied for more accurate knowledge of qualities of first choice and lower grade lots, decrease in visual inspection costs, elimination of incidents in rolling due to defects, and quality improvement of finished product. These benefits largely offset installation and operation costs of the inspection systems. (S13g, S13h; ST, 5-59)

254-S.* (German.) **Ultrasonic Testing of Aluminum Workpieces.** W. Boehme. *Aluminium,* v. 34, Apr. 1958, p. 200-205.

Convenient and robust testing rig for scanning defects inside workpieces, surface defects and testing of joints. Ultrasonic testing has advantage that mechanical millimeter waves can penetrate much further than high-frequency electromagnetic waves and thus detect finer discontinuities than with X-rays and gamma rays. 7 ref. Conditions affecting the electrolytic deposition of micro-amounts of lead as peroxide in Cu-base alloys, particularly brass. 5 ref. (S11g, Cu-b, *Pb*)

271-S. **The Spectrophotometric Determination of Nickel in Copper-Nickel Alloys.** G. R. Sutcliffe and D. M. Peake. *Analyst,* v. 83, Mar. 1958, p. 122-125.

The optical density of the sample solution in a nitric-phosphoric acid medium is measured at 3950 Å, where absorption is due almost entirely to Ni. A similar measurement is made on the same solution at 4900 Å, where neither Cu nor Ni absorb, and this permits a background correction to be made. Method applied to copper alloys with Ni content from about 1.5 to 30%; a single determination can be completed in about 30 min., as opposed to 3 hr. by gravimetric procedure. (S11k; *Ni,* Cu-b)

272-S. Volumetric Determination of Uranium in Presence of Iron. M. W. Desai and T. K. S. Murthy. *Analyst,* v. 83, Mar. 1958, p. 126-129.

Oxidation of reduced uranium with ferric sulphate and titration of the excess of ferric iron iodimetrically. Osmium tetroxide is a suitable catalyst. 11 ref. (S11j; *Fe,* U)

273-S. A Spectrochemical Solution Method for the Determination of Copper, Cobalt and Iron in Copper and Cobalt Concentrates. G. L. Mason and Z. De Beer. *Analyst,* v. 83, Mar. 1958, p. 129-135.

A solution method of spectrochemical analysis of Cu and Fe in Cu and Co concentrates over the range 5.0 to 40.0%, and 0.2 to 6.0% Co. Results show good agreement with chemical analyses, but reproducibility varies, according to the element and its concentration. The time for one analysis is 1 hr., and 20 samples can be analyzed. 10 ref. (S11k; Cu, Fe, Co)

274-S. Analysis of Rare Earth Mixtures by a Recording Spectrophotometer. D. C. Stewart and Dorothy Kato. *Analytical Chemistry,* v. 30, Feb. 1958, p. 164-172.

Multiple tracing light absorption curves of the rare earth chlorides in solution (except lanthanum, promethium and lutecium), taken with the Beckman DK recording spectrophotometer, permit direct evaluation of interferences. 9 ref. (S11a; EG-g)

347-S.* **Should Ultrasonic Inspection Be Used to Augment Radiography in the Inspection of Weldments in High-Pressure Piping.** R. L. Steele. Digest from ASME Annual Meeting, Paper 57-A-195, Oct. 1, 1958. *Mechanical Engineering*, v. 80, Mar. 1958, p. 111-112.

Root cracks cannot be detected satisfactorily by radiography even though a radiograph of the root pass is made. Ultrasonic inspection locates the crack positively. Ultrasonic inspection of field welds is also satisfactory. A possible crack was detected, which was very small, that was in no way indicated on the radiograph of the same joint. (S13g, S13e; 7-51)

348-S.* Composite Procedure for the Determination of Mo, Ni, Mn, Fe, Cr, Sn, V and N in Titanium Alloys. George Norwitz and Maurice Codell. *Metallurgia,* v. 57, May 1958, p. 261-267, 269-270.

Nickel is determined colorimetrically or gravimetrically with dimethylglyoxime; Mn is determined by the periodate colorimetric method, or by titration with arsenite; Fe is determined colorimetrically or by titration; Cr is determined colorimetrically with diphenylcarbazide, or by titration with ferrous sulphate; nitrogen is determined volumetrically. 40 ref. Method of detecting laminations in steel sheet based on the distortion they cause in the flow pattern of an electric current through the sheet. Direct current is passed through the sheet between two contacts on opposing faces while the potential difference between two adjacent contacts is measured. This potential difference is very small in sound material but rises sharply if a lamination is present.
(S13c; ST, 4-53)

390-S. Government Specifications for Aluminum. *Design News,* v. 13, Apr. 14, 1958, p. 152.
Most frequently used Federal and U. S. military specifications and their nearest corresponding ASTM, SAE and AMS numbers, together with chemical analysis and specified forms. (S22; Al-b, 15-74)

391-S.* Cutting Costs Through Quality Control. Kenneth M. Smith. *Foundry,* v. 86, June 1958, p. 65-69.
Cost-saving advantages in a control program which measures statistically the influence of each sort of casting defect on the average of all jobs of a given type.

10 ref. (S11c, Bi, U, Ca, Zr)

396-S.* Nondestructive Testing Applied to Railroad Materials and Equip-

ment. A. S. Pedrick. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 21-35.

Magnetic particle inspection, Zyglo fluorescent penetrant inspection, ultrasonic reflectoscope inspection and radiography applied to the quality control of materials and inspection of parts. (S13)

397-S.* Nondestructive Testing of Uranium. Gerold H. Tenney. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 36-48.

Uranium ranging in thickness from a few mils up to about 2½ in. has been radiographed successfully, using sources of different energies. Typical exposure charts, respective film-screen combinations, the use of vacuum cassettes and the problem of shielding against object and room scatter. Use of radiation gages to measure the uniformity of mass per unit area and the application of ultrasonics. 8 ref. (S13e; U)

398-S.* Development of Techniques for the Detection of Cracks in Small Cylindrical Specimens by Reluctance Methods. Eugene Roffman. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 49-54.

Three-coil reluctance test method, two magnetic loops passing through a test specimen which induce voltages in the detector coils. If no flaw exists, the reluctance of each magnetic loop is equal, resulting in a minimum signal at the output terminals. Tests on high-carbon heat-treated toolsteel specimens yielded no ambiguous results. (S13h; TS, 9-72)

399-S.* Ultrasonic Inspection of Aircraft Forgings. Alex Barath. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 71-78.

Automatic equipment facilitates inspection of flat stock and regular shapes, while in most cases die forgings, because of geometry and grain flow, can best be inspected using a hand scanner and a hand-operated carriage. (S13g; 4-51)

400-S. An Ultrasonic Technique for Non-Destructive Evaluation of Metal-to-Metal Adhesive Bonds. James S. Arnold. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 79-88.

System loss (sonic energy absorption) can be related to bond quality. The relationship is sufficiently close to permit the use of loss observations as a basis for nondestructive bond evaluation. Apparatus for studying this relationship has been constructed. (S13g, K12, 7-59)

401-S.* Nondestructive Testing of Bonded Metal Sandwich Structures. Richard E. Anderson. Paper from "Symposium on Nondestructive Testing", ASTM STP No. 213, p. 89-99.

Test sandwich panels were 0.004-in. gage foil, 0.25 in. cell diameter aluminum-honeycomb sandwiched between two 0.051 by 10 by 10-in. clad Al facing sheets. Optimum frequency for the ultrasonic examination of metal-honeycomb sandwich specimens was 5 Mc. (S13g; Al, 8-66)

Plutonium determined by counting the alpha sources prepared by evaporating small aliquots of solutions prepared from binary alloys of Pu with Pb, Sn or Bi and of tertiary alloys of Pu and Bi with Pb or Sn. (S11j; *Pu*, Pb, Sn, Bi)

435-S.* The Semi-Quantitative Determination of Traces of Sodium, Potassium and Magnesium in Bismuth and Bismuth-Uranium Alloys. R. J. Webb. *United Kingdom Atomic Energy Authority*, AERE C/R 2116, 1958, 7 p.
The Bi or Bi-U alloy is converted to oxide and excited in the d-c arc under standardized conditions. A medium quartz spectrograph is used for recording the spectra which are evaluated by visual comparison with spectra of synthesized samples containing known concentrations of Na, K and Mg. (S11k; Bi, U, *Na, K, Mg*)

436-S. Analysis of Thorium-Boron and Uranium-Boron Alloys. G. A. Barnett and G. W. C. Milner. *United Kingdom Atomic Energy Authority Research Group* AERE C/R 2307, 1958, 13 p.
11 ref. (S11j; Th-b, *B*, U-b)

437-S. Radiometric Determination of Uranium in Ores. LaMar G. Evans and Carl Rampacek. *U. S. Bureau of Mines, Report of Investigation* 5390, Feb. 1958, 15 p.
Empirical procedure for classifying the state of equilibrium in ores by measuring the radioactivity. Equilibrium method depends upon simultaneous measurement of the beta and gamma radiations given off by an ore. The apparent equivalent U content of the sample then is determined by comparing its beta activity with that of known assayed pitchblende standards in radioactive equilibrium. (S11q, S19; U, RM-n)

438-S. (English.) Determination of Oxygen in Titanium by the Micro Bromination Method. Mitsunao Takahashi, Makoto Kawane and Tetsuo

Mitsui. *Mikrochimica Acta,* no. 5, Jan. 1957, p. 647-657.
18 ref. (S11d; *O,* Ti)

439-S.* (English.) **Spectral-Isotopic Method for the Determination of Hydrogen in Metals.** A. N. Zaidel. *Spectrochimica Acta,* v. 10, Feb. 1958, p. 369-376.
Method using deuterium to compute hydrogen content of various metals. 12 ref. (S11r: *H*)

440-S.* (English.) **Spectrographic Analysis of Ores by Introducing the Powder Into the Arc in a Stream of Air.** A. K. Rusanov and V. G. Khitrov. *Spectrochimica Acta,* v. 10, Feb. 1958, p. 404-418.
New method for the spectrographic analysis of substances in powder form, using an alternating current arc, which is initiated by a high-frequency discharge, gives a significant increase in sensitivity and reproducibility, and reduces the time required for analysis. 9 ref. (S11k; RM-n)

441-S. (German.) **Role of the Chemist in the Production of Metallic Uranium and Thorium.** G. Wirths. *Acta Physica Austriaca,* v. 11, no. 4, Spring 1958, p. 471-481.
15 ref. (S11; U, Th)

442-S. (German.) **Determination of Metallic Impurities in Ultrapure Antimony by the Dithizone Method.** Erich Haberli. *Fresenius' Zeitschrift für Analytische Chemie,* v. 160, Feb. 1958, p. 15-20.
8 ref. (S11; 9-51; Sb-a)

443-S. (German.) **Volumetric Analysis of Phosphorus and Arsenic in Unalloyed Steel by the Differential Method With Quinolineammoniummolybdate.** S. Meyer and O. G. Koch. *Fresenius' Zeitschrift für Analytische Chemie,* v. 160, Mar. 3, 1958, p. 253-258.
5 ref. (S11j; *P, As,* CN)

444-S. (German.) **Photometric Determination of Aluminum in Alloyed Steels.** Helmut Lilie and Hartmut Rosin. *Fresenius' Zeitschrift für Analytische Chemie,* v. 160, Mar. 3, 1958, p. 261-267.

(S11d; Al)

447-S. (German.) **Are Ex-Electrons Suitable for Nondestructive Testing?** E. Schmid and K. Lintner. *Schweitzer Archiv,* Mar. 1958, p. 79-89.
41 ref. (S13e)

448-S. (German.) **Spectroscopic Analysis of Metals, Alloys and Ores.** W. Nabholz. *Schweiz, Technische Zeitschrift,* no. 21, May 23, 1958, p. 449-455.
(S11k)

449-S. (Russian.) **Checking Steel for Microcracks by Using Graded Samples.** I. V. Samolov. *Stal',* v. 18, Mar. 1958, p. 244-245.
Use of graded samples is of advantage only for stable high-quality steels. For other grades of steel a more efficient method should be substituted. 4 ref. (S13; ST, 9-72)

450-S. (Pamphlet.) **Steel Products Manual. Alloy Steel Sheets and Strip.** Apr. 1958, 37 p. American Iron and Steel Institute, 350 Fifth Ave., New York 1, N. Y.
Information for purchasers on tolerances, testing, terminology and manufacture. (S22, Q-general, AY, 4-53, 17-55)

451-S. (Pamphlet.) **Steel Products Manual. Flat Rolled Electrical Steel.** Jan. 1958, 39 p. American Iron and Steel Institute, 350 Fifth Ave., New York 1, N. Y.
Information for purchasers on tolerances, testing, terminology and manufacture. (S22, Q-general, ST, *Si,* 4-53, SGA-n, 17-55)

452-S. (Book.) **Symposium on Nondestructive Testing.** 99 p. 1956. American Society for Testing Materials, STP no. 213, 1916 Race St., Philadelphia 3, Pa.
Symposium sponsored by ASTM Committee E-7, Los Angeles, Calif., Sept. 17-18, 1956. Pertinent papers abstracted separately. (S13, S14)

453-S. (Book.) **Standards Manual for Copper and Copper-Base Alloy Mill Products.** 181 p. 1958. Copper & Brass Research Association, 420 Lexington Ave., New York 17, N. Y.
Standards for plates, sheets, strips, rods, bars, wire, pipe, tubes and shapes; tables, glossary. (S22; Cu-b)

454-S.* **New Foundry Testing Methods.** Carol A. Koerner. *American*

Foundrymen's Society, Transactions, v. 65, May 1957, p. 181-187.

Cobalt radiography as a tool for improving gating and as a quality control check. Sonic tester developed to separate good and bad castings by measuring the frequency vibration. Hard and soft castings sorted electronically.
(S13, S18, E-general)

455-S.* (Japanese.) **Quantitative Spectro-Analysis of Solution Method. Pt. 2. Quantitative Analysis of Cr, Fe and Si in Al-Cr Alloys.** Ushioda Toyoji, Yoshimura Osamu and Sada Masahiro. *Light Metals,* no. 30, May 1958, p. 34-37.

New method with carbon electrode which is not affected by its porosity and can be used in practical work. Analytical accuracy for Cr and Fe is satisfactory, but not for Si.
(S11k; Al, *Cr, Fe, Si*)

456-S.* **Radioisotopes and Their Uses in Metallurgy.** F. Scot. *Metal Treatment and Drop Forging,* v. 25, June 1958, p. 227-232.

Applications in thickness measurement, analysis, flaw detection and tracer techniques. 16 ref.
(S-general, 1-59; 14-63)

457-S. Radiographic Standards for Bronze Castings. Bureau of Ships. *U. S. Office of Technical Services,* PB 131854, July 1958. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $25.

Set of standard X-ray radiographic film copies for use in the evaluation of discontinuities which provide bases for comparison with radiographs from actual castings. They represent sections of gunmetal bronze plates (specification MIL-M-16576) cast ¾ in. thick. Discontinuities illustrated are gas porosity, shrinkage, sand inclusions, chaplets and tears. (S13e, S2z; Cu-s, 5-60)

458-S.* (Italian.) **Inspection of Anodic Coatings on Aluminum.** A. Prati. *Alluminio,* v. 27, Apr. 1958, p. 165-172.

Methods and equipment for determining thickness, porosity, resistance to corrosion, light and abrasion, dielectric rigidity and electrical resistance of coatings. 18 ref.
(S13, S14, P15, R-general; Al, 8-73)

459-S.* **Determination of Boron in Carbon and Low-Alloy Steels.** *Iron and Steel Institute, Journal,* v. 189, July 1958, p. 227-232.

Method based on the removal of metal ions from a solution of the sample by a cation-exchange resin and subsequent absorptiometric determination of boron in the eluate by means of dianthrimide. The method gives a high degree of reproducibility and sensitivity. 8 ref.
(S11f; CN-g, AY-b, B)

460-S.* (German.) **Zirconium-Magnesium Alloys.** G. N. Cherry, *Giesserei-Praxis,* v. 76, Apr. 25, 1958, p. 147-149.

Composition, heat treatment, mechanical and physical properties of English standards Elektron RZ5 and Z5Z for sand, and Elektron ZRE1 for sand and injection molding. Purpose of flux is to float out impurities and protect molten metal from oxidation. For casting, temperature from 700 to 780° is suggested. Iron and steel crucibles lined with fire-resistant material and careful cleaning and regular checking advised. Melting and refining process. 11 ref. (S22, E-general; Mg, Zr)

461-S.* **The Determination of Tungsten in Titanium, Zirconium and Their Alloys.** D. F. Wood and R. T. Clark. *Analyst,* v. 83, June 1958, p. 326-334.

To fulfill the need for satisfactory methods for the determination of W over the range 0.002 to about 1% in Ti and its alloys, two absorptiometric procedures have been developed, and subsequently extended to the examination of Zr and its alloys. 7 ref. (S11a; Ti-b, Zr-b, W-a)

462-S.* **Analysis of Bismuth Base Alloys. Pt. 3. Ternary Alloys Containing Uranium and Neodymium or Praseodymium.** G. W. C. Milner and J. W. Edwards. *Analytica Chimica Acta,* v. 18, June 1958, p. 513-519.

Procedures for the analysis of Bi-base alloys containing 0.2-5% U and 0.2-5% Nd or Pr. 16 ref.
(S11j, Bi-a, U-a, Nd, Pr)

463-S.* **The Polarographic Determination of Indium in Zinc-Base Alloys. Pt. 2. The Determination of Indium in Zinc and in Zinc Alloys of Low Aluminum Content.** G. F. Reynolds and H. I. Shalgosky. *Analytica Chimica Acta,* v. 18, June 1958, p. 607-611.

Studies of the application of an 8-hydroxyquinoline extraction and of a zinc oxide "collection" procedure for the separation of trace amounts of In from Zn alloys. 8 ref.
(S11m; Zn-b, In)

464-S.* **Polarographic Determination of Indium in Zinc-Base Alloys. Pt. 3. The Determination of Indium in Zinc and in "Lead-Free" Zinc Alloys.** G. F. Reynolds and H. I.

Shalgosky. *Analytica Chimica Acta,* v. 18, June 1958, p. 612-615.

A method for the polarographic determination of In in Zn alloys, applicable when the Pb concentration is small compared with that of In. 7 ref. (S11m; Zn-b, In)

465-S.* The Polarographic Determination of Aluminum. Pt. 1. General Introduction. Polarography of Solochrome Violet R. S. in the Presence of Aluminum. M. Perkins and G. F. Reynolds. *Analytica Chimica Acta,* v. 18, June 1958, p. 616-624.

The polarography of Al; study of method involving the modification by this element of the polarographic characteristics of a diortho-hydroxy azo dye. Interferences from other elements discussed; means for their removal. 36 ref. (S11m; Al-a)

466-S.* The Polarographic Determination of Aluminum. Pt. 2. The Determination of Microgram Amounts of Aluminum in Beryllium Metal. M. Perkins and G. F. Reynolds. *Analytica Chimica Acta,* v. 18, June 1958, p. 625-631.

The method involves the removal of Al from the bulk of the Be and from certain other elements by extraction with 8-hydroxyquinoline into chloroform. 11 ref. (S11m; Al-a, Be-a)

467-S.* The Polarographic Determination of Copper and Iron and Its Application in the Hydrometallurgy of Copper. R. J. Cathro and A. Walkley. *Australian Journal of Applied Science,* v. 9, June 1958, p. 105-114.

The results agree well with those determined by conventional volumetric and gravimetric procedures but the polarographic methods have the advantage of speed and directness. 10 ref. (S11m; Cu, Fe)

468-S. Analysis Control of Tin Bronze and Gun Metals. Jorma Kinnunen and Bertil Wennerstrand. *Foundry,* v. 86, July 1958, p. 97.

Outlines ethylenediaminetetraacetate (EDTA) titration method for determination of tin. 7 ref. (S11j; Cu-s, Sn)

469-S. Weld Radiography. *Industry and Welding,* v. 31, Mar. 1958, p. 28-45.

Explains radiography and its use in the shop and field for inspection and quality control of welds. Recommended equipment and setting for stationary and portable machines; films for various materials. (S13e, 7-51)

470-S.* Assessment of an Electronic Image-Intensifier for Weld Radiography. R. Halmshaw and C. Hunt. *Welding and Metal Fabrication,* v. 26, July 1958, p. 249-254.

Performance and potential range of application of a Philips image-intensifier tube. Techniques; attainable sensitivities. Comparisons of performance with radiography on film and with enlarged-image fluoroscopy are made with reference to the examination of welds. 9 ref. (S13e, T1j; 7-51)

471-S.* Two Apparatus for the Determination of Gases in Metals. D. L. Guernsey and R. H. Franklin. Paper from "Symposium on Determination of Gases in Metals", American Society for Testing Materials, STP no. 222, p. 3-14.

Discusses vacuum fusion technique and a specialized apparatus for determination of hydrogen in steel. Apparatus includes a furnace for hot extraction of hydrogen, heated either by induction or by resistance (7), as well as the original induction heated tin fusion furnace. 16 ref. (S11r)

472-S.* The Application of Vacuum Fusion to Gas-Metal Studies. A. L. Beach and W. G. Guldner. Paper from "Symposium on Determination of Gases in Metals", American Society for Testing Materials, STP no. 222, p. 15-24.

Extension of the vacuum fusion method to the study of Ge, Si, Ta and Mo. Fusion baths have been used to alloy samples. Data on an Fe bath, an Ni bath and a Pt-Fe bath. (S11r)

473-S.* Oxygen Determination Using a Platinum Bath and Capillary Trap. William G. Smiley. Paper from "Symposium on Determination of Gases in Metals", American Society for Testing Materials, STP no. 222, p. 25-32.

As in vacuum fusion, the sample is fused in a graphite crucible with a flux, but a stream of argon at atmospheric pressure is used in place of high vacuum. Platinum is not an effective flux for the refractory metals such as Ta and W; Pt-Co and Pt-Fe alloys dissolve these metals but give somewhat low results on known samples. The Pt bath

gave a standard deviation of 7 ppm. on 50-mg. Pu samples. Twenty-two elements and numerous alloys have been analyzed. 10 ref. (S11r; O)

474-S.* Bromination-Carbon Reduction Method for the Determination of Oxygen in Metals. Maurice Codell, George Norwitz and Silve Kallmann. Paper from "Symposium on Determination of Gases in Metals", American Society for Testing Materials, STP no. 222, p. 33-40.

Optimum temperature for the bromination reaction is approximately 900° C. At temperatures considerably less or greater, the reaction is slower. The use of bromine free from organic compounds is desirable. Graphite, platinum or gold boats may be used. The method has been applied to the determination of oxygen in Ti, Zr, Cr, V, steels and other metals. It is not applicable to steel containing oxide inclusions. 5 ref. (S11j; O)

475-S.* Emission Spectrometric Determination of Oxygen in Metals. Velmer A. Fassel, William A. Gordon and Ray W. Tabeling. Paper from "Symposium on Determination of Gases in Metals", American Society for Testing Materials, STP no. 222, p. 41-60.

Methods for the determination of oxygen in steel, titanium, the rare earths and other metals. Procedures are based on the liberation of the oxygen content of the metal into an argon atmosphere. Procedures described determine oxygen with a precision comparable to vacuum fusion or bromination—carbon reduction techniques and have the advantage of greatly reduced time requirements. 38 ref. (S11k; O)

476-S.* Temperature Measurement in Solids. W. H. Giedt. *Product Engineering,* v. 29, July 21, 1958, p. 65-67.

Description of thermistors, resistance elements and thermocouples, including temperature range, output error, cost and size. (S16b, X9)

477-S.* Separation of Niobium and Tantalum With Cupferron. A. K. Majumdar and J. B. Ray Chowdhury. *Analytica Chimica Acta,* v. 19, July 1958, p. 18-22.

Method gives highly satisfactory results when applied to the analysis of Cb in Cb-Mo stainless steel. (S11j; SS, *Cb, Ta*)

478-S.* Activation Analysis of Vanadium in High Alloy Steels Using Manganese as Internal Standard. G. Leliaert, J. Hoste and J. Eeckhaut. *Analytica Chimica Acta,* v. 19, July 1958, p. 100-107.

Method for the determination of V in high-alloy steels by radioactivation analysis. Manganese present in the steel sample is used as an internal standard, thus permitting accurate correction of neutron flux irregularities between sample and reference. (S11q; SS, *V*)

479-S.* Determination of Carbon in Titanium, Zirconium and Their Alloys by Gravimetric and Conductimetric Methods. D. F. Wood and M. Williams. *Metallurgia,* v. 58, July 1958, p. 47-52.

Carbon in Ti and Zr can be satisfactorily determined by a combustion method involving the use of argon to moderate the otherwise vigorous oxidation reaction, provided that suitable fluxes are mixed with the sample. 8 ref. (S11b, S11g; *C,* Ti, Zr)

480-S.* Investigations on Colorimetric Methods of Metallurgical Analysis. Pt. 6. Estimation of Silicon in Cast Iron Using the Duboscq Type of Colorimeter. G. V. L. N. Murty. *Metallurgia,* v. 58, July 1958, p. 52-54.

A simple procedure for the estimation of Si in pig iron which compares very favorably with the standard gravimetric methods, reduces time of analysis to 15 min. 10 ref. (S11a, *Si,* CI)

481-S.* Measuring Scratches Accurately Reduces Rejects. Bobly Siebel and Fred R. Miller. *Tool Engineer,* v. 41, Aug. 1958, p. 55-57.

Optical shadow projection instrument measures depth of scratches accurately to 0.00005 in. Instrument is portable, easily used. (S13d, S16d, 1-53)

482-S. Delayed Back-Up Roll Failure in Cold Rolling Mills. M. M. Krobin and K. V. Shishokina. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 43-48.

Factors which lead to sleeve failure. Since sleeves do not fail suddenly after having been shrunk onto shafts it was possible to observe the effect of continued static stresses. Based on observation that highly plastic, improved steel showed no tendency toward delayed failure, it is desirable to develop such heat treatment that would leave the sleeve with an extremely hard rolling surface and a soft center. Evidently surface hardening is indicated. 7 ref. (S21, Q-general)

483-S. (English.) **Activation Analysis of Manganese in Ferromanganese Alloy Using Radium-Beryllium Neutron Source.** Yuzuru Kusaka. *Chemical Society of Japan, Bulletin,* v. 31, Mar. 1958, p. 216-219.

Fluoroscopy is particularly successful in locating linear discontinuities—tears or cracks (hot or cold). Shrinkage may be seen readily if it is of the cavity type or of the coarse sponge variety. Micro-shrinkage is difficult to see. Three basic fluoroscopic geometric arrangements are used—conventional, high brightness and high definition. Techniques outlined. (S13e)

561-S.* (French.) **Surface Roughness After Grinding and Polishing.** Abbe Cayere. *Machine Moderne,* v. 52, June 1958, p. 33-37.

Conventional visual and mathematical procedures for evaluating surface roughness were found inadequate for hand ground and polished welded iron pipe joints. New approach is proposed in which roughness is viewed as factor which increases wetted surface. Coefficient of increase of wetted surface, obtained by relating normal length of given area to sum of measurements of saw-tooth profile of machined surface, becomes criterion of comparison with required standard. 601-S. (German.) **Design of an Optical Automatic Tester for Ball Bearings.** H. Schier. *Werkstattstechnik und Maschinenbau,* v. 48, July 1958, p. 356-360.

Description of a laboratory built tester with scanning microscope and multiplier. (S13d, 1-53)

602-S. (Spanish.) **Simultaneous Potentiometric Determination of Molybdenum and Tungsten in Alloy Steels.** Ramon Suarez. *Real Sociedad Espanola de Fisica y Quimica, Anales,* v. 54 (B), Apr. 1958, p. 285-290.

9 ref. (S11m; AY, *Mo, W*)

603-S. (Book.) **ASTM Standards on Copper and Copper Alloys B5.** 688 p. Sept. 1957. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $6.25.

Includes basic coppers, nonferrous metals used in the manufacture of Cu alloys, Cu and Cu alloy wrought products, ingots and castings, filler metal. (S22; Cu, 15-68)

604-S. (Book.) **Brittle Failure of Rotor Forgings.** 48 p. 1958. American Society for Testing Materials, Special Technical Publication, STP 231, 1916 Race St., Philadelphia 3, Pa. $2.

Problems associated with nondestructive inspection of rotor forgings. (S13, Q26s, 4-51)

605-S. (Book.) **Steel Piping Materials. A-1.** 460 p. 1958. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $5.

Covers pipe used to convey liquids, vapors and gases at normal and elevated temperatures; still tubes for refinery service; heat exchanger and condenser tubes and boiler and superheater tubes. (S22, W13h, 15-68)

606-S. (Book.) **Iron Castings: Compilation of ASTM Standards.** 168 p. 1958. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $2.75.

Thirty-two standards relating to pig iron, gray iron castings, cast iron pipe, nodular iron castings, malleable iron castings, welding rods and electrodes and general methods of test. (S22, E-general, W29h; 5-60, Fe, 15-68)

607-S.* (Japanese.) **Testing Tin-Plate.** Yoichi Kitamura. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 3-12.

Thickness of tin-plate is measured by chemical, electrolytic, electromagnetic, beta-ray and X-ray analysis. Pinhole and endurance tests are done chemically. Thin oxide film is measured by electrostripping method. Thickness of oil film is measured by extraction and repeated friction methods. These methods are applicable for both hot dipped tin-plate and electrolytic tinplate. (S13, S14; ST, *Sn,* 8-62, 8-65)

608-S.* (Japanese.) **Testing Galvanized Iron.** Kiyoshi Segawa. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 12-16.

Appearance test is useful. Chemical methods are applied in thickness, uniformity and impurity tests. Endurance is tested by water spray method, exposure method and rust measurement. Stripping test is mechanical. Deformability, tension and hardness are also tested. Stripping test is most important. 4 ref. (S13a, S13b, R-general, 1-54; ST, *Zn,* 8-65)

609-S.* (Japanese.) **Testing Acid-Proof Enamel, Glass Lining and Ceramic Coating.** Kokichi Tanaka. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 16-20.

Standard practice for testing advocated. Testing glass linings and ceramic coatings should include endurance, instantaneous heating and cooling, mechanical strength and pinhole and crack tests. Testing of acid-proof enamel should also include endurance acid resistance tests. (S13a, S13b, S13m; NM-f42, NM-g34)

610-S.* (Japanese.) **Current Physical Methods for Thickness Measurement.**

Mitsuo Sugimoto. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 26-31.

Magnetic method for thickness measurement of thin films is applicable up to 2000 microns. Magneto-induction method is useful in the same range. High-frequency eddy current method can compensate magnetic method and is applicable for diamagnetic samples. Thermocouples have been applied recently and can measure 0.5 to about 1.5×10^{-3} in. Error is of the order of $\pm$ 5%. 10 ref. (S14, X20c)

611-S.* (English.) **Analysis of Microquantities of Antimony, Tin and Arsenic in Ferrotungsten.** Hidehiro Goto, Yachiyo Kakita and Masahiko Sase. *Tohoku University, Science Reports of the Research Institutes,* v. 10 no. 3, June 1958, p. 207-211.

Procedure for spectrophotometric determination. 5 ref.
(S11k; As, Fe, Sb, Sn, W, AD-n)

612-S.* (English.) **Spectrophotometric Determination of Germanium With Quercetinsulfonic Acid.** Takuji Kanno. *Tohoku University, Science Reports of the Research Institutes,* v. 10, no. 3, June 1958, p. 251-258.

Use of 3, 5, 7, 3′, 4′ pentahydroxyflavon-6′-sulphonic acid (quercetinsulphonic acid) for photometric determination of Ge. 12 ref.
(S11a; Ge)

613-S.* (Czech.) **Determination of Iron in Blast Furnace Iron Ores.** Jan Michal and Jaroslav Zalud. *Hutnické Listy,* v. 13, no. 7, 1958, p. 639-641.

Decomposition of specimen with perchloric and phosphoric acids. Reduction of trivalent Fe to bivalent with Ag reducer and titration with potassium bichromate.
(S11j; Fe, RM-n)

614-S.* (Czech.) **Polarographic Determination of Indium.** D. Weiss. *Hutnické Listy,* v. 13, no. 7, 1958, p. 641-643.

Polarographic method for determination of In in slightly acid chloride environment. Masking and removing interfering influence of V, Cd and other elements. Method has high sensitivity. (S11m; In)

615-S.* (Japanese.) **Sampling of Castings.** Kazuo Yasuda. *Metals,* v. 28, July 1958, p. 495-498.

Anisotropy of castings is caused by gravity, incomplete diffusion in solid phase and speed of cooling. Test pieces, taken from small and rapidly cooled samples, should be from different parts of the sample. Quartering is necessary. Correct sampling is very important in spectroscopic analysis. 14 ref.
(S12h, S11k; 5-60)

616-S. (French.) **Rapid Radiometric Determination of Uranium and Thorium in Complex Ores.** G. Jurain and P. Maillot. *Journal de Physique et le Radium,* v. 19, suppl. to no. 4, Apr. 1958, p. 35A-37A.

Method based on two gamma activity measurements carried out with series of scintillation counters and by fixing two different values of gain of pre-amplifier. Two results are thus obtained and these, associated with results obtained by standardization, allow calculation of percentages of U and Th. This method is applicable only to ore in radioactive equilibrium.
(S11q; U, Th, RM-n)

638-S. Determination of Copper, Lead, Tin and Antimony by Controlled-Potential Electrolysis. Pt. 1. General Method of Analysis. B. Alfonsi. *Analytica Chimica Acta,* v. 19, Sept. 1958, p. 276-283.

Controlled-potential electrolysis method by which it is possible to deposit Cu, Pb, Sn and Sb from the same solution in successive stages. Behavior of each metal during deposition; best working conditions. Determinations are not affected by moderate amounts of Ni, Zn, Mn, Fe, Al. 8 ref. (S11g; Cu, Pb, Sn, Sb)

639-S. Aluminum Identification Simplified. *Steel,* v. 143, Oct. 6, 1958, p. 76-77.

New series of designations applying to stress-relieved Al mill products. Applies only to the heat-treatable series. (S22, S10; Al)

640-S. (German.) **Preparation and Examination of Chemical Analytical Samples.** Alfred Stetter. *Stahl und Eisen,* v. 78, Aug. 7, 1958, p. 1126-1129.

Principles followed in the preparation of check samples to maintain equal chemical composition and physical properties. (S12h)

641-S. Chemical Analysis of Thorium. C. J. Rodden and M. W. Lerner. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 352-370.

Methods for the determination of the following impurities: Al, C, H, Fe, N, O_2, Si, Zr, B, Cd, rare earths, U, Mg, Cr, Cu, Pb, Mn, Mo, Ni, Ti and Zn. 81 ref. (S11; Th)

642-S. The Spectrographic Analysis of Thorium. Velmer A. Fassel and Edward DeKalb. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 371-390.

Carrier distillation technique; conducting briquet technique; determination of the rare earth metals. 14 ref. (S11k; Th)

643-S.* Steel Castings for Radioactive Service. George Sorkin. *Foundry,* v. 86, Oct. 1958, p. 71-73.

Experience in the purchase and inspection of steel castings for radioactive service is seen in the latest revision in specifications. In addition to requirements for cleaning, heat treatment and resistance to intergranular corrosion, nondestructive testing by radiography, liquid penetrant examination and hydrostatic tests are required. (S12, S13, 2-67; ST, 5-60)

644-S.* (Russian.) **Use of Betatron to Study Metal Defects.** A. E. Byzynov, M. D. Mochalov and I. G. Fakidov. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 986-988.

Use of betatron gamma defectoscope with radiation of sufficient intensity at comparatively short intervals makes it possible to reveal tiny defects in steel 500 mm. thick. 14 ref. (S13e; ST)

645-S.* (Russian.) **Use of Radiography for Measurement of Thickness of Rolled Sheet.** A. M. Bogachev. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 1029-1032.

It is recommended that for sheet from 0.03 to 0.5 mm. thick β-rays be used, and from 0.5 to 3 mm. soft γ-rays be used. (S14e; ST, 4-53)

646-S.* Radiographing Fusion Welded Joints in Steel Plate Up to Two Inches. *Canadian Machinery,* v. 69, Aug. 1958, p. 114-116.

Recommended practice of the International Institute of Welding for X-ray and gamma-ray inspection to insure uniform results. Three classes of inspection; image quality indicator devices. (S13e; ST, 7-51)

647-S.* (French.) **Industrial Application of Alpha Radioactivity to the Continuous Determination of Uranium in Solution.** J. D. Le Franc, P. Pottier and G. Roux. *Energie Nucleaire,* v. 2, July-Sept. 1958, p. 195-201.

A method for determination of U in leaching solutions of uranium-bearing ores by measurement of the alpha radioactivity of these so-

lutions make it possible to follow variations of concentration in U during recovery of the metal by means of anion-exchanger resins. Reasons for choice of alpha radiation, etc. Application of method to recovery of U in sulphuric and alkaline solutions; apparatus designed for industrial usage. (S11q, C19s; U)

648-S. Separation of Rhodium and Iridium From Base Metals by Ion Exchange. Alice G. Marks and F. E. Beamish. *Analytical Chemistry*, v. 30, Aug. 22, 1958, p. 1464-1466.

11 ref. (S11f; Ir, Rh)

649-S. Spectrographic Analysis of Silicon-Germanium Alloys. Marvin C. Gardels and Hubert H. Whitaker. *Analytical Chemistry*, v. 30, Aug. 22, 1958, p. 1496-1498.

12 ref. (S11k; Ge, Si)

650-S. Automatic Inspection. D. H. McConnell. *Mechanical Engineering*, v. 80, Oct. 1958, p. 65-67.

Automatic preprocess, in-process, and post-process gaging builds precision and higher production into the modern machine tool. Signals from gages insure quality, effect savings. (S14, G17, 18-74)

651-S. Tube Testing Gains Precision. *Steel*, v. 143, Oct. 13, 1958, p. 104-106.

Republic Steel Corp.'s Farrowtest machine works on the eddy-current principle to locate internal defects in tubing. (S13h; 4-60; ST)

652-S. (English.) **Separation of Rhenium by Coprecipitation and Its Determination in Molybdenite.** Yen Jen-Yin and Tao Tseng-Ning. *Scientia Sinica*, v. 7, July 1958, p. 730-737.

15 ref. (S11f, S11j; Re)

653-S. (German.) **Determination of Oxygen Content of Steel by the Gotta Process.** Erich Stengel. *Archiv für das Eisenhüttenwesen*, v. 29, June 1958, p. 351-352.

Under accurately maintained environmental conditions the results are not quite as reliable as those obtained from vacuum melting but are satisfactory for normal laboratory control purposes. (S11r; ST, *O*)

654-S.* Nondestructive Testing Methods of Quartermaster Items and Aerial Delivery Evaluation. Roderick W. Browne. *Nondestructive Testing*, v. 16, Sept-Oct. 1958, p. 385-396.

The Quartermaster Corps has an unusual position in that quality must be controlled at the time of production, during testing and evaluation, and throughout storage until use. As a quality control and inspection method, nondestructive testing is used as an inspection method before testing, a control method during testing, and an evaluation application following the test. (S13)

655-S.* An Evaluation of the Effectiveness of Penetrants. R. E. Kleint. *Nondestructive Testing*, v. 16, Sept-Oct. 1958, p. 421-429.

Penetrant inspection is a valuable tool for detecting surface defects and is becoming increasingly important with the increased use of nonmagnetic structural materials such as Ti and nonmagnetic stainless steels. Investigations designed to develop a method of evaluating the effectiveness of penetrants, evaluate the effect of variables (such as machining, anodizing and vapor honing) on the effectiveness of penetrants, compare effectiveness of penetrants to other means of detecting surface defects such as etching or chromic acid anodizing of Al alloys. (S13k)

656-S.* Radiography and Autoradiography of Plutonium. Dana E. Elliott and Gerold H. Tenney. *Nondestructive Testing*, v. 16, Sept-Oct. 1958, p. 430-437.

By selecting the right energy of radiation, radiographic inspection can give valuable information about the internal physical condition of plutonium. When familiar with the type of radiation originating in this metal, radiographers can take preventive measures to avoid its damaging influence on the radiographic image. The presence of this radiation can be utilized to study the quality of the coatings surrounding the material. Such study is absolutely necessary to protect the objects under investigation as well as the lives of workers handling this material. (S13e, A7r; Pu)

657-S. (English.) **Separation of Rhenium by Coprecipitation and Its Determination in Molybdenite.** Yen Jen-Yin and Tao Tseng-Ning. *Scientia Sinica*, v. 7, July 1958, p. 730-737.

15 ref. (S11a; Re)

658-S. (French.) **Determination of Phosphorus in Aluminum-Silicon Alloys.** Vsevolod Kuhn. *Fonderie*, June 1958, p. 279-282.

Metal is treated in HCL in hydrogen atmosphere, thus freeing sol-

uble phosphorus in form of gaseous phosphuretted hydrogen, which is collected in a solution of brominated hydrobromic acid. Phosphoric acid thus formed is determined photocolorimetrically, using reduced phosphomolybdate method, currently used in analysis of steels. A large fraction of phosphorus remains in undissolved Si. Latter is treated by nitrohydrofluoric solution; phosphorus remaining in residue after evaporation is determined colorimetrically, as above. 7 ref. (S11a; Al, P, Si)

659-S. (Japanese.) **Rapid Simultaneous Photometric Determination of Aluminum and Iron in Titanium or Vanadium by the Oxinate Extraction Method.** Hiroshi Hashitani and Kenji Motojima. *Japan Analyst,* v. 7, Aug. 1958, p. 478-483.

12 ref. (S11a; *Al, Fe,* Ti, V)

660-S. (Japanese.) **Rapid Absorption Spectro-Photometric Determination of Phosphorous in Steels and Special Steels by the Extraction Method.** Mitsuru Ura. *Japan Analyst,* v. 7, July 1958, p. 420-424.

10 ref. (S11a; ST, *P*)

661-S. (Japanese.) **Direct Polarographic Determination of Lead in Free-Cutting Steel.** Kazuo Ota. *Japan Analyst,* v. 7, July 1958, p. 429-432.

(S11m; ST, *Pb*)

662-S. (Russian.) **Chromatographic Determination of Small Admixtures in Nickel-Based Pure Metals.** V. V. Stepin, V. I. Ponosov and E. V. Silaeva. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 934-938.

Determination of small quantities of bismuth, lead, cobalt, nickel, phosphorus, iron and copper. 12 ref. (S11g; Ni, *Bi, Co, Cu, Fe, P, Pb*)

663-S. (Russian.) **Radiometric Determinatian of Uranium, Thorium and Radium in Ores.** E. I. Zheleznova and D. V. Tokareva. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 959-963.

5 ref. (S11q; U, Ra, Th, RM-n)

664-S. (Russian.) **Radiometric Determination of Calcium in Minerals.** S. I. Krichmar and L. G. Kaistra. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 925-927.

(S11q; Ca, RM-n)

665-S. (Russian.) **Method of Multiple Radioactive Dilution for Determination of Small Admixtures in Metals.** I. E. Zimakov and G. S. Rozhavskii. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 922-925.

Method makes possible determination of admixtures up to size of 10^{-7}%. Applied to determination of Sb in Pb. (S11q; Pb, *Sb*)

666-S. (Russian.) **Spectrophotometric Determination of Columbium in Alloys.** I. P. Kharlamov, P. Ya. Yakovlev and M. I. Lykova. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 928-932.

Alloys contained Si, W, Mo and Ti. Results corresponded with volumetric tests. Reproducible results also good. 7 ref. (S11k; Cb)

667-S. (Russian.) **Determination of Silver in Alloys by Radiometric Titration.** V. I. Plotnikov. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 927-928.

Determination of Ag in Cu and Pb-base alloys using strongly acidic solutions containing up to 10% HNO_3. (S11q; *Ag,* Cu, Pb)

668-S. (Russian.) **Analysis of Pure Metals.** V. A. Nazarenko and G. G. Shitareva. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 932-934.

Determination of admixtures of Co in Bi. Method also applicable for determination of Co in Sb, Ge, and Ti. 4 ref. (S11; Co, Ge, Sb, Ti)

669-S. (Russian.) **Chipless Method for Analyzing Metals and Alloys.** A. G. Loshkarev. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 939-940.

Consists of gravimetric analysis of the basic components followed by computation of percentage of admixtures in alloy by use of a given formula. Determination of weight of components can also be made by potentiometric and amperometric methods. (S11b)

670-S. (Russian.) **Determination of Silicon Content in Surface Layers by Microhardness Method.** Z. G. Ordina. *Zavodskaya Laboratoriya,* v. 24, no. 8, 1958, p. 1015-1016.

Method of studying changes in surface hardness as a result of changes in chemical composition of metal can be applied to many other elements. (S11g, Q29q; Si)

671-S. (Spanish.) **Rapid Determination of Phosphorus in Carbon Steels and Cast Irons by Colorimetry and Photo-Absorptiometry.** Ricardo de la Cierva. *Instituto del Hierro y del Acero,* v. 11, Apr-June 1958, p. 85-90.

Method permits determination of P during production of steel in elec-

tric furnace; also applicable to cast irons; gives results in 7 to 12 min. 19 ref. (S11a, S11g; ST-f, *P*)

672-S.* Production Inspection of Pipe and Tubing by the Immersed Ultrasonic Method. R. B. Oliver, R. W. McClung and J. K. White. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 62-79.

Use of ultrasonic techniques detects extremely small defects in pipe designed for critical applications. Method is rapid, highly reliable. (S13g, 4-60)

673-S.* An Eddy Current Test for Capillary Tubing. W. R. Plant and C. Mannal. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 80-87.

Highly sensitive apparatus for flaw detection, especially radial cracks and longitudinal seams. (S13h, 1-53; 4-60)

674-S.* Two Applications of Eddy Current Instruments to Testing of Zircaloy Core Components. R. A. Betz. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 119-126.

Method detects both flaws which cause in-service failure and those affecting heat transfer properties of the cladding materials. (S13h, T11g; Zr)

675-S.* Use of Penetrants for Inspection of Small Diameter Tubing. R. B. Oliver, G. M. Tolson and A. Taboada. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 127-141.

Surface inspection of Hastelloy, Inconel tubing with fluorescent penetrant is very effective for detecting cracks, laps; less so for broad, shallow defects. (S13k; Ni-b, 4-60)

676-S.* Radiography of Materials Used in the Nuclear Energy Field. J. W. Dutli and D. E. Grimm. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 150-164.

Techniques employed. Details of exposure for plastic, graphite, Be, Zr, Pb, Th, Ta, W alloy, U, Pu and Au. (S13e, T11; Be, Zr, Pb, Th, Ta)

677-S.* Ultrasonic Testing as a Method of Determining Variables in Processing Zircaloy and Hafnium. Edwin W. Fink. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 175-180.

Testing method to detect laps, laminations, cracks and other defects occurring during processing. (S13g, T11; Zr, Hf)

678-S.* Testing of Cylindrical Fuel Elements With the Cyclograph. W. J. McGonnagle. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 214-224.

Use of cyclograph to detect voids and cracks, nonbonded areas and thin spots in the clad of U rods encased in 2S Al cans. (S13h, T11g; U, Al)

679-S.* Nickel Thickness Gage. Louis H. Cook, Jr. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 225-230.

Thickness of Ni foils from 0.001 to 0.0006 in. is determined within ± 10% by measuring reluctance of magnetic circuit. (S14h, X20c; Ni, 4-56)

680-S.* Radiography of Fuel Elements and Fuel Materials Using Cesium-137. Merle L. Rhoten. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 266-272.

Cesium-137 fills energy gap in the range 0.4-0.6 Mev between 14-192 and Co-60 for radiography of heavy elements and fuel components. (S13e, T11g; Cs, 14-63)

681-S.* Measurement of Cladding Thickness on Uranium by Autoradiography. G. E. Bradley, W. J. McGonnagle and P. R. Gonzales. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 294-303.

Use of the natural radioactivity of the core material to measure the cladding thickness of Zr-clad fuel elements. Accuracy of ±0.5 mil at a scanning speed of 4 in. per min. 4 ref. (S14e; U, *Zr*, 8-66)

682-S.* Analysis for Certain Metallic Impurities in Niobium. James F. Reed. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 54-56.

General problems of dissolving samples and separation of con-

stituents. Typical results of determination of Fe, Ti and Zr in commercial Cb. 5 ref. (S11; Cb, 9-51)

683-S.* **The Determination of Nitrogen and Oxygen in Niobium.** William F. Harris. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 57-59.

Two methods for determination of nitrogen in Cb. Results obtained by solution distillation and alkali fusion methods were in good agreement. Vacuum fusion technique employing a Pt bath was used for determination of oxygen in Cb. 4 ref. (S11r; Cb, *N, O*)

684-S.* (Japanese.) **Recent Methods for Measurement of Surface Roughness.** K. Yamamoto. *Metals,* v. 28, Oct. 1958, p. 752-757.

Quantitative expressions for roughness are represented by either maximum height, root mean square height deviation, centerline average height, form factor, contact ratio or bearing curve. Measurements are done either mechanically, optically or electrically. (S14)

685-S. **Plating Thickness Indicator Designed.** *Industrial Finishing (London),* v. 10, Sept. 1958, p. 44-45.

713-S. Analysis of Microquantities of Antimony, Tin and Arsenic in Ferrotungsten. Hidehiro Goto, Yachiyo Kakita and Masahiko Sase. *Tohoku University, Science Reports of the Research Institutes*, v. 10, June 1958, p. 207-211.

Spectrophotometric method is proposed.
(S11k; Fe, W, AD-n31, *Sb, Sn, As*)

714-S. Simplified Determination of Microquantity of Carbon in Iron, Steel and Ferro-Alloy. Hidehiro Goto, Toshio Watanabe and Kyohei Suzuki. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 2, 1958, p. 97-102.

(S11; *C*, CI, ST, AD-n31)

715-S. Spectrographic Determination of Magnesium in Bismuth-Uranium Alloys. J. C. Cotterill. *United Kingdom Atomic Energy Authority, AERE C/R 2456*, 1958, 7 p.

Bi alloys are converted to oxide and mixed with a spectrographic buffer containing ferric sulphate. Pellets of this mixture are excited in the d-c. arc using Cu electrodes, and spectra are evaluated by microphotometry using the Fe as internal standard. The effective concentration range is 50-700 ppm.
(S11c; Bi, U, *Mg*)

716-S. Improved Analytical Methods of Separating Lead. G. W. C. Milner, J. W. Edwards and A. Paddon. *United Kingdom Atomic Energy Authority, AERE C/R 2612*, 1958, 6 p.

Ion exchange and solvent extraction methods investigated for the separation of Pb in the analysis of Pb-base materials. 6 ref.
(S11f, C19; Pb)

717-S. Analysis of Sodium Metal and Sodium-Potassium Alloy. *United Kingdom Atomic Energy Authority* IGO-AM/CA-110, 1958, 65 p.

724-S. Eddy Current Measurement of Clad Thickness. J. W. Allen, R. A. Nance and R. B. Oliver. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 201-213.

Basic principles of eddy current testing as applied to metal thickness and cladding thickness meas-

urements. Results illustrate capability to measure small cladding thicknesses accurately and reliably. 4 ref. (S14h; 8-66)

725-S. Ultrasonic Transmission Tester for Detection of Unbonded Areas. J. D. Ross and R. W. Leep. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 238-245.

An ultrasonic pulse is transmitted through the object under inspection and the received pulse is checked for abnormal attenuation. The abnormally attenuated pulses can be counted as the object is scanned and the total count is a measure of the area over which the defect extends. (S13g)

726-S. Electrode Potential Method of Bond Testing. W. G. Marburger, J. H. Monaweck and W. J. McGonnagle. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 278-285.

Utilizes principle that the electrical resistivity in the immediate neighborhood of a flaw differs from that in solid metal. Specially designed electrodes have made continuous semi-automatic scanning of a specimen possible. (S13c)

727-S. Radiographic Inspection of Nuclear Core Materials and Components. A. E. Oaks. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 304-319.

Utility of different types of radiographic equipment. Exposure data are given for Zr, Hf and U alloys in the range of 150 to 1000 kv. Conversion factors relating these alloys to equivalent thicknesses of steel are also given.
(S13e, T11; Zr, Hf, U)

728-S. Techniques for X-Ray Examinations of End-Weld Closures of Cylindrical Fuel Elements. S. S. Sidhu. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 320-327.

(S13e, T11g; U, 7-51)

729-S. Helium Leak Detection Techniques. W. H. Pappin. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 328-338.

A practical, relatively inexpensive, very accurate, and convenient nondestructive test in many fields where leak-tight joints are important. (S18q, T11)

730-S. A Nondestructive Method for Fuel Assaying. S. G. Forbes. Paper from "Symposium on Nondestructive Tests in the Field of Nuclear Energy", ASTM STP no. 223, 1958, p. 375-381.

A nondestructive method of assaying the Materials Testing Reactor fuel assemblies for their U^{235} content before they are loaded into the reactor. (S19, T11g; U)

731-S. Analysis for Plutonium by Controlled Coulometry. F. A. Scott and R. M. Peekema. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/914, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Method can be applied to the determination of Pu solution concentrations in the range of 0.05 to 50 g. per liter. Electronic equipment, titration cells and procedures are simple and dependable enough for routine application in a control laboratory. (S11m; Pu)

732-S. Spectrographic Determination of Oxygen, Nitrogen and Hydrogen in Metals. V. A. Fassel, W. A. Gordon and R. J. Jasinski. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/917, 1958, 15 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Experimental techniques and equipment for determination of oxygen and nitrogen in steel, oxygen in Ti, Zr, Nb, Y and hydrogen in Ti. 9 ref.

21-T. **Stainless Hopper Cars Stand Long Service.** J. Halbig and R. K. Thompson. *Iron Age,* v. 180, Oct. 17, 1957, p. 118-119.

Hopper cars made from Type 410 stainless steel inspected after 20 years of continuous coal hauling.
(T23p, 17-57; SS)

22-T. **Selecting Friction Materials. Pt. 2. Resilient and Metallic Materials. Property Comparison Data.** Elwin J. Salter. *Materials in Design Engineering,* v. 46, Nov. 1957, p. 134-137.

For automotive, industrial and aircraft applications. Covers semimetallic, cerametallic and metallic material.
(T21c, T24c; 17-57; SGA-m, SGA-c)

23-T. **Materials for Gears.** Norman E. Woldman. *Materials in Design Engineering,* v. 46, Nov. 1957, p. 149-164.

Selection factors. Data on steel, gray cast iron, nodular iron, bronzes, metal powder and nonmetallics.
(T7a, 17-57; ST, CI-n, CI-r, Cu-s, Fe, 6)

24-T.* **Present Utilization of Titanium.** *Metal Progress,* v. 72, Nov. 1957, p. 93-96.

Still too costly for common use, titanium and its alloys are finding many military and civilian applications where high material costs can be justified by the advantages obtained. Greater uniformity of properties, variety of alloys available, lower cost and added user experience point to a steady increase in titanium's future acceptance.
(T24, T29, T2, 17-57; Ti)

25-T.* **Alloys for Precious Metal Jewerly.** Ralph H. Atkinson. *Metal Progress,* v. 72, Nov. 1957, p. 107-111.

Although an integral part of the broad field of metalworking, the precious metal jewelry manufacturing industry has developed its own unique materials and processes. De-

scribes the metals most frequently used by that industry.
(T9s, 17-57; Au, Ag, EG-c)

26-T. Tool Steels for the Moulding of Plastics. C. C. Hanson. *Metallurgia*, v. 56, Sept. 1957, p. 109-114.

Compares wear resistance, toughness, depth of hardening, risk of distortion, machinability, strain resistance, hardness of several commonly used die steels for plastics molding. (T6r, W24n; TS-b)

27-T. Automatic Factories. Pt. 2. Peter Trippe. *Metalworking Production*, v. 101, Nov. 8, 1957, p. 1995-2005.

British Timken compared to American and Russian bearing plants. (T7d, 1-11, 18-17)

28-T. History of the Railway Axle. From Faggotted Wrought Iron to Forged Steel. *Metallurgia*, v. 56, Nov. 1957, p. 229-230.

(T23, 17-57; Fe-m, ST)

29-T. Aluminum Use in Cars Goes Up. C. E. Morphew. *SAE Journal*, v. 65, Oct. 1957, p. 62.

(T21, 17-57; Al)

30-T. Trends of Stainless Steel. *Steel*, v. 141, Nov. 4, 1957, p. 107-122.

American producers and forms they make; present application and future uses of stainless in the automotive, aircraft and railroad industries, in home appliances, food processing equipment, hospital equipment, building—industrial, petroleum, textile and chemical industries, in the field of atomic industry and as fasteners. Types of stainless and their composition, fabrication, machining, forging, casting or powder part production.
(T general, 17-57; SS)

31-T. Development and Testing of Cemented Tungsten Carbide Tipped Drill Steels. Pt. 1. Development of Integral Drill Steel. Pt. 2. Testing. *University of Missouri, School of Mines and Metallurgy, 2nd Annual Symposium on Mining Research.* Curt Dahlin. Technical Series, no. 94, 1957, p. 67-92.

Design and dimension of integral drill steels; properties of cemented tungsten carbide; brazing technique, brazing alloys; drill steels and their mechanical properties; Swedish testing of steels under laboratory control conditions but with regular standard production equipment at Swedish and South African Mines by Sandvik Steel Works. 6 ref.
(T6n, 17-57; TS, W, 6-69)

32-T. (German.) **Lubrication and Design of Sleeve Bearings. Pt. 2.** Karl Droste. *Stahl und Eisen*, v. 77, Sept. 1957, p. 1196-1204.

Bearing characteristics, configuration of the sliding space and bearing materials. 23 ref. (T7d, 18-73, 17-51)

33-T. Stainless Steel in Aromatics Production. Richard E. Paret. *American Perfumer*, v. 70, Sept. 1957, p. 56, 58.

Excellent cleanability, great strength, high resistance to attack of acids, chemicals and to corrosion make stainless steel virtually indispensable in manufacture of soaps, perfumes and other fragrance products. (T29, 17-57; SS)

34-T. Niobium as a Nuclear Metal. M. J. Cotter. *Atomics and Nuclear Energy*, v. 8, Sept. 1957, p. 339-342.

Resources, discovery, separation of Cb, preparation of metal, chemistry, prices, metallurgical aspects, importance in nuclear applications, fabrication, compatibility with U. 7 ref. (T11, 17-57, A general; Cb)

35-T. Tough Home-Made Tools From Scrap Steel and Stellite. S. J. Meno. *Canadian Machinery*, v. 68, Sept. 1957, p. 113.

How to make cutters which bridge the gap between carbide and high speed steel. (T6n, 17-57; ST, SS)

36-T. Steel Speeds Supersonic Flight. *Canadian Machinery*, v. 68, Sept. 1957, p. 124-128, 196-202.

17-7 PH, 17-4 PH, and AM-350 steels, their mechanical and physical characteristics and heat treating.
(T24a, 17-57; SS)

37-T. Huge U. S. Senate Annex Roofed With Copper. Lawrence E. Gichner. *Heating and Air Conditioning Contractor*, v. 48, Sept. 1957, p. 58-61.

Twenty-ounce hard Cu was used in one of year's largest Cu roofing jobs. Design and on-job fabrication details. (T26n, 17-57; Cu)

38-T.* Motor Makers Discuss Aircraft Construction. J. L. McCloud. *Metal Progress*, v. 72, Dec. 1957, p. 77-81.

With the advent of strong sheet steels for airplane structures, dimensional tolerances, their machining, bonding and plating introduce new problems. Electrolytic grinding and milling, as well as metallizing in vacuum, are interesting and important innovations.
(T24a, G24, K12, L17, L23, 17-57)

39-T. Reactor Materials. D. O. Luser. *Nucleonics,* v. 15, Sept. 1957, p. 137-139.

Problems of thermal, radiation and corrosion stability of reactor materials. (T11, 17-57)

40-T.* Ceramic-Oxide Cutting Tools. R. M. Gill. *Machinery,* v. 91, Dec. 6, 1957, p. 1341-1346.

Chemical and physical properties of ceramic oxide tools; advantages of ceramic oxide tooling; recommendations for use; typical test results. (T6n, G17, 17-57; 6-70)

41-T.* Mechanical Tubing. Jack C. Merriam. *Materials in Design Engineering,* v. 46, Dec. 1957, p. 127-146.

Types and shapes of mechanical tubing available, working and fabrication and some typical applications. Principal characteristics of the tubing materials: carbon and alloy steels; stainless steels; Cu, Ni, Al, Mg, Ti and specialty alloys. (T7, 17-57; 4-60)

42-T.* Mechanical Springs — Materials, Finishes and Embrittlement. Lester F. Spencer. *Metal Finishing,* v. 55, Dec. 1957, p. 56-60.

Nominal composition of spring materials including carbon and alloy steels, Cu and Ni-base alloys, and precipitation hardening stainless; protective coatings—Cd and Zn plate; salt spray resistance; embrittlement. (To be continued.) (T7c, 17-57; CN, AY, SS, Ni, Cu)

43-T. Automobile Instrumentation. Pt. 2. *Metal Industry,* v. 91, Nov. 8, 1957, p. 395-396.

Use of die castings. (T21c, 17-57; 5-61)

44-T.* Materials and Processes for the Hot Airplane. H. B. Sipple and G. G. Wald. *Steel Processing and Conversion,* v. 43, Dec. 1957, p. 679-685.

Temperature problem associated with aerodynamic heating; definition of the structural problem; comparison of structural materials from point of view of effect of temperature on properties; fabricating and processing problems. (T24, 17-57; SGA-h)

45-T.* Metallic Material Engineering and Manufacturing Aspects of New High-Speed Aircraft. E. A. Simkovich. *Steel Processing and Conversion,* v. 43, Dec. 1957, p. 686-690.

Certain trends are becoming increasingly apparent: Ti alloys (particularly those responsive to heat treatment) plus the new die steels will adequately cover the range of 250-1000° F. in airframes. Other steel sheet alloys, such as AM350, 15-7Mo, 17-7PH, 422 or 422 modified, will also fill specific requirements in this regime. For temperatures above 1000° F. airframes will probably follow engine trends and utilize the superalloys to a great extent. (T24a, 17-57, SGA-h)

46-T. Canadian Landing Gear Uses 260,000 Tensile Steel. G. F. W. McCaffrey. *Canadian Metalworking,* v. 20, Oct. 1957, p.8-12.

Landing gear was machined from modified SAE 4340 steel and heat treated in neutral salt bath followed by oil quenching and double tempering to give tensile strength of 260,000 psi. (T24, G17, J26; AY)

47-T. Galvanized Structural Steel in Gulf Coast Construction. *Industrial and Engineering Chemistry,* v. 49, Dec. 9, 1957, p. 69A-70A.

Celanese's experience at Bishop, Tex., has led to the use of galvanized, rather than painted, steel in its new, low-pressure polyethylene plant. 4 ref. (T26n, 17-57; ST, *Zn,* 8-65)

48-T. Use of Magnesium in Future Aircraft and Missile Structures. John H. Rizley and Robert E. Mihalco. *Light Metal Age,* v. 15, Dec. 1957, p. 24-27.

(T24, 17-57; Mg)

49-T. How Will We Shape the New Materials? Alfred H. Petersen. *Machine and Tool Blue Book,* v. 52, Dec. 1957, p. 113-124.

Problems in replacing Al with high-strength steel and Ti alloys for framework of aircraft. (T24a; Ti, Al, SS)

50-T. Machining Pontiac's New Steering Knuckle. Lewis B. Arscott. *Machinery,* v. 64, Dec. 1957, p. 130-135.

Knuckles are forged from SAE 1345 steel. After inspection, forgings are heated to 1550° F. in a continuous gas-fired furnace, quenched in oil and drawn to produce a Brinell hardness of 241 to 286. (T21c, F22, J26; CN)

51-T. Ford Speeds Output of Needle Bearings. *Machinery,* v. 64, Dec. 1957, p. 136-143.

(T7d; ST)

52-T. How Auto-Lite Produces 1958 Bumpers. Charles Starzman. *Machinery,* v. 64, Dec. 1957, p. 174-179.

Polishing, phosphatizing, pressing, automatic cleaning, Ni and Cr plat-

ing and rinsing of high-tensile steel sheet.
(T21c, L general; ST, SGB-a, *Ni, Cr*)

53-T. New Chevrolet Transmission Plant Now in High Gear. Edgar Altholz. *Machinery,* v. 64, Dec. 1957, p. 180-187.

Die-casting, forging, machining, forming and welding. Die-caster used is largest in automotive industry. (T21c, E13, 1-52, G general, Al)

54-T. Automatic Factories—Britain Has One, Too. Peter Trippe. *Metalworking Production,* v. 101, Nov. 1, 1957, p. 1973-1977.

Layout and operations in British roller bearing plant. (T7d, 18-74)

55-T. Chance Vought Uses More Steel Castings. *Modern Castings,* v. 33, Jan. 1958, p. 26-28.

(T24, 17-57; ST, 5-60)

56-T. Howard Foundry Builds Quality Into Aircraft Castings. Charles F. Maxwell. *Modern Castings,* v. 32, Jan. 1958, p. 32-36.

Al and Mg foundry practice.
(T24, E general, 17-57; Al, Mg)

57-T. Automotive Gray Cast Iron. D. L. Watson. *Canadian Metalworking,* v. 20, Nov. 1957, p. 42-46.

(T21, 17-57, 2-60; CI-r)

58-T. New Alloy for Reactor Control. *Chemical and Engineering News,* v. 36, Jan. 6, 1958, p. 56.

Control rod alloy of Ag, Cd and In that's cheaper than Hf.
(T11j, 17-57; Ag, In, Cd)

59-T. What's Ahead for Aluminum in Autos. H. F. Barr. *Modern Metals,* v. 13, Oct. 1957, p. 31-42.

Use of Al in Chevrolet's automatic transmission case and fuel injection system. Predicts increases in Al use by automobile industry.
(T21, 17-57; Al)

60-T. Ultra-Lightweight Aluminum Foam. *Modern Metals,* v. 13, Oct. 1957, p. 68-70.

Note on production and properties of Al foam. (T10, 17-57; Al)

61-T. (Italian.) **Packing Materials as a Factor in the Preservation of Fresh Fish.** M. Gualtieri. *Alluminio,* v. 26, Nov. 1957, p. 469-571.

At room temperature as well as under refrigeration, common mackeral and horse mackerel were found to keep better longer in Al containers than in wooden. 4 ref.
(T10g, T29p, 17-57, Al)

62-T. (Italian.) **Contribution of Nickel to the Progress of the Chemical Industry.** *Nickel,* no. 70, Oct. 1957, p. 15-19.

Applications of Ni in equipment for production and handling of synthetic resins, pharmaceuticals, insecticides, etc., resistance of Ni to atmospheric attack and to corrosion by water, salts, acids, gases, alkalis.
(T29, R general, 17-57; Ni)

63-T. (Russian.) **Zinc Alloy Guides on Heavy Machine Tools.** Yu. N. Sychev. *Stanki i Instrument,* v. 28, Sept. 1957, p. 39-40.

(T6n, 15-57; Zn)

64.-T.* High-Temperature Loop for Circulating Liquid Metals. R. W. Fisher and G. R. Winders. Paper from "Liquid Metals Technology", Pt. 1. Chemical Engineering Progress Symposium Series, p. 1-6.

A tantalum loop enclosed in outer envelope of Inconel used in connection with electromagnetic pump and heating transformer to study flow rate, corrosion and mass transfer in circulation of an Mg-Th eutectic and a Bi-U alloy at temperatures of 800 to 950° C. and times up to 5000 hr.
(T11p, 17-57, R2a, R6m; Ta, Mg, Th, Bi, U)

65-T. Fiber Metal Commutator Brushes. Cord H. Sump, George A. Forster and Harlan G. Hamre. *Electrical Manufacturing,* v. 60, Dec. 1957, p. 128-129.

Molybdenum fiber brush on silver-plated slip ring assembly overcomes electrical raise problems. Operation at speeds up to 30,000 fpm. shows no rapid wear or overheating.
(T1, H17, 17-57; Ag, Mo)

66-T. Powdered Metal Tool Bodies Boost Machining Efficiency. Horace Frommelt. *Iron Age,* v. 180, Nov. 14, 1957, p. 166-167.

Powdered metal tool bodies dampened vibration, increasing tool life in milling SAE 1020 and SAE 4340 steels. (T6n, G17b; ST, AY, 6-72)

67-T. Aluminium Aerosol Containers in Europe. *Light Metals,* v. 20, Nov. 1957, p. 359-362.

(T10g, 17-57; Al)

68-T. Light Alloys and Road Transport—a Critical Commentary. *Light Metals,* v. 20, Nov. 1957, p. 366-367.

(T21d, T21e, 17-57; Al, Mg)

69-T. Aluminium in Public Lighting. *Light Metals,* v. 20, Dec. 1957, p. 397-403.

Aluminum is replacing other materials in street-lighting equipment in many countries. (T26a, 17-57; Al)

70-T. Making the Massey-Harris Ferguson-35 Tractor. *Machinery,* v. 91, Dec. 13, 1957, p. 1360-1372. (T3n)

71-T. French Developments in Sintered Ceramic Cutting Tools. Leon Gion and Louis Perrin. *Machinery,* v. 91, Dec. 20, 1957, p. 1420-1430.

Manufacture of sintered oxide ceramics and tests on the application and behavior of the material when used for cutting tool tips. Tests included the machining of various grades of steel and cast iron, and gave information on effects of various rates of feed, surface speed and depth of cut. (T6n, G17, 17-57; 6-70)

72-T.* Porous Metal Filter Media Solve Tough Operating Problems. Jules Kovacs. *Materials in Design Engineering,* v. 47, Jan. 1958, p. 126-128.

Filter units are made by sintering metal powders of controlled particle size to obtain the desired porosity and pore size. Metals are selected to meet specific service requirements and include all grades of stainless steel, nickel, Monel, Inconel, Hastelloy, Durimet 20, bronze, NiAg, Au and Ag. (T7, 17-57, H15, 6-71)

73-T. Forum on Enamelling in Architecture. E. Mackasek and T. J. MacArthur. *Metal Finishing Journal,* v. 3, Oct. 1957, p. 413-417.

Vitreous enamel, steel and aluminum panels for curtain walls and other architectural purposes. Problems encountered. (T26n, L27; Al, ST)

74-T. Kaiser Aluminum Deep Drawn Cans for Food Industry. *Modern Industrial Press,* v. 19, Dec. 1957. (T10g, 17-57, G4b; Al)

75-T. Testing Titanium Afloat. *Modern Metals,* v. 13, Jan. 1958, p. 32-40.

Nine types of Ti boat fittings weighing 312 lb. give 43.5% weight saving in luxury cruiser. Aim of Mallory-Sharon test program is to prove Ti's value in rigorous seagoing use. (T22, 17-57; Ti)

76-T. Aluminum: New Process. Latest Can-Making Techniques Seen as Means of Increasing Marketing Potential for Aluminum. *Packaging Parade,* v. 25, Dec. 1957, p. 68-72. (T10g, 17-57; Al)

77-T. Platinum-Cored Thermionic Valves in the Transatlantic Telephone Cable. G. H. Metson. *Platinum Metals Review,* v. 2, Jan. 1958, p. 2-6.

British repeater remarkable for high-slope tubes with platinum cored cathode, which increase traffic handling capacity. (T1b, 17-57; Pt)

78-T.* Development of High-Tensile Aluminium-Bronze Alloys for Marine Propellers in Great Britain and the United States of America. F. Hudson. *Shipbuilder and Marine Engine Builder,* v. 64, Dec. 1957, p. 681-687.

Advantages of high-tensile Al-bronze for propeller source; founding of marine propellers, including melting and molding practice. (T22h, 17-57, E10; Cu-s, Al)

79-T. Tool Steels. Steels for Plastic Molding Applications . Pt. 6. L. F. Spencer. *Steel Processing and Conversion,* v. 43, Oct. 1957, p. 570-575.

Chemical composition, carburizing and tempering treatments, mechanical properties, corrosion resistance of typical toolsteels used for cavity molds or hobbs for plastic molding application. Consideration in selecting steel. 4 ref. (T29s, 17-57; TS)

80-T. Some Producibility Aspects of Advanced Aircraft Structures. Alfred H. Peterson. *Western Machinery and Steel World,* v. 48, Dec. 1957, p. 90-93.

Introduction of higher strength alloys needed for future aircraft, machining and weight problems. (T24, G17; SGA-h, SGB-a)

81-T. (French.) Use of Nickel and Nonferrous Nickel Alloys in Naval Construction. L. Arbellot. *Revue du Nickel,* v. 23, Sept. 1957, p. 73-85.

Mechanical properties and resistance to corrosion of Ni, Monel and Cu-Ni alloys. (T22, Q general, R general, 17-57; Ni)

82-T. (German.) Aluminum as a Printing Surface. R. Brammer. *Aluminium,* v. 33, Dec. 1957, p. 794-797. (T9n, 17-57; Al)

83-T. (German.) Aluminum Alloys as Electrode Material. H. Grefkes. *Aluminium,* v. 33, Dec. 1957, p. 802-803.

Extruded electrodes of Al-Mg-Si alloys behave well in upsetting time, life and cost. 7 ref. (T1f, F22j; Al, 17-57)

84-T. Production of Integrally-Stiffened Panels for the Vanguard Airliner. *Machinery (London),* v. 91, Nov. 15, 1957, p. 1124-1136.

Operations at Vickers-Armstrong. (T24a, G general)

85-T. Construction of the Airframe for a Guided Anti-Aircraft Missile. F. B. Stencel. *Machinery (London),* v. 91, Nov. 15, 1957, p. 1137-1140. (From *Aluminium Suisse.*)

(T24e)

86-T. (French.) Electricite de France's Information Center at Avignon. André Chevrier. *Revue de l'Aluminium,* v. 34, Dec. 1957, p. 1220-1223.

Decorative and structural Al extensively used in modernized building. (T26n, 17-57; Al)

87-T. (Russian.) Development of Toolsteel. Y. A. Geller. *Metallovedenie i Obrabotka Metallov,* Nov. 1957, p. 43-56.

Compares effectiveness of carbon steel, high-Cr steel and high-speed steel in tool performance. (T6n, 17-57; TS)

88-T. Evaluating Ceramic Tools. Pt. 1. D. R. Kibbey and W. T. Morris. *Automatic Machining,* v. 19, Jan. 1958, p. 36-38.

Analysis of variables and multivariable testing method used to determine how various variables affect cutting tool performance. (To be continued.) (T6n, 17-52; 6-70)

89-T.* Ceramic Cutting Tools—a Progress Report. George W. Barnes. *Grits and Grinds,* v. 48, no. 11, p. 3-8.

New La 687 tool material now being field tested shows much promise; appears to be 6 to 8 times better than its predecessor in wear resistance and tool life. (T6n, Q9n, 17-57; 6-70)

90-T. French Development in Sintered Ceramic Cutting Tools. Leon Gion and Louis Perrin. *Machinery,* v. 91, Dec. 20, 1957, p. 1420-1430.

Manufacture of sintered oxide ceramics and tests on the application and behavior of the material when used for cutting tool tips. Tests included the machining of various grades of steel and cast iron, and gave information on effects of various rates of feed, surface speed and depth of cut. (T6n, G17, H10, 6-70)

91-T. Milling Cutters Standardized for Light Metal. *Modern Metals,* v. 13, Nov. 1957, p. 56-58.

Standardized milling cutters designed especially for Al and Mg. (T6n, W25r; Al, Mg)

92-T. What Will Be the Future of Investment Castings in Aircraft and Missiles? A. H. Langenheim. *Precision Metal Molding,* v. 16, Jan. 1958, p. 44-45.

(T24, 17-57; 5-62)

93-T. Application of Precoated Steel Sheets in Industry. F. H. Smith. *Sheet Metal Industries,* v. 34, Dec. 1957, p. 915-923, 928.

Advantages of using electro-zinc precoated sheet steel illustrated for a wide variety of pressed cold formed and assembled parts. (T general, L17, 4-53; ST, *Zn*)

94-T. Automatic Production of Tapered Roller Bearings. *Sheet Metal Industries,* v. 34, Dec. 1957, p. 924-928.

(T7d, 17-57, 18-74)

95-T. Choosing Valve Materials. Joseph R. Driear. *Steel,* v. 141, Dec. 9, 1957, p. 161-162.

(T7b, 17-57; ST)

96-T. Fabricating the Redstone Missile. *Steel,* v. 142, Jan. 20, 1958, p. 66-71.

(T24e, G general, 17-57; Al)

97-T. These Bearings Don't Wear Out. *Steel,* v. 142, Jan. 20, 1958, p. 82-83.

Aluminum-on-steel bearings have an increased fatigue resistance and compressive strength. (T7d, Q28g, Q7a, Q9n, Al, *ST*)

98-T. Recent Progress in Cutting Tool Materials. William E. Montgomery. *Tooling and Production,* v. 23, Feb. 1958, p. 88-92.

Conventional tungsten carbides and new harder carbides such as WF, having a titanium carbide base with Mo as an alloy carbide addition and using Ni as a binder. (T6n, 17-57, 6-69)

99-T.* Materials and Welding for Nuclear Power Fuel Elements. L. M. Wyatt and F. S. Dickinson. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 378-385, 396.

Forms of fuel elements and importance of welding in their manufacture. Tensile properties of canning materials, possible reactions between coolant and uranium, between coolant and can, and proper conditions and procedure for brazing and arc welding Mo, Ta, Zr, V, W, Mg, Al and stainless steels. (T11g, K1, K8, Q general, 17-57; Al, Be, Mg, Mo, Ta, Zr, SS)

100-T. Fabricating Earth Satellites. *Welding and Metal Fabrication,* v. 25, Nov. 1957, p. 443.

(T24f)

101-T. (German.) **Recent Experiments Concerning the Production of Gears.** H. Rettig. *Das Industrieblatt,* v. 57, Aug. 1957, p. 338-393.

Experiments with noncutting techniques in shaping of gears (and heavy-duty transmissions). Results with hot pressing, cold rolling, punching (gear wheels of sheet metal or heavy plate) and sintering of spur gears.
(T7a, G11, G2j, H general)

102-T. (Russian.) **Cast Crankshafts for Automobile Engines.** D. P. Glukhov. *Liteinoe Proizvodstvo,* July 1957, p. 6-7.

Composition, microstructure and application of cast iron in production of crankshafts. (T21b, 7-57; CI)

103-T. (Pamphlet.) **Thermal Resistance of Airspaces and Fibrous Insulations Bounded by Reflective Surfaces.** H. E. Robinson, L. A. Cosgrove and F. J. Powell. Report 151, Nov. 14, 1957, 22 p. U. S. Government Printing Office, Washington 25, D. C. 20c.

Report on investigation at National Bureau of Standards on insulating values of panels insulated with Al foil membrane and Al foil in combination with fibrous insulations. (T26n, 17-57, 4-56; Al)

104-T. Materials for "Hot" Rocket Parts Must Withstand 1700° F. Plus. R. C. Kopituk. *Aviation Age,* v. 28, Jan. 1958, p. 104-109.

(T2p, 17-57; SGA-h)

105-T. Machining With a "Throw-away" Insert. H. B. Iron. *Design Engineering,* v. 4, Jan. 1958, p. 36-39.

Use of "throw-away" solid carbide insert holders for carbide cutting tools eliminates cutter or tool sharpening operations and reduces costs. (T6n, W25d, 1-52)

106-T. Aluminium Busbars. H. B. Grainger and R. J. Watkins. *Engineering,* v. 184, Dec. 13, 1957, p. 744-748.

Development of new alloy which overcomes mechanical and electrical difficulties in use of Al busbars. (T1b, 17-57; Al)

107-T. Manufacture of Thin-Walled Leaded-Copper Bearings. G. K. Ogale and P. R. Abhyankar. *Indian Institute of Metals, Transactions,* v. 10, 1956-57, p. 187-194.

Process studies; preparation of bearings; performance test. 21 ref. (T7d; Cu, *Pb*)

108-T. Production of Components for Lambretta Motor Scooters. *Machinery,* v. 92, Jan. 10, 1958, p. 60-73. (T10h, G-general, 1-52)

109-T. Vertical Take-Off and Landing. Lawrence J. Hull. *Metal Progress,* v. 73, Feb. 1958, p. 68-71.

Thrust from a powerful jet engine gives vertical take-off; control of direction is by slight changes in the direction of the main exhaust and stability against roll is by jet reaction controls, all electrically interlinked at the pilot's fingertips. (T24, 17-57)

110-T. Steels for the Petroleum Industry. F. A. Kirk. *Petroleum,* v. 21, Jan. 1958, p. 19-25.

Detailed comparison of the corrosion and heat resisting steels specified in Great Britain and the U.S.A. for use in the petroleum industry. (T29n, T28, 17-57; ST, SGA-g, SGA-h)

111-T. Western-Made High-Precision Instrument Bearings. Penn DeRoche. *Western Machinery and Steel World,* v. 49, Jan. 1958, p. 72-76.

(T7d, G general; SS)

112-T. (German.) **Nickel-Molybdenum Alloys in the American Chemical Industry.** G. R. Barrow. *Chemische Rundschau,* v. 10, Dec. 16, 1957, p. 561-564.

(T29, 17-57; Mo, Ni)

113-T. (German.) **Experiences With Steel Framework in the Tunnels of the Iron Mine Friederike.** W. Fritzsche. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 10, Nov. 1957, p. 543-549.

(T28m, 17-57; ST)

114-T. Silver-Indium-Cadmium Alloy Control Rods for Pressurized Water Reactor. E. F. Losco, I. Cohen and R. R. Eggleston. *American Society of Mechanical Engineers,* Paper no. 57-A—230, Dec. 1957, 12 p.

8 ref. (T11j, 17-57; Ag, Cd, In)

115-T. Titanium Fasteners. R. T. Allsop. *Aircraft Production,* v. 20, Jan. 1958, p. 2-8.

(T7f, 17-57; Ti)

116-T. Titanium for Missile Applications: Pt. 1. B. L. Baird and C. W. Handova. *Industry and Welding,* v. 31, Feb. 1958, p. 40-41, 89-90.

(T24e, 17-57; Ti)

117-T. Boron Steel for Control Rods and Thermal Shields. Nicholas Balai. *Nucleonics,* v. 11, Jan. 1958, p. 100-101.

(T11j, 17-57; ST, *B*)

118-T. Metallurgy and the Plastics Industry. *Rubber and Plastics International Journal,* v. 133, Dec. 28, 1957, p. 1020-1024.

Recent developments in metallurgy as they relate to plastics industry; ductile cast iron, cold extruded steel, ductile Ni-Cr cast iron, glass-steel bonded storage tanks and Vinyl coated steel. (T29s, 17-57)

119-T. Will Gears Operate at 600° F? E. E. Shipley. *American Machinist,* v. 102, Feb. 10, 1958, p. 101-103.

Dynamic testing of gear materials and lubricants indicates future success with Nitralloy-N and synthetic or metallic lubricants.
(T7a, 17-57; AY, SGA-h, NM-h)

120-T. Evaluating Ceramic Tools. Pt. 2. D. R. Kibbey and W. T. Morris. *Automatic Machining,* v. 19, Feb. 1958, p. 42-44.
(T6n, 17-52; Al, 6-70)

121-T. What We Need in High Temperature Materials. Pt. 1. A. J. Carah. *Iron Age,* v. 181, Jan. 23, 1958, p. 75-77.

Limitations of Al, Mg, Ti and steel alloys present urgent need for development of alloy-lean, heat resistant steels for aircraft and missile production. (T24, 2-62, 17-57; SGA-h, Al, Mg, Ti, AY)

122-T. High Strength Cast Alloys Used for Low Cost Jet Fighter Parts. *Western Metalworking,* v. 16, Jan. 1958, p. 63.

Aluminum castings for fuel tank pylons and canopy breakers are stronger, lighter and less expensive than parts machined from bar stock. (T24, 17-57; Al, 5-60)

123-T. Development of Electric Cable Manufacture. C. G. Gorton. *Wire Industry,* v. 25, Jan. 1958, p. 67-68.
(T1b, 17-57; Al, NM-d)

124-T. (French.) **Strength of Monobloc Tanks.** R. Epain. *Metallurgie et la Construction Mecanique,* v. 90, Jan. 1958, p. 15-23.

Calculations for construction of banded monobloc tanks for high-pressure service. Stresses, equilibrium equations, elastic strength, banding and banding with wire in monobloc vessel. (To be continued.) (T26q)

125-T. (Hungarian.) **New Hard Lead Alloys for Battery Grids.** Laszlo Pesthy. *Kohaszati Lapok,* v. 12, Jan-Feb. 1957, p. 53-57.

Hard lead is an alloy of Pb and Sb. Antimony may be replaced by Pb-Ca alloys, Cd, Te and Li. 4 ref. (T1, 17-57; Pb, *Ca, Cd, Li, Te*)

126-T. (Russian.) **Hard Metal Spiral Tools.** N. A. Rozno. *Stanki i Instrument,* v. 28, Nov. 1957, p. 29-32.

Tools for working corrosion resistant and tempered steels and alloys of unusual toughness and strength. (T6n, G17; SGA-g, ST)

127-T. Materials for Superheater Tubes and Supports. D. W. Crancher. *Institute of Marine Engineers,* Advance Copy, Jan. 14, 1958, p. 1-18.

Qualities of six tube steels developed for use for superheater tubes and supports for boilers. Creep and corrosion resistance, mechanical strength, use of welding, availability. 41 ref.
(T22h, W11k, 4-60, R2g, Q3; ST)

128-T. Iron-Ore Handling and Preparation. Use of Conveyors at East Moor Works of Guest Keen Iron and Steel Co., Ltd. T. H. Keen. *Iron and Coal Trade Review,* v. 176, Jan. 24, 1958, p. 197-202.
(T28r, W12r, 1-52; Fe, RM-n)

129-T.* A Progress Report on Titanium-Alloy Fasteners. John Van Hambersveld. *Machine Design,* v. 30, Jan. 23, 1958, p. 123-127.

Major advances in heat treating and fabrication techniques have combined to produce high-strength fasteners with good fatigue resistance under aerodynamic loads.
(T7f, 17-57; Ti)

130-T.* Properties, Application, and Examination of Ferrous Metals Used in Colliery Engineering. J. Pettit. *Mining Electrical and Mechanical Engineer,* v. 38, Jan. 1958, p. 195-204.

Types of metal, tests used to show characteristics, heat treatment and applications, with some design data; examination during use and wear. 17 ref. (T28, 17-57; ST, CI)

131-T.* Piping Systems and Metallurgy for Nuclear Applications. *Power Engineering,* v. 61, Dec. 1957, p. 114-118.

Basic mechanism of radiation damage and its manifestations (vacancies, thermal spikes, interstitials, impurity atoms, radiation effects); effects on piping design and metals used in piping systems, especially where primary loops are involved; corrosion problems in nuclear systems; relative merits of steel castings versus forgings for primary loop applications.
(T11p, 17-57, M25, M26, 2-67)

132-T. Plutonium-Aluminum Fuel Element Development. M. D. Freshley. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-52457, Sept. 18, 1957, 44 p.

21 ref. (T11g, 17-57; Pu, *Al*)

133-T. Zirconium Moderator Reflector Can Development for the SRE. J. A. Leppard. Atomics International. *U. S. Atomic Energy Commission,* NAA-SR-2006, Dec. 15, 1957, 35 p. (Available at U. S. Office of Technical Services, $.30.)

The graphite moderator used in the Sodium Reactor Experiment is sealed against the liquid sodium coolant by being enclosed in Zr cans. The cans are fabricated of hafnium-free unalloyed Zr sheet, 0.035 and 0.100 in. thick. Fabrication procedures, welding techniques and sequences, testing of full-size assemblies, and extensive investigation and testing of the can head structure. 4 ref. (T11h, G1, K1d, 17-57; Zr)

134-T.* (German.) **Hard Metal Tools for Reshaping and Cutting.** J. Witthoff. *Draht,* v. 8, Nov. 1957, p. 465-470.

Properties of hard metals. Advantages for tools include precise machining, high-quality products, time saving, low production costs. Mostly tungsten carbide-cobalt alloys are used. Tungsten content influences favorably the hardness, cobalt content increases bending strength.
(T6n, Q-general, G17; W, Co, 6-69)

135-T.* (German.) **Recent Experiences With Multi-Purpose Hard Metals.** J. Witthoff. *Werkstattstechnik und Maschinenbau,* v. 47, Nov. 1957, p. 603-610.

Composition and properties of various types of hard metal tools.
(T6n, Q-general; SGA-j, 6-69)

136-T. What We Need in High Temperature Materials. Pt. 2. A. J. Carah. *Iron Age,* v. 181, Jan. 30, 1958, p. 102-104.

Need for new high-temperature materials and methods for fabricating and joining them.
(T24, 17-57; SGA-h)

137-T. French Developments in Sintered Ceramic Cutting Tools. Leon Gion and Louis Perrin. *Machinery,* v. 91, Dec. 20, 1957, p. 1420-1430.

Manufacture of sintered oxide ceramics and tests on the application and behavior of the material when used for cutting tool tips. Tests included the machining of various grades of steel and cast iron, and gave information on effects of various rates of feed, surface speed and depth of cut.
(T6n, G17, 17-57; 6-70)

138-T.* Where to Use the New Semiconductor Materials. Robert K. Willardson and Theodore S. Shilliday. *Materials in Design Engineering,* v. 47, Mar. 1958, p. 114-118.

Properties and applications of high-temperature rectifiers and transistors, galvanomagnetic devices, thermistors, optical and thermo-electric devices. (T1, X25, 17-57; EG-j)

139-T. Materials and Processes in Manufacture of Costume Jewelry. Ralph H. Atkinson. *Metal Progress,* v. 73, Mar. 1958, p. 74-78.

Skilled artisanship and mass production are combined to satisfy a growing demand for inexpensive jewelry with a fine jewelry appearance. (T9s, 17-57)

140-T.* A High-Strength Cast Steel. C. G. Mickelson and R. D. Engquist. *Metal Progress,* v. 73, Mar. 1958, p. 97-98.

A low-alloy, Mn-Cr-Mo cast steel with boron and rare earth additives which can be heat treated to tensile strengths above 220,000 psi. possesses excellent ductility and impact properties plus great wear resistance in dipper teeth, chute liners and tractor shoes.
(T28, 17-57, Q-general; AY, 5-60)

141-T.* Instrument Bearings for 300° F. and Up. Neil A. Sinclair. *Product Engineering,* v. 29, Feb. 3, 1958, p. 72-75.

Bearing materials and lubricants for high-temperature operation.
(T7d, X-general, 2-62; NM-h)

142-T. (French-German.) **Venetian Blinds Made of Light Alloy Materials.** M. Spechsa. *Aluminium Suisse,* v. 8, Jan. 1958, p. 3-10.

(T10k, 17-57; Al, Mg)

143-T. (French-German.) **Aluminum in the Construction of Automatic Equipment for the Food Processing Industry.** R. Liegaut. *Aluminium Suisse,* v. 8, Jan. 1958, p. 11-16.

(T29p, 17-57; Al)

144-T. (French-German.) **Use of Movable Partitions as Office Dividers.** P. Suter. *Aluminium Suisse,* v. 8, Jan. 1958, p. 17-24.

(T26n, 17-57; Al, Mg)

145-T. (French-German.) **New Covered Parking Lot for Automobiles.** R. Voetlin. *Aluminium Suisse,* v. 8, Jan. 1958, p. 25-30.

Design and construction details of aluminum alloy and concrete stalls.
(T26n, 17-57; Al)

146-T. (French-German.) **New Aluminum Scaffolding for Construction Workers.** *Aluminium Suisse,* v. 8,

Jan. 1958, p. 32-33.
(T26n, 17-57; Al)

147-T. (French-German.) **Use of Copper for Facades in Finnish Architecture.** Erkki Valve. *Pro-Metal,* v. 10, Dec. 1957, p. 911-915.
(T26n, 17-57; Cu)

148-T. (German.) **Status of Ceramic Cutting Tools.** A. Richter. *Fertigungstechnik,* v. 7, Nov. 1957, p. 489-493.
Comparison of the wear of ceramics and hard metals in machining. Ceramics have a greater resistance to temperature than hard metals and the higher cutting speed, but their manufacture is costly.
(T6n, 17-57, G17; SGA-j, 6-70)

149-T. (German.) **Ceramic Cutting Tools.** E. Heymel. *Fertigungstechnik,* v. 7, Nov. 1957, p. 496-497.
(T6n, G17; SGA-j, 6-70)

150-T. (German.) **Piston Rings of Sintered Steel.** E. Baumgartl. *Fertigungstechnik,* v. 7, Nov. 1957, p. 501-504.
Piston rings of sintered steel are equal in some respects to cast iron rings, and superior to them in many others. Attempts have been made in many countries to use piston rings of sintered steel in internal combustion engines.
(T21b, 17-57, Q-general; ST, 6-72)

151-T. (German.) **Titanium Carbide Hard Metals for Cutting Tools.** R. Wehner and R. Kohlermann. *Fertigungstechnik,* v. 7, Nov. 1957, p. 498-500.
TiC can be considered as the only hard metal with high resistance to wear; comparison with tungsten carbide and ceramic materials; problem of eliminating the free carbon. 10 ref. (T6n, 17-57; Ti, 6-69)

152-T. (German.) **Ceramic Tools and Their Use.** E. Heymel. *Fertigungstechnik,* v. 8, Jan. 1958, p. 2-8.
Description of various ceramics, their properties and applications. Sharpening of ceramic tools.
(T6n, 17-57; 6-70)

153-T. (Japanese.) **Ceramic Cutting Tools.** Makoto Okoshi and Toshio Sata. *Japan Society of Mechanical Engineers, Transactions,* v. 23, Oct. 1957, p. 691-696.
(T6n, 17-57; 6-70)

154-T.* **Cast Iron for Glass Molds.** R. Barton. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Feb. 1958, p. 146-156.
Composition and microconstituents of cast iron; principal properties required in cast iron used as a material for glass molds and the effect of changes in composition and structure on these properties. A straight unalloyed iron with 3.4 to 3.6% total carbon, 1.8 to 2.2% Si, 0.12% max. S, 0.45 to 0.8% Mn, and 0.4% max. P has served the general purposes of the glass industry as satisfactorily as the more elaborate irons. (T29a, 2-60, 17-57; CI)

155-T. Metallic Materials of Construction. M. Birkhead. *Chemical and Process Engineering,* v. 38, Oct. 1957, p. 396-398.
(T26, T29, 17-57)

156-T.* **Survey Hot-Work Tool Steels for Aircraft and Missiles.** R. J. Nekervis, C. H. Lund and A. M. Hall. *Iron Age,* v. 181, Feb. 27, 1958, p. 99-102.
General review of properties of six alloy steels with applications for aircraft and missiles.
(T24, 17-57, Q-general; TS-k)

157-T. Making Titanium Pressure Vessels. *Metal Industry,* v. 92, Jan. 17, 1958, p. 49-50.
High-strength, low-weight pressure vessels for storage of oxygen, helium and carbon dioxide aboard supersonic aircraft and missiles have been fabricated from 6 Al-4V titanium alloy. (T24d, T26q, 17-57; Ti, *Al, V*)

158-T. Tool Steels for Aircraft. L. V. Klaybor. *Steel Processing and Conversion,* v. 44, Jan. 1958, p. 16-18.
Properties of high speed toolsteels as applied to aircraft structural components. (T24a, 17-57; TS-m)

159-T.* **New Steel for Hot Airplanes and Missiles.** M. E. Carruthers. *Steel Processing and Conversion,* v. 44, Jan. 1958, p. 19-23.
Mechanical properties and heat treatment of Mo PH 15-7 stainless steel for missiles and hot airplane parts. (T24a, 17-57; SS, *Cr, Ni, Mo*)

160-T.* **Use of Magnesium in Future Aircraft and Missile Structures.** John H. Rizley and Robert E. Mihalco. Paper from "Magnesium in Perspective", Magnesium Association, p. 1300-1310.
(T24a, T24c, 17-57; Mg)

161-T. Magnesium, 2000 A. D. R. M. Brick. Paper from "Magnesium in Perspective", Magnesium Association, p. 1400-1406.
(T-general, 17-57; Mg)

162-T.* **Use of Magnesium in Electronic Structures.** H. R. Bullock.

Paper from "Magnesium in Perspective", Magnesium Association, p. 1601-1605.

Corrosion resistance, stretch forming, design principles, material strength of Mg alloys.
(T1, A-general, 17-57; Mg)

163-T.* (Czech.) **Reasons for Short Life of Springs.** Frantisek Benes. *Hutnické Listy,* v. 13, Jan. 1958, p. 22-26.

Material defects or spring overstressing and surface defects causing fractures. Fractures in springs intended for injection pumps may be due to faulty manufacture (e.g., equipment for heat treatment, and impurities in the material); resonant vibration also contributes. In springs made of quenched wire, failures are less frequent. 10 ref. (T7c, 17-57, 9)

164-T. (German.) **Behavior of Aluminum Facades Under Earthquakes in Mexico.** H. Grathwohl. *Aluminium,* v. 34, Feb. 1958, p. 78-81.

(T26n; Al)

165-T. (German.) **Aluminum in Radar Equipment.** H. Meier. *Aluminium,* v. 34, Feb. 1958, p. 102-103.

(T1, X15q; Al, 17-57)

166-T. (German.) **Service Life of Anti-Friction Bearings.** L. Hasbargen. *Werkstatt und Betrieb,* v. 91, Mar. 1958, p. 120.

(T7d, Q9p)

167-T. (Italian.) **Aluminum in Cigarette Packaging.** *Alluminio,* v. 27, Jan. 1958, p. 20-23.

Types of Al packaging materials used in U. S. and Italy.
(T10g, 17-57; Al, 4-56)

168-T.* **Corrugated Steel Foil Promises Lighter, Stronger Aircraft.** Bruce Mitchell. *Iron Age,* v. 181, Feb. 6, 1958, p. 102-104.

Aircraft can either be 25% lighter, or without adding any weight, can be made to withstand aerodynamic heating to 750° F. This can be done by putting miniature corrugations in very thin sheets of high-strength stainless steel, such as 17-7PH alloy. (T24, 17-57; SS, 4-56)

169-T. **Aluminum in 1958 Autos.** *Light Metal Age,* v. 16, Feb. 1958, p. 12-13.

(T21a, T21c, 17-57; Al)

170-T.* **Fuel Elements.** *Power Reactor Technology,* v. 1, Dec. 1957, p. 21-30.

Nuclear performance, neutron absorption, dimensional stability, thermal and other physical properties of fuel elements composed of U, U-Zr, U-Cb, U-Mo, U-Si, U-Pu, Th, Th-U and uranium dioxide. Results of irradiation tests on uranium dioxide fuel elements; addition of beryllia, beryllium, ceria, silica, silicon, silicon nitride, or zirconia. Properties of fuel elements of low fuel content including U-Al, U-Zr, U-Mg and other alloys and dispersions. 22 ref. (T11g, 17-57; U-b)

171-T.* **Other Reactor Materials.** *Power Reactor Technology,* v. 1, Dec. 1957, p. 30-33.

Literature review outlining the mechanical properties and effect of irradiation on control material including boron alloys, cadmium and rare earth dispersions. Moderator, shielding and structural materials including graphite, lithium hydride, magnesium oxychloride, carbon and stainless steel, beryllium and magnesium alloys. 8 ref.
(T11, 17-57, 2-67; Cd, SS, Be, Mg, EG-g)

172-T. (French.) **Copper Roofing: Special Application of Leaded Copper.** *Cuivre Laitons Alliages,* no. 41, Jan-Feb. 1958, p. 11-12.

(T26n, 17-57; Cu)

173-T. (French.) **A Copper Skyscraper.** *Cuivre Laitons Alliages,* no. 41, Jan-Feb. 1958, p. 15-17.

Exclusive use of Cu for exterior and interior. Artificial Cu patina by "Cabra spray process".
(T26n, 17-57; Cu-b)

174-T. (French.) **Copper and Copper Alloys in Industry.** *Cuivre Laitons Alliages,* no. 41, Jan-Feb. 1958, p. 31-33.

(T10c, 17-57; Cu, Cu-n)

175-T. (Polish.) **Some Causes of Damages and Cracks in Rails.** Janusz Lesiecki and Jerzy Rys and Stanislaw Rudnik. *Hutnik,* v. 24, Nov. 1957, p. 457-462.

6 ref. (T23q, 9-72; ST)

176-T. **Are Tool Steels the Answer to High-Speed Flight?** Joseph H. Mainhardt and John P. Wright. *American Machinist,* v. 102, Mar. 10, 1958, p. 106-110.

Preliminary design data on formability, machinability, decarburization control, and heat treatment of hot-work H-11 (5 Cr-Mo-V) toolsteel in both sheet and bar form. Its projected use is for aircraft structures which must meet the basic requirements of strength and temperature resistance. (T24a, 17-57; TS)

177-T. Ceramic Tools Gather Momentum. *American Machinist,* v. 102, Apr. 21, 1958, p. 122-124.

(T6n, G17; 6-70)

178-T. Boron-10, New Atomic Material Available for Commercial Use. *Inco,* v. 27, Dec. 1957, p. 24-26.

Refining and production of B^{10} by reaction of boron trifluoride and di-methyl ether, distillation of the complex, followed by electrolysis. (T11, C-general, 17-57; Ni-b, B)

179-T. Beryllium Research. *Metal Industry,* v. 92, Mar. 28, 1958, p. 255-256.

Research on Be as a possible fuel-canning material. Toxic properties demand stringent precautions. (T11g, 17-57, A7q; Be)

180-T.* Cermets in Jet Engines. J. W. Graham and W. F. Zimmerman. *Metal Progress,* v. 73, Apr. 1958, p. 108-111.

Despite the extensive experimental work in the last ten years, cermets, because of their inherent low impact strength, have not proved suitable for jet engine components. Since substitutes with the needed properties have become available, research work on cermets is now confined to basic principles. (T7h, 17-57; SGA-h, 6-70)

181-T. Nylon-Clad Sleeve Bearings. D. L. Penney and F. J. Bockhoff. *Product Engineering,* v. 29, Mar. 3, 1958, p. 52-54.

(T7d, 17-57; NM-d, 8-66)

182-T. Production of Ball and Roller Bearings. Methods Employed by the Hoffmann Manufacturing Co., Ltd. *Machinery (London),* v. 92, Apr. 4, 1958, p. 779-782.

(T7d, G-general)

183-T. Tungsten Carbide Lamination Die. *Machinery (London),* v. 92, Apr 4, 1958, p. 783-784.

(T6r; 6-69, W)

184-T. Economies Obtained by Using Extruded and Die Cast Aluminum Parts. Herbert Chase. *Machinery (London),* v. 92, Apr. 4, 1958, p. 798-800.

(T21b, 17-57; Al, 4-58, 5-61)

185-T. Exotic Metals Seek Employment. Annesta R. Gardner. *Product Engineering,* v. 29, Mar. 17, 1958, p. 66-70.

Gallium, indium, bismuth, beryllium, chromium, vanadium, hafnium, columbium and rhenium for special structural and electrical problems requiring special properties. (T1, T26, 17-57, Q-general; Ga, In, Bi, Be, Cr, V, Hf, Cb, Re)

186-T. Nonferrous Role in "Birds". *Steel,* v. 142, Apr. 14, 1958, p. 96-97.

U. S. missile program. (T24e, 17-57; Al, Mg, Ti, Be, Cu)

187-T. (French.) Applications of Molybdenum and Its Compounds in the Chemical Industry. (Continued.) H. Beduneau. *Revue des Produits Chimiques,* v. 61, Jan. 31, 1958, p. 3-7.

49 ref. (To be continued.) (T29, 17-57; Mo)

188-T. (German.) Aluminum, New Application Possibilities. H. A. Kirsch. *Chemische Rundschau,* v. 11, Jan. 1958, p. 1-4.

Aluminum as a construction material and its application in the manufacture of large equipment. (T26, 17-57; Al-b)

189-T. (German.) Aluminum and Copper for Long-Distance Cable Lines. H. Mors. *Metall,* v. 11, Nov. 1957, p. 949-954.

Designs for the masts and clamps for high-voltage power transmission. (T1b, 17-57; Al-b, Cu-b)

190-T. (German.) Manufacturing Aluminum Sheathed Cables. H. D. Feldmann. *Metall,* v. 12, Mar. 1958, p. 204-208.

Object of sheathing cables. Lead is more resistant to corrosion than aluminum. Advantages of Al include lower specific weight, higher mechanical strength, high conductivity, which permit economies in production and transport costs. (T1b, 17-57, Al)

191-T. Conference on Aircraft Manufacture. *Light Metals,* v. 21, Apr. 1958, p. 118-123.

Papers from conference on "Problems of Aircraft Production" by Institution of Production Engineers. (T24, 17-57; EG-a39)

192-T. Aluminum in Rockets and Missiles. Don Fabun. *Modern Metals,* v. 14, Apr. 1958, p. 30-44.

Results of recent survey of Al usage in 60 missile programs reflect applications, advantages, limitations of the metal. (T24e, 17-57, Al)

193-T. Big Role for Magnesium in Missiles. *Modern Metals,* v. 14, Apr. 1958, p. 46-52.

Uses of Mg in current missile production, possible potentials, making fullest use of physical properties. (T24e, 17-57; Mg)

194-T. Outlook for Titanium in Missiles. R. C. Durstein. *Modern Metals,* v. 14, Apr. 1958, p. 64-65.

(T24e, 17-57; Ti)

195-T. This Bolt Holds Better. *Steel,* v. 142, Mar. 31, 1958, p. 82-83.

Knurled shank cold works bolt hole and greatly improves resistance to shear in bolted joints. Lab tests and first applications indicate some reduction in labor costs. (T7f, Q27a)

196-T. (Czech.) **Manufacture of High-Quality Seamless Tubes for Petroleum and Geological Research.** Osvald Pejcoch and Josef Cerveny. *Hutnické Listy,* v. 13, Jan. 1958, p. 2-9.

Manganese alloy steel tubes are given a special normalizing treatment. 10 ref. (T28p, J24; *Mn,* AY)

197-T. (Czech.) **Breakdown of Welded Bridges in Belgium.** J. Sevcik. *Zvaranie,* v. 7, Jan. 1958, p. 15-18.

(T26p, 7-51, 9-71)

198-T. (French.) **Metalloplastic Thread.** Maurice Victor. *Revue de l'Aluminium,* v. 35, Jan. 1958, p. 67-72.

Aluminum thread coated with transparent acetate film is low-cost, corrosion resistant, smooth, colorfast, versatile, lightweight. Can be reduced to a 0.0078 in. width. (T10, 17-57; Al-b)

199-T. Zircaloy Tube for Nuclear Power: Extrusion and Coldworking Present Many Problems. J. S. Rodgers. *Canadian Metalworking,* v. 21, Apr. 1958, p. 24, 26.

(T11q, F24, G-general, 1-67, 17-57; Zr-b)

200-T. Replacing Heavy Metal Castings by Light Alloy Castings. Hermann Kessler. *Light Metals,* v. 21, Feb. 1958, p. 57-59. (From *Giesserie,* v. 42, 1955, p. 307-309.)

Previously abstracted from original. See item 104-T, 1955. (T-general, Al)

201-T. Production of Ball and Roller Bearings. *Machinery (London),* v. 92, Mar. 1958, p. 640-652.

Methods and equipment at Hoffmann Mfg. Co., Chelmsford, Essex; use of stainless steel, mild steel and brass. (T7d, 17-57; SS, CN, CU-n)

202-T. Semiconductors—Revolution at Your Elbow. *Product Engineering,* v. 29, Apr. 14, 1958, p. 60-63.

Use of semiconductors for transistors, solar cells, rectifiers, thermoelectric junctions, thermistors and electroluminescent panels. (T1, 17-57; EG-j)

203-T. Preview of Space Age Metals. *Steel,* v. 142, May 5, 1958, p. 86-87.

Tables indicating major airframe components and their alloys, major jet engine components and their alloys, major missile components and their alloys. (T24; 17-57)

204-T.* Molybdenum for Aircraft Gas Turbine Applications. R. T. Begley. Paper from "The Metal Molybdenum", American Society for Metals, p. 408-419.

Main advantages of Mo and Mo-base alloys for jet engine applications are excellent high-temperature strength, good fatigue properties, high modulus of elasticity. Disadvantages are lack or oxidation resistance, relatively high density, difficulty of obtaining high-strength joints. (T24b, 17-57; Mo)

205-T. (French.) **Light Metal Coating of Auxiliary Dams at Rheinaus Hydroelectric Plant.** R. Vogtlin. *Aluminium Suisse,* v. 7, Nov. 1957, p. 212-218.

(T26s, 17-57; EGa-39, 8)

206-T. (French.) **Aluminum and Its Application in Dams.** Lothar J. Streuli. *Aluminium Suisse,* v. 7, Nov. 1957, p. 219-224.

Light weight, resistance to wear and corrosion properties of Al have led to its replacing wood and steel. (T26s, 17-57; Al)

207-T. (French.) **Light Metal Lock Gates.** Ernst Amstutz. *Aluminium Suisse,* v. 7, Nov. 1957, p. 225-229.

Locks for dams made partly of Al alloys resist galvanic corrosion. (T26s, 17-57, R1a; Al)

208-T. (French.) **Lead Pipes in Chemical and Construction Industries.** J. Chauvin. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 359-361.

(T26, T29, 17-57; Pb, 4-60)

209-T. (French.) **Aircraft Production Techniques in French Plants.** Paul Badré. *Metallurgie et Construction Mecanique,* v. 90, Mar. 1958, p. 181-193.

(T24)

210-T. (French.) **Possibilities Offered by Light Metals in Automobile Decoration.** Charles Guinard. *Revue de l'Aluminium,* v. 35, Mar. 1958, p. 303-309.

(T21a, T21c, 17-57; Al, Mg)

211-T. (Russian.) **Solution of Problems of Rail Steel.** D. S. Kazarnovsky. *Stal',* Feb. 1958, p. 138-144.

Lengthening the life of rail steel by means of heat treatment of car-

bon steel rails, use of alloy steels for most strained sections of tracks and improvement of rail shape. 17 ref.
(T23g, J-general, 17-51, 17-57; AY, CN)

212-T. Stainless Steels for the Petroleum Industry. A Comparison of British and American Qualities. F. A. Kirk and J. Williams. *British Petroleum Equipment News,* v. 6, no. 3, 1957/1958, p. 40-46.

(T29n, 17-57; SS)

213-T. The Motor Coach and Aluminum. Leonard C. Rowe. *Corrosion,* v. 14, Apr. 1958, p. 163t-164t.

(T21d, 17-57; Al-f)

214-T. Use of High Strength Steel to Lighten Supersonic Aircraft. Bruce Mitchell. *Industrial Laboratories,* v. 9, Mar. 1958, p. 61-66.

High-strength steel can be used both for structural and nonstructural parts with savings in weight of more than 25% over past design with Al on Ti. This saving is possible because full strength of material can be used.
(T24, 17-57; ST, SGB-a)

215-T. Steel-Foil Corrugated Panels for Lightweight, High-Strength Structures. Bruce Mitchell. *Machine Design,* v. 30, Feb. 20, 1958, p. 179-181.

Use for airframes.
(T24a, 17-57; ST, 4-56)

216-T. 1958 Missile Materials Review. Alfred J. Zaehringer and Raymond M. Nolan. *Missiles and Rockets,* v. 3, Mar. 1958, p. 69-75.

Industry use and development of present and future materials.
(T24e; 17-57, SGA-h)

217-T. Aluminum: For Missiles in Production. Don Fabun. *Missiles and Rockets,* v. 3, Mar. 1958, p. 85-87.

(T24e, 17-57; Al-b)

218-T.* Metallurgical Problems in Fabrication of Zirconium-Clad Fuel Elements for Pressurized Water Reactors. R. B. Gordon. *Nuclear Science and Engineering,* v. 3, Mar. 1958, p. 232-249.

Fabrication of a variety of fuel materials which are compatible with Zr cladding. Homogeneity and melting crucible problems still exist with some of the fuel alloys. Zr-clad fuel elements of the bonded type are produced by pack rolling or coextrusion of the fuel and cladding. Unbonded fuel elements; dimensional control and welding. 5 ref. (T11g, 17-57, L22; Zr)

219-T. The Steel Sandwich. Howard S. Orr. *Pacific Factory,* v. 89, Mar. 1958, p. 48-52.

Production of thin stainless and alloy steels to meet light-weight needs of aircraft and missile construction. (T24a, 17-57; SS, 7-59)

220-T. For the Widest Variety of Industrial Jobs Use Powder Metallurgy Gears. *Powder Metallurgy Quarterly,* Spring 1958.

With new techniques, improved powders, sintering furnaces and presses, powder metallurgy is fast becoming a method of choice for producing heavy structural parts with close tolerances, high strength and shock resistance, at substantial cost savings.
(T7a, 17-57, H-general, 6-72)

221-T. Fasteners for Non-Ferrous Castings. *Precision Metal Molding,* v. 16, May 1958, p. 56-58.

Inserts, tapping screws, nuts, retaining rings and pins.
(T7f; 5-61, 5-63, EG-a38)

222-T. Germanium and Silicon Take the Lead Among Semiconductor Rectifiers. Raymond A. York. *Product Engineering, Design Edition,* v. 29, May 12, 1958, p. 89-91.

(T1, 17-57; Ge, Si)

223-T. Missile Production Requires New Techniques. Frank R. Swaney. *Tool Engineer,* v. 40, May 1958, p. 81-84.

Machining, welding and cleaning operations.
(T24e, G17, K-general, L-general)

224-T. A Brief Study of the Suitability of Titanium and a Titanium Alloy as Firewall Material. C. A. Hughes. Civil Aeronautics Administration. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131392, Sept. 1957, 10 p. $.50.

(T24a, Q-general, 2-62, 17-57; Ti)

225-T. Status of High-Strength Steels for the Aircraft Industry. R. J. Nekervis, C. H. Lund and A. M. Hall. Battelle Memorial Institute. *U. S. Office of Technical Services,* PB 121639, Jan. 1958, 106 p. $2.75.

(T24a, 17-57; ST, SGB-a)

226-T. Coiled Stainless Steel Tubing. Pt. 1, 2. J. J. Chmura, Jr., R. D. Stouffer, A. N. Winter, J. T. Hudson and L. F. Freitag. Martin Co. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131719, PB 131720, Dec. 1957, 2 v. 181 p. $4.

Seamless ¼-hard stainless steel best for coiled applications; instruc-

tion for designers in using metal tubing to solve problems requiring flexibility or relative motion in aircraft systems. (T24d, Q-general; SS, 4-60, 17-51, 17-57)

(T7d, 17-57; SGA-c)

270-T.* PH Stainless for Hot Airframes. R. W. White. *Metal Progress,* v. 73, June 1958, p. 74-78.

Thermal problems of airframes which arise from aerodynamic and engine heating are becoming more severe. Sheet materials getting the most consideration for applications in skins and subsurface components are precipitation hardening stainless steels and Ti alloys. Use of PH stainless in aircraft and missile structures is increasing and the future is expected to bring many more applications. Ease of fabrication is a big point in their favor. (T24a, 17-57, J27; SS, 4-53)

271-T.* Needed: Facts on Space Age Metals. *Steel,* v. 142, June 16, 1958, p. 102-104.

Chicago ASM symposium on aircraft included: a stress-temperature chart of where metals are today with best alloy of each system; program for research suggesting evaluation of present materials under simulated space conditions; verification of laboratory results with materials and in defining space environments; variation of material strength between observation and theory; maximum use of total properties; developing composite materials; discussion of missiles, skin temperature, solid fuels, metal fuels, engines, refractory metals, Ti, Mg, Al and Be. (T24, 17-57, Q-general)

272-T. Survey of Basic Engineering Metallurgy Research Programs of the Division of Reactor Development. J. M. Simmons. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, TID-7546, p. 3-8.

Five major areas of investigation covered by this program: fuel elements (plutonium, advanced types of fuel, fuel for high-temperature operation); metals, alloys and materials; components and equipment; control rods; production techniques. (T11, 17-57)

273-T. Fuel Dispersion in Stainless-Steel Component for Power Reactors. J. E. Cunningham, R. J. Beaver and R. C. Waugh. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, TID-7546, p. 243-268.
26 ref. (T11g, 17-57; SS)

274-T. Fuel Dispersions in Aluminum-Base Elements for Research Reactors. J. E. Cunningham, R. J. Beaver, W. C. Thurber and R. C. Waugh. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, TID-7546, p. 269-297.

Potential methods for incorporating U^{235} fuel enriched to the 20% level, into Al plate type elements for service in high-performance research reactors. 15 ref.
(T11g, 17-57; Al, *Si,* U)

275-T. The Metallurgy and Fabrication of Uranium-Alloy Fuel Elements. R. W. Dayton. Paper from "Fuel Elements Conference", U. S. Office

of Technical Services, T1D-7546, p. 302-365.

Alloy types include the so-called "alpha-prime" alloys (containing 3 to 7% Cb and Zr), gamma-phase alloys (10 to 20% Mo or Cb), and epsilon-phase alloys (3.8% Si or 45 to 80% Zr). Alloy preparation by induction and arc melting, cladding the fuel alloys by brazing, roll bonding and pressure bonding. 87 ref. (T11g, 17-57, C5, L22; U-b)

313-T.* **Out-of-Pile Dynamic Loop Tests of Irradiated Fuel Materials.** L. A. Waldman and W. T. Lindsay. *Bettis Technical Review*, WAPD-BI-7, Mar. 1958, p. 1-15.

An extended series of dynamic tests of clad and defected pre-irradiated specimens of U-Mo alloy and UO_2 fuel materials carried out in out-of-pile loops. The tests contrasted the major difference in the behavior of alloy and oxide fuel material during failure of fuel elements. Results demonstrated considerable stability of the UO_2 specimens and showed that long-lived fission products are not easily leached from either high or relatively low density UO_2. (T11g; U, Mo)

314-T.* **The Use of Titanium as a Corrosion Resistant Material in Chemical Engineering.** *Corrosion Prevention and Control*, v. 5, June 1958, p. 37-39.

Used for gas/water nozzles handling sea-water saturated with SO_2 and operating in hot gas containing SO_2, titanium was untouched after 15 months' service, as compared with the short life of silicon-iron. Where Ti has replaced low-alloy and stainless steels for making certain gas compressor valve plates and springs, no failure has so far occurred after more than 18 months' continuous service. Other Ti components in service include thermo-pockets, stirrers, heating and cooling coils, wire meshes and filter plates and pump impellers. (T29, R4b, R7k; Ti-b)

319-T. High-Strength Structural Sandwich Construction. W. E. Dirkes. Digest from "ASME Design Engineering Conference Paper 58-MD-10", *Mechanical Engineering*, v. 80, July 1958, p. 72-73.

Principal benefit of sandwich construction gives a greater section modulus per unit of density than a conventional beam or panel of solid material. Also, maximum moment developed is resisted by high tensile stress and high compressive stress in the faces.
(T-general; 7-59)

320-T.* **Metallurgical Factors in the Design of Hydraulic Equipment for Elevated Temperature Application.** A. Mars and N. M. Lazar. Digest from "ASME-ARS Joint Aviation Con-

ference Paper 58-AV-11", *Mechanical Engineering*, v. 80, July 1958, p. 75.

Factors controlling the use of metals in the temperature range 400 to 900° F. For high stressed and wear parts, toolsteel-grade steels show promise. Cast irons show satisfactory structural stability in the temperature range for some wear applications and for structural parts and bodies. Nonferrous alloys must be selected with great care, since the temperature range of their usefulness is limited.

Different types of materials developed for resisting high temperatures and corrosion. (T-general, R-general, 2-62, SGA-g, SGA-L)

326-T.* (French.) **Work in France on Production and Study of Large-Size Fittings in Titanium Alloy.** El Gammal. *N. A. T. O. Consulting Commission on Aircraft Research and Manufacture, Report* 97, Apr. 1957, 44 p.

Production and design studies carried out on "piano" wing fittings of SO 4050 Vautoir II. Tests on cut-out sections provided data on usual tensile properties and their variation at low temperatures, fatigue strength, effect of stress-relieving heat treatment, strength of notched test pieces under constant load. Although mechanical properties still need improvement, it appears possible to use Ti alloy fittings on transonic aircraft.
(T24a, 17-57, Q-general; Ti-b)

327-T. Ceramic Tooling. *Aircraft Production*, v. 20, July 1958, p. 274-282.

Use of ceramic cutting tips in commercial practice results in savings over conventional methods.
(T6n; SGA-5, 6-70)

328-T. The Behavior of Sliding Bearings. R. A. Langdon. *Tooling and Production*, v. 24, July 1958, p. 38-41.

Slide designs should be restudied in light of our present knowledge of materials and slide mechanics. Higher cost of newer materials can be offset by reduction of machining time required to prepare them and by the fact that wear and consequent replacement of costly parts is reduced. (T7d, Q9)

329-T. Investigation of Chromium-Manganese Austenitic Steels. A. S. Panicheva. *Metallovedenie i Obrabotka Metallov*, May 1958, p. 23-27. (Henry Brutcher, Altadena, Calif., Translation no. 4219.)

Study to determine usefulness of Cr-Mn austenitic steels for bolts in superheated steam installations. Steel No. EI 729 meets the requirements of high yield point, heat resistance and satisfactory machinability. After 1000 hr. aging at 550-650° C., its shock resistance is stabilized at 4.5 kg. per sq. cm. 10 ref. (T7f, Q-general, 261; SS)

394-T. (French.) **Casting of "55" Air-brake Distributor.** Andre Chevrier. *Revue de l'Aluminium,* no. 255, June 1958, p. 663-668.

Complexity of Westinghouse compressed air brake distributor requires high accuracy in casting and assembling. (T23s, E11, Al, 5-60)

395-T. (Polish.) **Steel-Aluminum Trolley Wires for Transportation Systems.** Leszek Godecki. *Hutnik,* v. 23. Sept. 1956, p. 340-343.

Previously abstracted from original. See item 11-T, 1957.
(T1, 17-57; Al, ST)

396-T. (German-French.) **Durable Thread Inserts for Light Metal.** *Aluminium Suisse,* v. 8, no. 2, Mar. 1958, p. 67-68.

Uses of "Heli-Coil" Cr-Ni steel threading inserts. (T7f; AY, *Cr, Ni*)

397-T. (Book.) **Lubrication of Bearings.** F. T. Barwell. 292 p. 1956 Butterworths Scientific Publications. 88 Kingsway W.C. 2, London.

Modes of lubrication, wear and its mechanisms, viscosity, principles of hydrodynamic lubrication, journal bearings subject to variable loading, thrust bearings, concentrated contact bearings, externally pressurized bearings, reciprocating sliders and oscillating bearings.
(T7d, 18-73; NM-h)

398-T. (Book.) **Nuclear Reactor Metallurgy.** Walter D. Wilkinson and William F. Murphy. 382 p. 1958. D. Van Nostrand Co., Inc., 120 Alexander St., Princeton, N. J. $5.60.

Introduction for engineers and students. Covers production of uranium metal from ores; structure and properties of U; U alloys; heat treatment, fabrication, powder metallurgy, corrosion, surface protection of U; metallurgy of Pu, Th, Be, Zr; properties of liquid metals and ceramics; effects of neutron radiation on nonfissionable metals and alloys; nondestructive testing of reactor components.
(T1l, 17-57; Be, Pu, Th, Zr, 17-67)

399-T. Steel Castings in Airframes. John K. Dietz. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 17-20.

Most feasible method of fabricating a complex shape is to cast it to its final configuration. Yet extended application of castings is being hampered by difficulties currently being encountered. These include low and nonuniform tensile properties; dimensional problems; defects in critical areas; slow delivery. Optimum techniques are recommended. (T24a, 17-57; ST, 5-60)

400-T. Materials for Hypersonic Weapons. J. J. Russ. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 31-40.

High-temperature properties of 50 special alloys. Forgeability index numbers, maximum tensile strength, tempering and aging temperatures and maximum usable temperatures are tabulated.
(T24, 17-57, F22, Q-general, 2-62, 17-52)

401-T.* (German.) **Further Development of Lead-Magnesium Bearing Metals.** Hellmuth Seliger. *Freiberger Forschungshefte,* no. B28, 1958, p. 5-20.

Effect of Mg on Pb-bearing alloys. New alloy is superior to known Sn-Pb bearing metals; has greater smoothness, corrosion and heat resistance. Hardening constituents (chiefly Ca and Na) are added to Mg-Pb alloy by electrolytic deposition; properties are improved by heat treatment. (T7d, 17-57; Pb, *Mg*)

402-T. Structural and Vibrational Characteristics of WADC X-1, X-2 and X-3 Model Propeller Blades. J. E. Carpenter, F. W. Stutzman and E. M. Sullivan. Cornell Aeronautical Laboratory, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131239, Jan. 1957, 181 p. $4.75.

Propellers are 5-ft. diameter, three-bladed configurations designed for use in supersonic aircraft. Special test equipment was modified to include a camera installation for photographing the blade tip during rotation. Experimental data included the steady strain distribution at rotational speeds to 5800 rpm. produced by centrifugal force, blade natural frequencies, changes in blade tip pitch angle with rotation, vibratory strain distributions, and blade damping characteristics. Blade vibratory characteristics, in both bending and torsion, were analytically determined. (T24, S21)

403-T. Structural and Vibrational Characteristics of Scale Model Supersonic Propeller Blades. M. O. Burquest and J. E. Carpenter. Cornell Aeronautical Laboratory, Inc. (Wright Air Development Center.) *U. S. Of-*

fice of Technical Services, PB 131426, Aug. 1956, 70 p. $2.

Test blades as large as 8 ft. in diameter are instrumented with wire resistance strain gages and rotated in a steel shell evacuated to less than 1% of atmospheric pressure. Test data are obtained at rotational speeds up to 8000 rpm. at any positive or negative blade angle setting. Excellent correlation was obtained between the experimental and analytical results.
(T24, S21)

404-T.* (Japanese.) **Atomic Power and Metals: Beryllium and Its Oxide.** Hiroshi Makatani. *Metals,* v. 28, July 1958, p. 505-507.

Be has remarkable characteristics which are desirable for an atomic pile; small mass, mechanical strength, stability under collision with high energy neutrons, durability, large scattering cross section. Chemical, physical and mechanical properties, deposits in Japanese extraction and refining.
(T11, 17-57, P18; Be)

405-T. Metallurgical Problems in Molten Fluoride Systems. W. D. Manly, J. H. Coobs, J. H. DeVan, D. A. Douglas, H. Inouye, P. Patriarca, T. K. Roche and J. L. Scott. *Second United Nations International Conference on the Peaceful Uses of Atomic Energy,* A/CONF.15/P/1990, U. S. A., June 1958, 30 p.

Use of nickel-base alloys and austenitic stainless steel as construction materials for containing molten fluorides. 7 ref.
(T11, 17-57; Ni-b, SS-e)

406-T. Tool Engineering for the Space Age. T. W. Black. *Tool Engineer,* v. 41, Sept. 1958, p. 73-82.

Space age problems in the aircraft and missile industry and how they are being solved by creative engineering. (T24, G-general)

407-T. A Guide to Nuclear Power. Pt. 3. Metallurgical Problems. W. D. Biggs. *Welder,* v. 27, no. 134, Apr-June 1958, p. 26-29.

Physical properties and types of metals used in construction of various reactor components. Present trend suggests increase in thickness of pressure shell and the use of exotic materials in construction. (To be continued.)
(T11q, K1a, 17-57; SS-e, Cr, Ni)

408-T. Welding Applications at Derby C. & W. Works. Pt. 2. A. E. Bates. *Welder,* v. 27, no. 134, Apr-June 1958, p. 30-34.

Railroad car manufacturer finds welding, where practicable and possible, economical and a very efficient means of fabrication.
(T23p, K1a; ST-b)

409-T. (French.) **Metals for Thermal Reactors.** Marcel Englander. *Mines,* v. 13, no. 2, 1958, p. 167-171.

(T11, 17-57)

410-T. (Italian.) **Selection of Materials for Oil Refining Plants.** *Nickel,* no. 74. June 1958, p. 1-10.

(T29n, R-general, 17-57; Cu-b, Ni-f, ST)

411-T. Rocket Refractories. H. B. Porter. Naval Ordnance Test Station. *U. S. Office of Technical Services,* PB 131503, Aug. 1955, 55 p. $1.50.

Basic refractory substances, including metal oxides, metal-metalloid compounds, and intermetallic compounds, both individually and as ingredients of bonded-ceramic and cermet compositions. Use of refractories as protective coatings, combustion chamber liners and nozzles, with special emphasis on commercial materials. Design and fabrication, physical and chemical properties, manufacturers and products.
(T2p, 17-57; 6-70; RM-h, NM-f)

412-T.* (English.) **Production of Enameled Steel Storage Tanks. Construction of a New Plant With a High Degree of Mechanization.** Jan Holub. *Czechoslovak Heavy Industry,* no. 8, 1958, p. 32-38.

Cost and volume analysis of enamelled steel food storage tanks. New automated plant described.
(T26q, W10a, 17-57; ST, 8-71, 18-74)

413-T.* Some Metallurgical Aspects of Pontiac V-8 Engine Pearlitic Malleable Iron Crankshaft. K. B. Valentine. *SAE Transactions,* v. 66, 1958, p. 81-85.

Pearlitic malleable iron is compared with SAE 1046 steel forgings. Modulus of elasticity is less; however, torsional vibration characteristics are similar. Fatigue, hardness and wear properties are satisfactory. Machinability is much better than that of SAE 1046.
(T21b, 17-57, Q-general; CI-s)

414-T.* Problems in the Application of High-Strength Steel Alloys in the Design of Supersonic Aircraft. A. F. Ensrud. *SAE Transactions,* v. 66, 1958, p. 118-136.

Ways to alleviate the intrinsic weight penalties accompanying the use of high-density alloys at ele-

vated temperatures. Primarily, this can be accomplished by the proper selection of materials and the choice of more suitable structural configurations. 16 ref.
(T24, 17-57, 2-62; AY, SGB-a)

415-T.* The Nonnuclear Application of Thorium. W. C. Lilliendahl. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 20-28.

Th metal is utilized as a deoxidant (as for Mo and Fe) and in electronic tubes and lamps for controlling starting voltages and maintaining stability over useful life. An expanding field is the use of Th in W electrodes for heliarc welding where it provides an instant starting arc and arc stability. Th has also found application in the production of sound ductile joints in Mo. 19 ref. (T1j, W29h, 17-57; Th)

416-T. Ways to Keep Fasteners Locked. Federico Strasser. *Iron Age,* v. 182, Sept. 25, 1958, p. 88-91.

417-T. Modern Cutting Tools Save Costs at High and Low Speeds. H. J. Siekman. *Iron Age,* v. 182, Sept. 18, 1958, p. 95-97.

(T6n, 17-57; SGA-j, 6-20, 17-53)

418-T. Foil Clad Laminates in Printed Circuitry. D. K. Rider. *Metal Progress,* v. 74, Sept. 1958, p. 81-85.

Start with an insulating base, glue on very thin Cu foil (free of holes or inclusions) etch away unwanted areas leaving behind conductive paths from point to point. This concept leads to rugged assemblies, mass produced at minimum cost. (T1c; Cu, 4-56)

419-T. Four-Story Welded Frame Designed by the Plastic Theory. M. R. Horne. *Welding and Metal Fabrication,* v. 26, Aug. 1958, p. 278-280.

(T26n; ST, 17-51)

420-T. (Russian.) Role of Iron and Steel Castings in Machine Building. F. Naumann. *Liteinoe Proizvodstvo,* July 1958, p. 30-32.

(T-general, 17-57; CI, ST)

421-T. (Book.) High Strength Steels for Aircraft. 81 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $2.95.

Papers presented at the first Southwestern Metal Congress, Dallas, Tex., May 12-16, 1958. Papers abstracted separately. (T24; ST)

422-T. Motor Industry Extends Use of Anodized Aluminum Trim. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 30-33.

Besides being corrosion resistant, anodized Al can be dyed, and is used for automobile bumpers and trim. (T21, 17-57; Al, 8-73)

423-T.* Sturdy Steels for Springs. *Iron Age,* v. 182, Oct. 16, 1958, p. 186-187.

Performance of a spring is tied to its design and the quality of the steel from which it is made. Spring steels must possess accuracy, ductility, hardenability, finish, high fatigue value and uniformity in response to forming and heat treatment from one lot to another. Tables of standard thickness tolerances, width tolerances for special edges and width tolerances for slit edges. (T7c, 17-57, S22; CN)

424-T.* Designing With Steel for Lighter Aircraft. Bruce Mitchell. *SAE Transactions,* v. 66, 1958, p. 406-413.

One of the better steels for thin sheet applications in light-weight aircraft structure is 17-7PH, because it can be heat treated without scaling. After annealing at 1750° F., it has a yield strength of 45,000 psi. and elongation of 35%. It is transformed at −100° F. after which it has a room-temperature yield strength of 110,000 psi. Final aging treatment is at 950° F. for a room-temperature yield strength of 200,000 psi. and ultimate strength of 240,000 psi. with elongation of 5%. (T24, 17-57, Q27; SS)

425-T.* (French.) Alloys With High Nickel and Chromium Content for Electric Resistances. A. Villachon. *Metallurgie et la Construction Mecanique,* v. 90, Sept. 1958, p. 643-655.

Properties, principal grades, characteristics, methods of test, precautions in use, deterioration, origin of principal impurities, temperature in use, calculation of a heating element, choice of alloys. Wire and strips. 16 ref. (T1p, 17-57; Ni, Cr)

426-T.* (Italian.) Cermets, Ceramics and Protective Coatings for High-Temperature Applications in Jet Propellers. R. M. Corelli. *Aerotecnica,* v. 38, Apr. 1958, p. 71-87.

Production methods, principal characteristics, methods of applica-

tion (in case of coverings), performance. 27 ref.
(T24b, 17-57; SGA-h, 6-70)

427-T. (Czech.) **Welded Edges on Knives for Excavating Equipment for Coal Mines.** Jan Kolar. *Zvaranie,* v. 7, Aug. 1958, p. 234-237.

Experimental use of weld metal with different C, Mn, Si, Cr, W, V, Mo and Co content. Method of welded edges not successful, even when soft and medium hard coal was mined. (T28, 8-68, 17-57)

428-T.* **A Specialist's Way of Making a Way.** O. C. Underhill. *Machinery,* v. 65, Oct. 1958, p. 142-145.

Construction of flat bearings using two different materials to insure accuracy for sliding members in many machine tools. (T7d, W25)

429-T.* (German.) **Can Ceramic Tools Replace Tools of Hard Metal?** F. Kolbl. *Planseeberichte für Pulvermetallurgie,* v. 6, Aug. 1958, p. 48-66.

Ceramics based on aluminum oxide, aluminum oxide with chromium oxide, metals, metal carbides and borides. Properties and cutting speeds. Applications: spinning quartzite and caolinite, cutting hard rubber, lead bronze bearings, plastics, presintered ceramics and gray cast iron. 22 ref. (T6n, 17-57; 6-70)

430-T.* (German.) **Modern Hammer Drills.** O. Muller. *Technische Mitteilungen Krupp,* v. 16, Sept. 1958, p. 66-71.

Weight, number of blows per minute, air pressure, arrangement of water channels. One-piece boring bars and interchangeable boring heads, both with induction welded hard metal bore edges. Sintered tungsten carbide with Co is best. Co content from 7 to 15% determined by hammer type and kind of rock. 8 ref. (T28j; 17-57; 6-69)

431-T. Aluminum Alloys. Ralph L. Horst, Jr. *Industrial and Engineering Chemistry,* v. 50, Sept. 1958, Pt. 2, p. 1427-1432.

New Al-Mg alloys, corrosion, applications in buildings, nuclear reactors, chemical equipment, petroleum refining equipment and transportation equipment. 50 ref. (T-general, R-general, 17-57; Al-b, *Mg*)

432-T. Industrial Material Roller-Bearing Steel and Its Importance for the Production of High-Grade Roller Bearings. A. Naumann. *Technik,* v. 11, no. 11, Nov. 1956, p. 767-772. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. 58-1470.)

(T7d, 17-57; ST)

433-T. AF Pushes Beryllium Studies. Jack G. Conner. *Aviation Age,* v. 30, Sept. 1958, p. 102-109.

Pros and cons of Air Force use of Be for missile and spacecraft. (T24e, 17-57; Be)

434-T. Aluminum in Architecture. A. F. Hare. *Modern Metals,* v. 14, Oct. 1958, p. 40, 43, 44, 46, 48, 49.

Applications, ranging from prefabricated homes and schools to huge domes, aircraft hangars and bridges. (T26n, T26p, 17-57; Al-b)

435-T. Uranium. Pt. 1. Case for Enriched Uranium. Chauncey Starr. *Nucleonics,* v. 16, Aug. 1958, p. 86-87.

Prospects for use of enriched U as reactor fuel. 6 ref. (T11g, 17-57; U)

436-T. Uranium. Pt. 2. Case for Natural Uranium. John R. Menke. *Nucleonics,* v. 16, Aug. 1958, p. 88, 95.

Use of natural U as reactor fuel. 12 ref. (T11g, 17-57; U)

437-T. Thorium. Bernard Manowitz. *Nucleonics,* v. 16, Aug. 1958, p. 91-95.

Use of Th as reactor fuel; Th-U^{233} fuel cycle. 12 ref.
(T11g, 17-57; Th, U)

438-T. Ag-In-Cd Could Replace Hf for PWR Control Rods. I. Coehn, E. F. Losco and J. D. Eichenberg. *Nucleonics,* v. 16, Aug. 1958, p. 122-127.

Ag-In-Cd is easily machined, less costly, suitable corrosion resistance. 7 ref. (T11j, 17-57; Ag, In, Cd)

439-T. Fabrications in Nimonic Alloys With Particular Reference to Jet-Engine Components. *Sheet Metal Industries,* v. 35, Aug. 1958, p. 630-635.

(T24b, 17-57; Ni-b)

440-T. Rapid Evaluation of Cutting Tools. L. B. Zylstra. *Tool Engineer,* v. 41, Oct. 1958, p. 117-118.

By using the facing method of testing with an engine lathe it is possible to quickly compare various cutting tools to see if extensive testing is justifiable.
(T6n, G17, 1-54)

441-T. (German.) **Complex Cutting Tools.** E. Bosse. *Fertigungstechnik,* v. 8, Sept. 1958, p. 393-396.

(T6n)

442-T.* (German.) **Wire as Material for Screens.** Erich O. Riedel. *Draht,* v. 9, Aug. 1958, p. 295-301.

Steels suited for screens and their composition. Survey of the effects of alloying elements on the properties of wire and on the resistance against H_2SO_4, HC_2 HNO_3. Wear testing machine illustrated. Excessive deformation of wire or even notching reduces strength up to 50%. Soldering intersections given preference to welding. Welding should be performed always under a protective gas to avoid decarburization. 5 ref. (T10, R6, Q9; ST, 4-61.)

443-T.* (German.) **Precious Metals and Their Alloys as Materials for Electric Contacts.** H. Holzmann. *Metall,* v. 12, July 1958, p. 630-636.

Requirements for electrical contact materials; various materials available (Cu, Ag, Au, Pt, Pd, Rh, In, B, Mo, and their alloys). Physical and electrical properties of the pure metals and a large number of alloys listed, advantages and disadvantages of the materials evaluated. Galvanic coatings discussed. (T1, 17-57; EG-c31, SGA-r)

444-T.* (German.) **Production of Spring Steel Wire for Motorcycle Springs.** Joachin Olden and Karlheinz Werner. *Neue Hütte,* v. 3, June 1958, p. 358-364.

One heat of spring steel of the type MK 82F was followed from melting furnace to actual tests after assembly on the motorcycle. For comparison Swedish spring steel was subjected to similar treatment. Warm forming, drawing tests, cold forming and coiling tests were carried out. German spring steel had same high-quality properties as Swedish steel. (T7c, 17-57; ST)

445-T.* **Development of Micrograin Nickel.** *Corrosion Prevention & Control,* v. 5, Aug. 1958, p. 56-58.

Micrograin Ni is hard, yet flexible and corrosion resistant. Resistance to abrasion and impact is unusually high, better than Ni deposited from solutions containing organic agents, or stainless steel. Advantages of protecting de-icers with micrograin Ni electroform. (T24a, 17-57; Q9n; Ni)

446-T.* **Rudder Shafts for Missiles Made in Halves and Welded.** Russell Meredith. *Machinery,* v. 65, Nov. 1958, p. 118-120.

Inconel "X" selected because it has good physical and mechanical properties at high temperatures and is highly resistant to corrosion and oxidation. Machining procedure is to slab-mill two forgings at a time on a conventional, horizontal milling machine, then contour-milling the various cavities, welding and heat treating. (T24e, G17, K-general; Ni-b)

447-T.* **Reactor Fuels and Materials Pioneering Work on Oxides and the New Metals.** J. G. Ball. *Nuclear Power,* v. 3, Oct. 1958, p. 477-482.

Some 16 of the papers presented at the 2nd United National, International Conference on the Peaceful Uses of Atomic Energy are digested and analyzed. (T11g)

448-T.* **Boron Containing Control Materials.** D. N. Dunning, W. K. Anderson and P. R. Mertens. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 402-414.

Boron stainless steel, Zircaloy-boron and Ti-B alloys for use in reactors. Fabrication techniques. 5 ref. (T11j, 17-57; SS, Zr, Ti, *B*)

449-T.* **Boron Stainless Steel Alloys.** L. B. Prus, E. S. Byron and J. F. Thompson. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 415-428.

Several boron stainless steels containing 0.2 to 3.0% B investigated for possible use as a reactor control material. Fabrication methods, physical properties, wear and corrosion resistance of the alloys. (T11j, 17-57; SS, *B*)

450-T.* **New Developments in the Fabrication of Hafnium Control Rods.** J. Giacobbe and D. N. Dunning. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 467-480.

Fabrication of strip Hf and strip Zircaloy by welding into suitable shapes applicable for reactor control. (T11j, 17-57; K-general, Hf, Zr)

451-T. **Thorium-Uranium Fuel Elements for SRE.** B. R. Hayward and P. Corzine. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/785, 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

One of major purposes of the Sodium Graphite Thermal Reactor Experiment (SRE) is to develop fuel materials for long burnup at elevated temperature. Development, processing and fabrication of Th-rich, Th-U alloys. Two major alloys were fabricated—5.4% U and 7.6% U. 5 ref. (T11g, 17-57; Th-b, *U*)

452-T.* (French.) **Properties and Applications of a Nickel-Sheathed Copper Wire.** *Revue du Nickel,* v. 24, July-Aug. 1958, p. 65-67.

Bimetallic conductor composed of electrolytic Cu coated with Ni combines high electrical and thermal conductivity of Cu with oxidation resistance and metallurgical properties of Ni; is fabricated in all diameters, with cross section 70% Cu, 30% Ni; is delivered hard or annealed. (T1, 17-57; Cu, *Ni,* 4-61)

453-T. Appraisal of Recent Metallurgical Advances in American Automobile Manufacturing. J. L. McCloud. *Metal Progress,* v. 74, Oct. 1958, p. 130-133.

Among the recent changes and those soon to come in materials for automotive use, the trends toward low-alloy and carbon steels and toward greater use of Al seem the most significant. (T21, 17-57)

454-T. Magnesium: Will It Find Biggest Market in Missiles? Carl N. Mortenson. *Missiles and Rockets,* v. 4, Sept. 8, 1958, p. 46-49.

Examples of the expanding application of ten Mg alloys. (T24e, 17-57; Mg)

455-T. Broad Aspects of Absorber Materials Selection for Reactor Control. W. K. Anderson. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 357-372.

Selection of materials for control of nuclear reactors employing a variety of coolants and working over a broad range of neutron spectra considered from a qualitative standpoint. The materials discussed include hafnium, boron, cadmium, indium, silver, europium, gadolinium and samarium. 11 ref. (T11j, 17-57; Hf, B, Cd, In, Ag, Eu, Gd, Sm)

456-T. Nuclear Requirements for Control Materials. H. E. Stevens. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 373-385.

Nuclear factors affecting the effectiveness of control rod materials for power reactors with a thermal or near-thermal neutron spectrum. Principal elements and isotopes which qualify as neutron absorbers are compared and physical requirements such as rod thickness, surface density and weight ratios noted. 4 ref. (T11j, 17-57, P18)

457-T. Use of Boron Carbide for Reactor Control. W. K. Barney, G. A. Sehmel and W. E. Seymour. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 439-448.

Use of B_4C for the control of a sodium-cooled reactor considered from a design standpoint. Nuclear, mechanical and physical properties and irradiation data. 10 ref. (T11j, 17-57, 2-67; B, 14-68)

458-T. Development of a Composite Control Rod. G. W. Cunningham, A. K. Foulds, D. L. Keller and W. E. Ray. *Nuclear Science and Engineering,* v. 4, Sept. 1958, p. 449-457.

Scarcity and high cost of Hf for use as a reactor control material has led to the development of a composite control rod of Hf and B^{10}. Fabrication techniques. (T11j, 17-57; Hf, B)

459-T. Molybdenum as a Bearing Material. R. H. Warring. *Power Transmission,* v. 27, Sept. 1958, p. 548-550, 554.

(T7d, 17-57; Mo)

460-T. Your Guide to Springs That Store Energy Best. Karl W. Maier. *Product Engineering,* v. 29, Nov. 10, 1958, p. 71-76.

Energy depends on shape and material. Equations and tables that give definite comparisons between many candidates, materials. (T7c, Q-general, 3-73, 2-60)

461-T.* Role of Metallurgy in Atomic Energy Technology. Pt. 2. Fuels for Nuclear Reactors. A. Blainey. *South African Institute of Mining and Metallurgy, Journal,* v. 58, July 1958, p. 609-634.

Possibility of using natural U as a nuclear fuel has great significance for South Africa which has no separation plant for production of U^{235}. (T11g, 17-57; U)

462-T. Research and Development on Ultra-Thermic 500° C. Capacitors. A. L. Berg. Servomechanisms, Inc. (Wright Air Development Center), *U. S. Office of Technical Services,* PB 131848, Apr. 1958, 90 p. $2.25.

Ultra-thermic capacitors for operation to 500° C. were fabricated using successive layers of Pt and dielectric materials deposited by vacuum thermal evaporation. (T1e, L25, 2-61; Pt)

463-T. Feasibility Studies on Molten Metal Reactor Components. Ray W. Fisher and Charles B. Fullhart. Second United Nations International Conference on the Peaceful Uses of

Atomic Energy. A/CONF.15/P/1032, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Molten Mg-Th alloy of composition in the range of the Mg-rich eutectic was circulated in Ta at temperatures up to 800° C. Data indicated that Ta is a satisfactory material for containing molten Mg-Th alloys under temperature conditions that may be imposed on a molten blanket material in a nuclear reactor. 9 ref.
(T11g, 17-57; Mg, Th, Ta)

464-T. Use of Aluminum as Fuel Cladding in High-Temperature Water Cooled Reactors. J. A. Ayres, R. L. Dillon and R. J. Lobsinger. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1430, 1958, 9 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Corrosion rates of Al in high-temperature high-pressure water systems measured both inside and outside of a reactor. Equipment consisted of autoclaves, flow tubes and in-reactor flow loops.
(T11g, R11; Al, 8-66)

465-T. Liquid Metal Fuel Reactor With Recycled Plutonium. F. T. Miles, T. V. Sheehan, D. H. Gurinsky and H. J. C. Kouts. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/461, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Fuel is a solution of the steady state mixture of Pu isotopes in Bi. The solution also contains U^{238}, Mg and Zr as corrosion inhibitors, and fission products. Fuel reprocessing includes degassing and extraction with molten salts, which is designed to keep neutron capture by fission products below 3%. 11 ref.
(T11g, P18; Pu, U, Mg, Zr)

466-T. Recycle of Plutonium in Low-Enrichment Light Water Reactors. P. Greebler, W. H. Harker, J. M. Harriman and E. L. Zebroski. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2167, 1958, 39 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Detailed model of the physics of a reactor operating with recycle Pu fuel. Model takes into account spectral and geometric effects which must be considered for lattices in which the resonance region is important. Modes of operation available with Pu recycle. 19 ref.
(T11g, P18; Pu)

467-T. Material and Fuel Technology for an LMFR. C. J. Klamut, D. G. Schweitzer, J. G. Y. Chow, R. A. Meyer, O. F. Kammerer, J. R. Weeks and D. H. Gurinsky. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2406, 1958, 58 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Materials which can be used in contact with U-Bi fuels in liquid metal fuel reactor systems (LMFR) are graphite, Be, carbon steels, low-Cr steels Mo, Ta, W and some high-alloy steels. Corrosion products resulting from immersion of these materials in U-Bi should not reduce the solubility of U in Bi. 36 ref.
(T11g, R6m; U, Bi, Be, CN, Mo, Ta, W, Cr)

468-T. (French.) **Copper Sheathing in Finnish Architecture.** Erkki Valve. *Cuivre, Laitons, Alliages,* no. 44, July-Aug. 1958, p. 11-15.
(T26n, 17-57; Cu-b)

469-T. (French.) **The New Roof of the Copper Information Center in Paris.** *Cuivre, Laitons, Alliages,* no. 44, July-Aug. 1958, p. 17-19.
(T26n, 17-57; Cu-b)

470-T. (French.) **Copper Cooking Utensils.** *Cuivre, Laitons, Alliages,* no. 44, July-Aug. 1958, p. 21-24.

Strong case for Cu as ideal metal for food preparation. Care and cleaning hints. (T10a, 17-57; Cu-b)

471-T. (German.) **Hexagonal Hard Metal End-Milling Cutter.** Hans-Jorn Burmester. *Industribelatt,* v. 58, Sept. 1958, p. 379-383.

Novel end-milling cutter provided with exchangeable hard metal blades that are discarded after using. Applications: milling of steel, steel castings, gray cast iron. 4 ref.
(T6n, G17b; 6-69)

472-T. (German.) **Platinum Metals Utilized as Catalysts.** J. Sagoschen. *Metall,* v. 12, July 1958, p. 604-611.

Survey of historic development, theory, production methods and applications. 139 ref. (T29d, 17-57; Pt)

473-T. (German.) **Hard Metal Tools for Precision Work.** Hans-Jorn Burmester. *Schriftenreihe Feinbearbeitung*, no. 29, 1958, p. 9-55.

Hard metal precision tools classified as one-edge machining tools, multiple-edge machining tools and tools for plastic deformation. 20 ref. (T6n; 6-69)

SECTION W

PLANT EQUIPMENT

1-W. (German.) **Synthetic Resin Cores.** F. Paschke. *Giesserei Praxis,* v. 75, Sept. 10, 1957, p. 369-373.

Resins available; equipment necessary; operation; advantages; economics. (W19g; NM-f45)

2-W. (German.) **Fabrication of Two Patterns for Rolling Mill Housings.** Friedrich Lamm. *Giesserei,* v. 44, Aug. 29, 1957, p. 520-522.

Report No. 2 of the Technical Committee on "Pattern Making" of the Verein Deutscher Giessereifachleute; pattern design; cost analysis. (W23m, 17-51; ST)

3-W. (German.) **Steel Structure in Power Industry.** Fritz Reinitzhuber. *Schweisstechnik,* v. 11, July 1957, p. 73-80.

Pressure conduits and shafts; harbor constructions; hydro-power stations; steel poles; development of arc welding technique. (W11, 17-57, K1; ST)

4-W. (Russian.) **Improved Location of Blast Furnace Mixing Valves.** N. N. Chernov, I. F. Domnitskii and I. A. Suchkov. *Stal',* v. 17, May 1957, p. 389-391.

By placing the mixing valves between the blast furnace and the first stove the performance of the hot blast brick lining was considerably improved and the mixture of cold and hot air became satisfactory. (W17g, 1-52; RM-h, Fe)

5-W. (Russian.) **Comparison of Tilting and Stationary Openhearth Furnaces.** V. V. Leporskii, E. A. Kapustin, G. M. Glinkov and P. N. Slepkanev. *Stal',* v. 17, May 1957, p. 411-413.

In view of the ever-broadening use of high-phosphorus ores and ores with alloying constituents, the authors compare the characteristics of the two types of furnaces. 5 ref. (W18r, 1-52; ST, RM-n)

6-W. (Russian.) **Determination of Minimum Power Consumption in the Electric Arc Furnace.** N. A. Markov. *Stal',* v. 17, May 1957, p. 419-424.

Mathematical analysis of power consumption and other performance data. 8 ref. (W18s, 16-61)

7-W. (Russian.) **Improved Pass Design for Cold Rolling Pipe.** Yu. F. Shevakin, Ya. E. Osada, O. A. Semenov and F. S. Seidaliev. *Stal',* v. 17, May 1957, p. 441-444.

The Moscow Steel Institute has developed a method for designing rolls for cold rolling pipe (or tubes) which combines the most favorable gorge angle with advantages resulting from rolling pipe on low-taper mandrels. 5 ref. (W23k, 17-51; 4-60)

8-W. (Russian.) **Production of Rolls With Cast Profiles.** A. E. Krivosheev and B. B. Ezerskii. *Stal',* v. 17, July 1957, p. 663-665.

Method is claimed to be the only successful one in the world for manufacture of durable cast rolls. 3 ref. (W23k, E general; CI)

9-W. **New Mill Ups Tube Production.** *Steel,* v. 141, Nov. 18, 1957, p. 214-215.

Automatic tubemaking featuring outsize drawbench. (W18h, 1-52; Cu)

10-W. (Czech.) **Quality Improvement of Lubricating Asphalt for Roll Necks in Rolling Mills Designed for Thin Sheet.** Bohuslav Otta and Josef Teindl. *Hutnicke Listy,* v. 12, Sept. 1957, p. 803-808.

21-W. Silicone Lubricants for the Steel Industry. W. H. Ragborg and W. H. Badger. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 105-108.

Properties of silicone fluids, silicone greases and application of silicone in the steel industry. (W10; NM-h)

22-W. Revaluation of the 84-In. Plate Mill Modernized at Alan Wood. Frank J. Bampton. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 113-116.

(W23b; ST)

23-W.* Bottoms for Basic Open Hearth Furnaces. Stephen Wortman. *Iron and Steel Engineer,* v. 34, Nov. 1957, p. 127-133.

Construction and maintenance; types of hearth construction; materials commonly used. (W18r, 1-65; RM-h)

24-W. Electric Drive Systems for Bar and Rod Mill Shears. A. J. White and J. A. Read. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 166-173.

General information on operation of shear; need for balance between design of shear and its electrical drive problems. (W23d, F29q, 1-53)

25-W. Proposal for a Self-Lining Blast-Furnace. W. A. Archibald, T. P. Brown and L. A. Leonard. *Iron and Steel Institute, Journal,* v. 187, Sept. 1957, p. 32-45.

Studies of flow of granules through blast furnace by means of models, proposed system of blast furnace construction to counteract wear, scaffolds and hanging. Characteristics of this design are water-cooled shafts to take advantage of

refractiveness of burden and stack tuyeres. 5 ref. (W17g; ST)

26-W.* Low-Shaft Blast Furnace Adds New Promise. F. Weston Starratt. *Journal of Metals,* v. 9, Nov. 1957, p. 1432-1434.

Basic idea of the Demag-Humbolt furnace is the simultaneous carbonization and reduction of briquettes made of a mixture of proper composition—ore fines and finely ground ores, fluxes and noncoking bituminous coal with 30 to 35% volatile matter to meet the demands of the desired type of pig. (W17h, 1-52; CI-a)

27-W.* Rotor Steelmaking Process. Rudolf Graef, Walther Dick and Ludwig Von Bogdandy. *Journal of Metals,* v. 9, Nov. 1957, p. 1435-1439.

Rotary furnace at Oberhausen, Germany, is sufficiently large to receive the whole tap of the adjoining blast furnace, amounting to 60 tons. Estimated capital and operating costs; future prospects. 3 ref. (W18b, 1-52; ST)

28-W.* Case Studies in Cast and Rammed Arc-Furnace Roofs. J. D. McCullough. *Journal of Metals,* v. 9, Dec. 1957, p. 1521-1524.

Monolithic constructions in center sections of arc-furnace roofs have proven a practical method of reducing refractory roof costs, offering maximum economy when either rammed or cast. Avoiding laminations and insuring volume stability are important considerations. (W18s; RM-h, ST)

29-W. Analysis of Arc Furnace Control. J. H. Kogen. *Journal of Metals,* v. 9, Dec. 1957, p. 1525-1528.

Arc current and arc voltage are measured by means of current and potential transformers. An actuator is mechanically coupled to the electrode mast and positions the electrode until the desired balance between current and voltage is obtained. (W18s, T1m, 1-52)

30-W.* Metallurgy of EBWR. Karl F. Smith. *Metal Progress,* v. 72, Nov. 1957, p. 79-83.

Development of first experimental boiling water reactor created several metallurgical problems not previously encountered in atomic energy utilization. In finding solutions, Argonne National Laboratory developed new alloys and new fabricating techniques. (W11p, T11, 17-57; U, Zr, ST, SS)

31-W. New Arc Furnace Has 66-KV. Transformer With On-Load Tap Changing. *Metallurgia,* v. 56, Nov. 1957, p. 242-243.

At the Stocksbridge works of Samuel Fox & Co., Ltd. (W18s, D5; ST)

32-W. Plastic Press Dies Reduce Aircraft Production Cost. Joseph J. Mele. *Modern Industrial Press,* v. 19, Nov. 1957, p. 20-21.

Procedure used in making epoxy forming die. (W24n; NM-d)

33-W. Efficient Casting Is Done Best With Proper Temperature Control Equipment. Nicholas A. Jannetto. *Precision Metal Molding,* v. 15, Dec. 1957, p. 76-79. (W19f, X9; Al)

34-W. New Mill Will Roll Tough Steels. *Steel,* v. 141, Dec. 2, 1957, p. 99-100.

Cogging mill with diamond grooved rolls proves to be best way to roll high-speed steels and superalloys. (W23a, F23n; TS, SS)

35-W. Vacuum Crane Speeds Mill Output. *Steel,* v. 141, Dec. 2, 1957, p. 102-105.

Automatic lift avoids scratches and controls cycling time on stainless steel sheets at Atlas plant. (W12q, F23, 4-53; SS)

36-W. Grinding Wheels Need Care for Best Service and Life. *Welding Engineer,* v. 42, Dec. 1957, p. 74-78.

Inspection, storage, mounting, speed control. (W25s)

37-W. Electric Roller Hearth Furnaces. *Wild Barfield Heat-Treatment Journal,* v. 6, Sept. 1957, p. 10-14.

Equipment, advantages of roller hearth and versatility in heat treating variety of ferrous and nonferrous parts. Common applications include annealing tubes, sections and strips or bars. (W27j)

38-W. Tests Carried Out on Diamond Wire-Drawing Dies. Pt. 2. *Wire Industry,* v. 24, Oct. 1957, p. 945-953.

Assessment of diamond wire drawing dies and their performance in drawing Cu wire. (W24n; Cu, 4-11)

39-W. (French.) Contribution to the Study of Rolling Mill Equipment. Pt. 2. (Continued.) Equipment for Rolling Semifinished Products. G. Grenier. *Echo des Mines et de la Metallurgie,* no. 3508, Sept. 1957, p. 521-523.

Types of equipment used 1920-1935 in U. S. and Europe; present types; comparison of continuous rolling mill and in-line mill, with reference

to operating conditions, equipment, procedure. (To be continued.) (W23)

40-W. (French.) **Several Types of Cowper Heat Accumulators.** D. Sanna and M. Pasquet. *Institut de Recherche de la Sidérurgie,* Ser. A, no. 130, Oct. 1957, p. 1-67.

The heat accumulation is worthwhile as long as the wind temperature required by the furnace is maintained at a moderate value. The cowpers are too powerful for the requirements of blast furnaces. 29 ref. (W17m)

41-W. (German.) **Shallow Millers for Surface Milling.** A. Ringel. *Fertigungstechnik,* v. 7, Aug. 1957, p. 374-378.

Operation, advantages, economy, applications. 2 ref. (W25r)

42-W. (German.) **Design Changes in a Pusher-Type Furnace of a Three-High Mill.** Günther Barth. *Stahl und Eisen,* v. 77, Oct. 1957, p. 1459-1464.

Blast furnace gas firing, automation, instrumentation, measuring by Venturi tubes, construction of preheating furnace. 3 ref. (W20h)

43-W. (German.) **New Wire Rod Mill of the Klockner—Huttenwerk Haspe at Hagen-Haspe.** Arthur Weyel and Hans Weide. *Stahl und Eisen,* v. 77, Oct. 1957, p. 1464-1476.

(W23d, F23)

44-W.* **Walking Beam Furnaces.** K. Roney. *Electrical Review,* v. 161, Sept. 6, 1957, p. 403-407.

Electric furnaces for all types of heat treatment of heavy or bulky parts have system of moving hearth beams. (W27)

45-W. Hydraulic Equipment in Steelworks. Pt. 4. Modern Pumps and Motors. F. B. Levetus. *Iron and Coal Trades Review,* v. 175, Aug. 30, 1957, p. 494-496.

(W13d, W11q)

(W18r, 17-51)

57-W. Heating Unit Debonds and Blues Rotors for Electric Motors. *Industrial Heating,* v. 11, Nov. 1957, p. 2298.

Gas-fired rotary heating unit speeds production to 400 units per hr. (W28r, L14; ST)

58-W. Detroit Steel's New Furnace Installation for Bright Annealing of Cold Rolled Strip. *Industrial Heating,* v. 11, Nov. 1957, p. 2313-2316.

(W27, J23a; ST, 4-53)

59-W. Welding Vs. Melting. R. G. LeTourneau. *Machine and Tool Blue Book,* v. 52, Dec. 1957, p. 134-138.

Tourna melting machine, similar to a squirt welder, greatly increases production. (W29, 1-52; ST)

60-W. Vapour Blasting Equipment for Integrally-Stiffened Wing Panels. R. Furgeson and J. R. Eggum. *Machinery,* v. 91, Oct. 18, 1957, p. 918-919.

Equipment for automatic deburring and blending of wing panels by means of vapor blasting. (W2r, L10c, T21a; Al)

61-W. Heat Checking in Die Casting Dies. H. K. Barton. *Machinery,* v. 91, Oct. 25, 1957, p. 982-990.

Mechanism of heat checking and its influence on serviceability of die casting dies. Design precautions. (W19n, 9-22; ST)

62-W. Plating Hoover Steam-or-Dry Irons. *Product Finishing (London),* v. 10, Nov. 1957, p. 83-86.

Floor plan and operating details of automatic plating machine installed at High Wycombe factory. (W10a, L17, 1-52; *Cu, Ni, Cr)*

63-W. Silicon Rectifiers Improve Features of D-C. Welders. E. F. Steinert. *Welding Engineer,* v. 43, Jan. 1958, p. 38.

(W29a, 1-52)

64-W.* Safeguards Aspects of Reactor Vessel Design. D. R. Miller and W. E. Copper. *Welding Journal,* v. 37, Jan. 1958, p. 22s-26s.

Internal heat generation in structural materials, radiation-induced changes in mechanical properties, thermal shock and strain cycling, and coolant-dissociation effects on corrosion and embrittlement, all present problems which require close attention. 12 ref. (W11p, 17-57)

65-W. Rotary Retort Furnace Duplex Quench Improves Case Hardening of Fasteners. William Schmidt. *Western Metals,* v. 15, Oct. 1957, p. 43-45.

(W27g, J28, T7f; CN, AY, SS)

66-W. Effect of Process Variables Upon the Design of Centrifugal Pipe-Casting Machines. A. A. Mikhel'son. *Stal',* v. 16, no. 4, 1956, p. 348-351. (Henry Brutcher Translation no. 4016, Altadena, Calif.)

Design governed by action of liquid metal on principal parts of centrifugal pipe-casting machine. (W19, E14; 17-51, 4-60)

67-W. Pipe Maker Installs Water-Cooled Cupola. J. H. Rehder. *Canadian Metalworking,* v. 20, Nov. 1957, p. 30-36, 69.

(W18d, E10a, 1-55; CI)

68-W. Semi-Continuous Casting Made Easy. *Canadian Metalworking,* v. 20, Nov. 1957, p. 50-52.

Simple machine, replacing hydraulic system of casting, may bring continuous casting of nonferrous slabs and billets into wider use. (W19f, C5q, 4-52; Al, Mg)

69-W. Convector Oven or Infra-Red Radiation? M. Reeves. *Industrial Finishing (London),* v. 9, Oct. 1957, p. 852-857.

Conveyor-type ovens for baking and drying metal finishes; compares relative merits of convection and infra-red radiation. (W4k)

70-W. Mechanical Presses. Their Selection, Design, and Function. Pt. 1. *Modern Industrial Press,* v. 19, Oct. 1957, p. 43-50.

Procedure for determining correct size, capacity and operating speeds of a press. Difference between single and double presses and type of stamping each is suited to. (To be continued.) (W24g)

71-W. (Russian.) The Leningrad Stalin Metal Plant. A. I. Chizhik. *Metallovedenie i Obrabotka Metallov,* no. 11, Nov. 1957, p. 66-71.

Parts for steam turbines are made. 27 ref. (W10; W11k; ST)

72-W. (Russian.) Investigation of Performance of Blast Furnace Shaft Carbon Lining. F. A. Khilkevich and S. V. Bazilevich. *Stal',* v. 17, Sept. 1957, p. 769-771.

Carbon lining lasts longer than fireclay lining and heat losses remain the same. (W17g; RM-h39)

73-W.* (Russian.) Application of Electric Integrator in Investigation of Temperature Distribution in Blast Furnace Hearth Bottom and Foundation. V. V. Yushkin. *Stal',* v. 17, Sept. 1957, p. 779-787.

Most efficient drop of temperature of interior surface of the foundation was obtained for fireclay lining spread over carbon lining with resulting low penetration rate of the liquid pig iron. 4 ref. (W17g, D1; RM-h)

74-W. (Russian.) Application of Unburnt Magnesite-Chromite Bricks in Openhearth Furnace Roofs. M. Broit. *Stal',* v. 17, Sept. 1957, p. 792-795.

Openhearth furnace roofs made of unburnt magnesite-chromite bricks last at least twice as long as silica brick roofs. 3 ref. (W18r; RM-h)

75-W. Heat Checking of Ingot Molds. N. I. Pavlovtseva and L. M. Cherkasov. *Stal'*, v. 17, Sept. 1957, p. 800-804. (Henry Butcher, Altadena, Calif., Translation no. 4062.)

Considerable decrease of number of cracks in cast iron ingot molds can be obtained by modification of the cast iron with Cr or Mg. 3 ref. (W19c, 17-57, 9-72; CI, *Cr, Mg*)

76-W. (Book.) Conference on Atomic Energy in Industry, v. 5, 202 p. 1957. National Industrial Conference Board, Inc., 460 Park Ave., New York 22, N. Y. $15.

Metallurgical articles abstracted separately. (W11p, T11, 17-57)

77-W. Induction Hardening Utilizing Frequencies of 2 to 10 Kc/s. Hermann Kuhlbars. *AEG Progress,* v. 3, 1957, p. 99-105.

Factors influencing selection of medium-frequency equipment; machines for static and progressive hardening, with operational details; components and lay-out of a crankshaft hardening plant. (W27k, J2g, T21c, 18-69)

78-W. Induction Heating for Hot Forming. Friedrich Scheffler. *AEG Progress,* v. 3, 1957, p. 109-114.

Thermal, mechanical and economic requirements of modern forging; appliances for induction heating. (W27k, F22)

79-W.* Induction Furnaces. Hans Harbauer. *AEG Progress,* v. 3, 1957, p. 114-123.

Principle of induction furnace; description, operation, application, electrical connection, advantages and disadvantages of channel and coreless furnace. (W27k)

80-W.* Electrical Equipment of Arc Furnaces in the Iron and Steel Industry. Albert Driller. *AEG Progress,* v. 3, 1957, p. 125-138.

Construction, electrical equipment and electrode control systems of 150-ton DEMAG arc furnace. New systems of high-speed automatic electrode control give more uniform energy consumption and greater economy. (W18s, X10, 1-53)

81-W. Electronic Control in Resistance Welding. Albert Gericke. *AEG Progress,* v. 3, 1957, p. 143-148. (W29c, K3)

82-W. Spark Plus Hardens Steel in Russia. I. I. Kichkin. *American Machinist,* v. 10, Dec. 2, 1957, p. 97-99. (From *Vestnik Mashinostroeniia,* v. 36, May 1956, p. 65-68.)

Previously abstracted from original. See item 190-J, 1956. (W28, L24, J28; ST, *Mg, Cr*)

83-W. Large Oven Furnace Program—Controlled for Versatile Heat Treating. Jere N. Helfat. *Industrial Heating,* v. 24, Dec. 1957, p. 2512-2516. (W27, J2g, 18-74)

84-W. Modern Controls for the Iron and Steel Industry. Pt. 1. *Industrial Heating,* v. 24, Dec. 1957, p. 2521-2526.

Abstracts on automatic valves, openhearth, telemetering and remote control, from papers presented at Seventh Conference on Instrumentation. (W18r, X10, X12)

85-W. New Methods in Maintenance of Refractories in Steel Plants. Pt. 2. *Industrial Heating,* v. 24, Dec. 1957, p. 2573-2576.

Improved methods of roof patching of openhearth furnaces. (To be continued.) (W18r, D2, 18-71; RM-h)

86-W. Dust Control. *Iron and Steel,* v. 30, Oct. 9, 1957, p. 536-567.

Variety of processes and equipment in iron and steel industry create fumes and dust. Size and other properties of dust; operation, comparative efficiency and costs of common types of dust and fume control equipment including gravitational, inertial and centrifugal separators, washers, electrostatic precipitators and filtration units. Lists and describes British dust and smoke control plants. (W13c, A8a, 1-52; ST)

87-W. Electrical Equipment for a Modern Rod Mill. E. L. Anderson. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 112-126.

Electrical control equipment and drives at Bethlehem Steel Co., Johnstown, Pa. (W23n, W23d, 1-52; ST)

88-W. Asarco's New Electrolytic Plant at Corpus Christi, Tex. A. C. Jephson and R. E. Allen. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1381-1384.

Zinc plant for treatment of densified fume with capacity of 80 to 90 tons of high-grade Zn daily. Operation including storage and grinding of fume, leaching, purification, electrolyzing and casting. (W18e, 1-52, C19, C23; Zn)

89-W. Stretching the Wings of a DC-8. O. L. Rumble. *Machinery,* v. 64, Jan. 1958, p. 121-124.

A 600-ton press used to contour dihedral brake area of jet-liner wing skins. (W24g, G9, T24a; Al)

90-W. Production Speeded by Cold Extrusion. Karl Sieber. *Metalworking Production,* v. 101, no. 50, Dec. 13, 1957, p. 2215-2219.

German multi-stage press equipped with carbide dies used in cold extrusion of machine parts. (W24g, W24n, 1-52, G5)

91-W. What to Look for in Aging Oven Design. Carl Mayer. *Modern Metals,* v. 13, Jan. 1958, p. 56-57.

Importance of temperature uniformity throughout the oven; design factors making for optimum efficiency. (W27, 1-52, J27d; Al)

92-W. Versatile Automatic Large Oven Furnace. Jere N. Helfat. *Steel Processing and Conversion,* v. 43, Oct. 1957, p. 581-589.

Gas-fired oven furnace with inside dimensions of 6 ft. cubed camactuated program control used for stress-relieving, annealing or normalizing. (W27g, 1-52, J23, J24, J1)

93-W. Single Shift Produces 32 Different Products, 10,000 Aluminum Castings. James Joseph. *Western Machinery and Steel World,* v. 48, Dec. 1957, p. 84-86.

Production is maximized by use of overhead conveyor which insures inspection within 6 min. after casting, reducing high losses of scrap. (W12r, E general, 18-67, 18-74; Al)

94-W. (French.) **Steels for Molds Under Pressure.** M. K. I. Bengtsson. *Fonderie,* v. 140, Sept. 1957, p. 400-410.

Ingot molds undergo very severe stresses which depend on gradients of temperature and on Young's modulus and on Poisson's ratio of the steel. Influence of C, Si, Mn, Cr, Ni, Mo, W, V, Co and Ti. Thermal conductivity is decreased by the addition of any element except Co. Resistance to intergranular corrosion and mechanical properties of seven steels. Importance of heat treatment. Special surface treatments with nitrogen and sulphur give better resistance to temperature gradients. (W19c, 17-57, 2-60, Q general, R general; AY)

95-W.* (French.) **Heat Treating Small Parts: the Shock Furnace.** *Metallurgie et la Construction Mécanique,* v. 89, Nov. 1957, p. 959-963.

Principle and operation of shock furnaces. (W27j)

96-W. (German.) **Induction Melting Furnaces.** Walter Annen. *Berg-und-Hüttenmännische Monatshefte,* v. 102, July-Aug. 1957, p. 189-197.

Principles and properties of induction heating with special regard to crucible furnaces using low and medium frequences. (W18a, W18c, 1-52)

97-W. (German.) **Production of Iron and Steel.** Georg Bulle. *VDI Zeitschrift,* v. 99, Oct. 21, 1957, p. 1541-1546.

Practical advice on the construction of new mills. 51 ref. (W17, W18, W23, 1-52; ST)

98-W. (German.) **Residual Stresses in Hot Rolling Rolls After Heavy Service.** Hans Bühler. *Stahl und Eisen,* v. 77, Nov. 28, 1957, p. 1740-1747. 14 ref. (W23k, F23, Q25)

99-W. (Italian.) **Standards for Rational Dimensioning of Compressed Air Equipment in Foundries.** Pier Giacomo Lanino. *Fonderia,* v. 6, Nov. 1957, p. 481-484.

102-W. (French.) **Copper Wire Rod Mill at the Le Havre Plant of Societe des Trefileries et Laminoirs du Havre.** *Cuivre, Laitons, Alliages,* no. 40, Nov-Dec. 1957, p. 13-18.

Renovated, largely automatic Garrett mill turns out 200 tons high-quality rod in 8-hr. shift with 43 workers. (W23d, 1-52; Cu)

103-W.* (French.) **A Half Million Motors Representing 1,500,000 Hp. Have Been Manufactured by Novacem.** Maurice Victor. *Revue de l'Aluminium,* v. 34, Dec. 1957, p. 1201-1205.

Novacem Co. makes extensive use of Al and die-cast Alpax in Lyons plant for essential parts of asynchronous motors from ½ to 8 hp. (W11-5, 17-57; Al, 5-61)

104-W. (German.) **Machining of Aluminum Rolling Ingots With a New High Performance Milling Machine.** A. Roth. *Aluminium,* v. 33, Dec. 1957, p. 789-793.

Design and operation of the new machine for handling larger ingots. 10 ref. (W25r, W23g; Al, 5-59)

105-W. (German.) **Modern Wire Rolling Mills.** O. Wilmes. *Draht,* v. 8, Oct. 1957, p. 425-428.

Wire rolling mills with vertical rolls and independently operated stands; power input and distribution in a mill. (W24k, 1-2)

106-W. (German.) **Continuous Pusher-Type Heating Furnace With Full-Automatic Control in a Mill Rolling Special Steel Ingots.** Josef Heimerl. *Stahl und Eisen,* v. 77, Dec. 26, 1957, p. 1873-1877.

3 ref. (W20h, 1-61; ST, 5-59)

107-W. (Polish.) **Driving and Control of Reversed Rolling Mills for Cold Rolling of Strips.** W. Grzvbowski. *Hutnik,* v. 24, Sept. 1957, p. 363-369.

Design of driving and controlling device of the rolling mill insuring even thickness of the strip. 7 ref. (W23n, 17-51, W23f, 4-53)

108-W. (Russian.) **Equalizing Valves of Blast Furnaces.** D. A. Storozhik. *Stal',* v. 17, Oct. 1957, p. 874-883.

Design of an equalizing valve of the coupled type with a built-in electrodrive. (W17g, 17-51)

109-W. (Russian.) **Design Deficiencies of DSV-Type Arc Furnaces.** M. G. Dmitrienko and A. I. Sapko. *Stal',* v. 17, Oct. 1957, p. 902-904.

(W18s, 17-51)

110-W. (Russian.) **Wear of Rolls in Continuous Sheet Mills.** E. M. Palamarchuk. *Stal',* v. 17, Oct. 1957, p. 929-933.

Roll wear in continuous mills for hot rolling sheet. Both working and supporting rolls have to be inspected equally carefully to insure high-quality production. 4 ref. (W23k, Q9, 4-53)

111-W. Cupola With Continuous-Slit Tuyeres. A. A. Anan'in and B. P. Chernobrovkin. *Foundry Trade Journal,* v. 104, Jan. 30, 1958, p. 129. (Abridged translation from *Liteinoe Provizvodstvo.)*

Intensity of combustion occurring in a cupola is governed by the amount and quality of the fuel and on the quantity, temperature and composition of the blast. A new tuyere system has been developed in which the blast is introduced through peripheral slits. Construction employed and the results obtained. (W18d, E10a)

112-W. Baking Ovens for Paint Finishing Systems. Allen S. Dawe and John A. Kinn. *Industrial Heating,* v. 25, Jan. 1958, p. 127-139. (W4k, L26)

113-W. Powder Metal Press Gets Uniform Density in Odd Shapes. *Iron Age,* v. 180, Dec. 26, 1957, p. 56-57. (W26d, 1-52, J14)

114-W. Advanced Methods for Production of Direct-Current Motors and Generators. G. W. Ambro. *Machinery,* v. 91, Nov. 29, 1957, p. 1269-1275.

Equipment and methods in semi-automated machining, drilling, welding, milling, hardening and grinding. (W11q, G general)

115-W. Titanium-Tipped Anodizing Racks. *Metal Finishing,* v. 56, Feb. 1958, p. 65.

Tips determine life of the rack. Where once racks could only be used for a week to 10 days, the Ti tips have stretched the rack cycle to over three months. Some racks have lasted eight months without repairs. Comparative costs. (W3g, 17-57, L19; Ti)

116-W. New Mill Will Roll Tough Steels. *Steel,* v. 141, Dec. 2, 1957, p. 99-100.

A 32-in. cogging mill with grooved rolls used for rolling superalloys and high-speed steel ingots. (W23a; SS, SGA-h, TS-m)

117-W. Vacuum Crane Speeds Mill Output. *Steel,* v. 141, Dec. 2, 1957, p. 102, 105.

(W12q, 1-73; SS)

118-W. Loader Speeds Plating Line. *Steel,* v. 141, Dec. 2, 1957, p. 108.

Automatic handling of plating racks. (W12r, L17, 18-74)

119-W. How to Get More From a Spheroidizing Furnace. W. B. Leyda and Walter J. Assel. *Steel,* v. 141, Dec. 9, 1957, p. 208-210.

Controlled atmosphere, five-temperature-zone roller-hearth furnace anneals seamless alloy steel tubing. (W27n, J23r, 4-60; AY)

120-W. Spotwelder Speeds Assembly. *Steel,* v. 141, Dec. 16, 1957, p. 108.

Portable torch spot welder. (W29d, K3n)

121-W. Ductile Iron Moves In. *Steel,* v. 141, Dec. 16, 1957, p. 110-114.

Use of ductile iron in sintering plants, coke ovens, quenching cars, blast furnaces, openhearths and rolling mill. (W15, W16a, W18, W23, 17-57; CI-s)

122-W. Compacts Have Even Density. *Steel,* v. 141, Dec. 16, 1957, p. 116-119.

A 300-ton hydraulic compacting press achieves uniform density throughout powder metal part by proportional pressing. (W26d, H14g)

123-W. Continuous Annealing on a Grand Scale. C. E. Peck. *Steel,* v. 142, Jan. 20, 1958, p. 74-76.

Four-sectioned furnace anneals 60 tons of tin plate per hr.
(W27, J23n, 1-61; ST, *Sn,* 4-53)

124-W. Transfer Pressing. Gordon M. Sommer and Robert H. Barlow. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 386-391.

Transfer presses, their design, operations and benefits. (W24g)

125-W. (French.) **The Unit Die System.** Gustave Nyselius. *Fonderie,* no. 142, Nov. 1957, p. 516-517.

Advantages of system; preparation of unit dies, method of use.
(W19n, 1-52)

126-W. (Russian.) **Induction Crucible Furnaces of Industrial Frequency for Light Alloy Melting.** V. A. Yakovlev. *Liteinoe Proizvodstvo,* June 1957, p. 8-15.

Design of crucible suitable for melting Mg alloys. Details of melting process in high-frequency induction crucible. Computation of power required. Results of experimental melting. 6 ref. (W18a, E10p; Mg)

127-W. (Russian.) **Design of a Contemporary Forging and Stamping Factory.** A. D. Bogdan. *Vestnik Mashinostroeniya,* v. 37, Oct. 1957, p. 39-49.

(W10, F22, G3, 18-67)

128-W. Operations at Mount ISA Copper Smelter by the Smelter Staff. *Australasian Institute of Mining and Metallurgy, Proceedings,* no. 183, Sept. 1957, p. 17-42.

(W18r, C21, 1-52; Cu)

129-W. Performance Analyses of Screens, Hydrocyclones, Jigs and Tables Used in Recovering Heavy Accessory Minerals From an Intensely Decomposed Granite on the Jos Plateau Nigeria. F. A. Williams. *Institution of Mining and Metallurgy, Bulletin, Transactions,* v. 67, Pt. 3, 1957-58, p. 89-108.

(W15p, B14m, 1-52)

130-W. Time-Saving Methods in Modern Smelteries. C. C. Downie. *Mining Journal,* v. 249, Dec. 27, 1957, p. 772-773.

Study of chain-belt system used in refining of metals in U. S. A. 9 ref. (W12r, C21, 1-52)

131-W. Plastics in the Toolroom. *Steel,* v. 142, Feb. 3, 1958, p. 108-111.

Various properties offered by varying compositions of epoxy resins in dies and die caps.
(W22a, W24n, 17-57; NM-d)

132-W. (German.) **Simple Means of Transportation in the Foundry.** Werner Riege. *Giesserei,* v. 45, Jan. 1958, p. 23-25.

Equipment for conveying and supporting. (W12r, W19b, 1-52, 18-67)

133-W. (Russian.) **Cooler Plates in Shaft of Blast Furnaces.** S. M. Andoney, G. A. Kudinov and S. M. Liderman. *Metallurg,* Dec. 1957, p. 8-9.

(W17g, W10f, 1-52)

134-W. (Russian.) **Screening the Heat Resistant Tuyere Nozzles of Blast Furnaces.** L. Ya. Shparber. *Metallurg,* Dec. 1957, p. 13.

Guarding the tuyere nozzles at temperatures of 800° and more prevents their deformation, conserves heat and saves on coke. (W17g, D1b)

135-W. (Russian.) **Preparing the Teeming Ladle for Steel From Furnace.** G. M. Guzenfeld and L. G. Korolev. *Metallurg,* Dec. 1957, p. 24-25.

New method of preparing teeming ladle with oxygen and elimination of preliminary cooling.
(W19b, 1-52; ST)

136-W. (Russian.) **Speedy General Overhauling of Large Capacity Electric Furnaces.** M. G. Dmitrienko. *Metallurg,* Dec. 1957, p. 33-34.

Erection of temporary scaffold bridges which permits simultaneous working of all crews thus substantially reducing time for overhaul. (W17j, 18-72)

137-W. (Russian.) **Performance of Ural Sheet Mills.** N. I. Gubashev. *Metallurg,* no. 12, Dec. 1957, p. 33-34.

(W23c, 1-52; ST)

138-W. (Russian.) **Induction Furnaces of Industrial Frequencies.** V. S. Astaulov. *Liteinoe Proizvodstvo,* Dec. 1957, p. 5-8.

Compares induction furnace of crucible type with that of tubular furnace with iron core. Advantages of former in economy of fuel and quality of production.
(W18a, 1-52)

139-W. (Russian.) **Modernization of Duplicate Milling Machines.** M. B. Tumarkin. *Stanki i Instrument,* v. 28, Nov. 1957, p. 14-16.

(W25r, 1-52)

140-W. (Russian.) **New Radial Drill Machinery at the Odessa Plant.** B. M. Bromberg. *Stanki i Instrument,* v. 28, Nov. 1957, p. 37-39.
(W25p, 1-52)

141-W. Rolling Mills for Fuel Elements. A. I. Nussbaum. *Atomics and Nuclear Energy,* v. 9, Jan. 1958, p. 16-19.
Rolling and fabrication of the many new elements required for atomic age. Requirements of special equipment, avoidance of radioactive hazards and knowledge of special properties of materials.
(W23c, 1-52, T11; *Pu*)

142-W. 10 Advantages of Rapid Heating of Steel. Quentin M. Bloom. *Industrial Gas,* v. 36, Jan. 1958, p. 4-5.
(W27g, J-general; ST)

143-W. Blooming Mill Controls. M. P. Rathbone. *Iron and Coal Trades Review,* v. 176, Jan. 3, 1958, p. 19-25.
Developments in automation and punch-card techniques applied to operation of heavy rolling mills. Russian advances compared.
(W23a, S-18, 1-52, 18-74; ST)

144-W. Ultrasonic Drilling. *Mass Production,* v. 34, Jan. 1958, p. 73-75.
A new machine tool that will tap a thread ½ in. deep in tungsten carbide in 15 min. (W25p, 1-74)

145-W. New Double-Duo Bar Mill. *Metallurgia,* v. 57, Feb. 1958, p. 94-96.
(W23d; ST)

146-W. Progress at Ford's New Foundry. *Process Control and Automation,* v. 5, Jan. 1958, p. 14-18.
(W19, E-general, 18-67)

147-W. Reverberatory Aluminium Holding Furnace. *Refractories Journal,* v. 33, Dec. 1957, p. 547-549.
(W19a, 1-52; Al)

148-W. (Hungarian.) **Modern Molding Machines.** Lajos Kalman. *Kohaszati Lapok,* v. 12, Apr-May 1957, p. 81-87.
(W19h)

149-W. (Hungarian.) **Modern Roll Designing. Grooving of Rolls for Structural Shapes.** Jenö Mercader. *Kohaszati Lapok,* v. 12, Apr-May 1957, p. 150-156.
(W23k, 17-51)

150-W. (Hungarian.) **Shop Experiments on Graphite Crucible Life.** Karoly Maréchal. *Kohaszati Lapok,* v. 12, July 1957, p. 158-163.
(W18c; NM-K36)

151-W. (Hungarian.) **Production of Dynamo and Transformer Sheets.** Ernö Neuhöffer. *Kohaszati Lapok,* v. 12, July 1957, p. 289-291.
(W11q, W11r, 17-57; ST, SGA-n, 4-53)

152-W. Descaling Line Cuts Stock Costs. *Iron Age,* v. 181, Jan. 23, 1958, p. 86-87.
(W2r, L10c, 1-61; ST)

153-W.* **Magnetic Separators.** A. L. Wilson, Jr. *Iron and Steel,* v. 31, Feb. 1958, p. 71-72.
Magnetic separators used to decontaminate cold rolling mill coolant reduce cleaning time, eliminate much streaking on rolled steel, and possibly increase the life of oil seals and bearings. (W23p, 1-52; NM-h)

154-W. (German.) **New Openhearth Steel Plant No. 3 of the Hoesch-Westfalenhütte AG, Dortmund.** Hans von der Warth, Georg Henke, Ernst Wiegand and Wilhelm Nellen. *Stahl und Eisen,* v. 78, Jan. 23, 1958, p. 79-87.
(W18r, D2, A5b, 10-55)

155-W. (German.) **Full-Continuous Medium Strip Rolling Mill at the Th. Wuppermann GmbH Plant, Lever-Kusen.** Heinrich Lampmann. *Stahl und Eisen,* v. 78, Feb. 6, 1958, p. 160-167.
(W23c, F23, 1-61)

156-W. (Hungarian.) **Significance of Basic Lined Hot Blast Cupola for Openhearth Establishments.** Ferenc Varga. *Kohaszati Lapok,* v. 12, Jan-Feb. 1957, p. 24-30.
7 ref. (W18c, W18r, 1-52; RM-h)

157-W. Automatic Gauge Control in Cold Strip Rolling Mill. *Instrument Practice Automation and Electronics,* v. 12, Jan. 1958, p. 57-61.
(W23c, X20c; Cu-n)

158-W. Push-Button Steel. *I. S. A. Journal,* v. 5, Feb. 1958, p. 66-67.
A card programmed control system makes rolling equipment completely automatic. Thickness is measured by X-ray.
(W23c, S18, X20c, ST)

159-W. New Bar Mill. *Iron and Steel,* v. 31, Feb. 1958, p. 53-55.
The mill, a five-stand double duo type fitted with roller bearings, will replace two existing mills and be used for rolling high speed tool and alloy steel bars to close dimensional tolerances. (W23d, 1-52; TS, AY)

160-W. (German.) **Induction Furnace for Melting of Heavy and Light Metals.** J. Tostmann. *Zeitschrift für Metallkunde,* v. 48, Dec. 1957, p. 641-646.

Construction of line frequency induction furnaces. Melting of Cu and Zn cathodes in large furnaces. The submerged resistor-type improved by straight melting channels is preferred for melting of light metals. New refractory lining materials. (W18a, 1-52; Cu, Zn)

161-W. (German.) Line Frequency Induction Crucible Furnace for Melting of Nonferrous Alloys. H. Rohm. *Zeitschrift für Metallkunde,* v. 48, Dec. 1957, p. 650-654.
(W18a, 1-52; SGA-a38)

162-W. Development of Blast Furnace Tuyeres at Wheeling Steel. E. P. Quick. *Blast Furnace and Steel Plant,* v. 46, Mar. 1958, p. 307-309.
(W17g, 1-52)

163-W.* Why Metallurgy of Iron Shot Is Important. A. M. Hall. *Iron Age,* v. 181, Jan. 16, 1958, p. 84-86.

Properties sought in malleable iron shot, made from white iron, are abrasion resistance, toughness and high yield strength. These depend on the chemistry, macrostructure and microstructure of the material, all of which can be controlled. Desired characteristics are soundness, roundness, uniform distribution of graphite in compact formation, and limitation of massive iron carbide content.
(W2a, 17-57, Q-general, CI-s)

164-W. Metal Fibers Extend Life and Uses of Plastic Tooling. *Iron Age,* v. 181, Jan. 30, 1958, p. 100-101.
(W24n, 17-57, H17; NM-d)

165-W.* Recent Developments in Slabbing Mills. H. J. Kalberkamp. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 73-81.

Comparison of characteristics of the universal slabbing mill and the high-lift, two-high mill. The latter is simpler, more economical, easier to maintain and more flexible, but does not have the capacity of the former. (W23a, 1-52)

166-W.* Techniques in Rebuilding a Blast Furnace. C. F. Bessent. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 82-94.

Methods used in dismantling and rebuilding a furnace at Sparrows Point, Md., including removal of scrap and worn parts and installation of new linings and replacements. (W17g, 18-70; Fe)

167-W.* A New Quenchant for Steel. P. E. Cary, E. O. Magnus and W. E. Herring. *Metal Progress,* v. 73, Mar. 1958, p. 79-81.

A solution of polyvinyl alcohol in water gives cooling rates between those of water and oil; medium-carbon steel parts can be readily hardened with little danger of cracking. (W28p, NM-b)

168-W.* Salt Baths and Salt Bath Furnaces. Pt. 1. Haig Solakian. *Metal Treating,* v. 9, Jan-Feb. 1958, p. 4-6, 49.

Commonly used salt mixtures, heat treating applications and suitable furnace equipment for salt baths in the 300-1150° F. and the 1200-1800° F. ranges. (To be concluded.)
(W27m, W28p, 1-52)

169-W. Special Techniques in Vacuum Metallurgy. Pt. 2. Michael Rivera. *Metal Treating,* v. 9, Jan-Feb. 1958, p. 8-11.

Vacuum furnaces of the resistance, high-frequency induction and arc types. Furnace facilities for sintering and brazing; temperature control equipment.
(W18, W17, W27, 1-73, X9s)

170-W. Manufacturing Oil-Fired Air Heating Equipment. *Welding and Metal Fabrication,* v. 26, Jan. 1958, p. 2-8.

Cutting, forming and argon-arc welding, assembly procedures used to produce air heaters from stainless steel, heat resistant and mild steel. (W10e, G22, K1d; SS, ST)

171-W. A Vacuum Arc Study Chamber. E. W. Johnson and F. R. Itoh. Paper from "1956 National Symposium on Vacuum Technology", p. 170-174.

Apparatus developed to permit observation and photography of consumable electrode melting arcs for continuous periods up to 20 min.
(W18s, 1-74, X5j)

172-W. Problems Involved in Vacuum Arc Melting Furnaces and Development of These Furnaces at W. C. Heraeus GmbH. Germany. H. Gruber. Paper from "1956 Symposium on Vacuum Technology", p. 182-189.
(W18s, 1-73)

173-W. (German.) Reel and Coil Transportation Equipment in Wire Plants and Sheet Steel Rolling Mills. A. Hinders. *Draht,* v. 9, Jan. 1958, p. 1-8.
(W12r, W24k, W23c; ST)

174-W.* (German.) Planning of Hot Blast Cupola Furnaces for Gray Cast Iron Foundries. Ernst R. Becker.

Giesserei-Praxis, no. 2, Jan. 25, 1958, p. 21-28.

Main advantages of hot blast; most economical systems; conventional and liningless furnaces.
(W18d, 1-52; CI-n)

175-W.* (German.) **Cardinal Points of Planning of Hot Blast Cupola Furnaces.** Ernst R. Becker. *Giesserei-Praxis,* no 3, Feb. 10, 1958, p. 37-42.

Construction of recuperator with dust removal by means of "ball rain". Contrivance for temperature regulation and measuring of temperature, gas pressure and gas quantity. Appliance for dust removal in foundry; utilizing of exhaust gas; economic importance of hot blast cupola aggregates in steel foundries.
(W18d, W13c, X9, 1-53; ST)

176-W. (German.) **Modern Tempering Furnaces.** A. Hohmann. *Giesserei-Praxis,* no. 4, Feb. 25, 1958, p. 70-72.

Outline of tempering mechanism; importance of analysis of new ores; development and construction of modern furnaces (tunnel furnaces); advantages of electrical (resistance) heating. (W27j, J29, 1-52)

177-W. (German.) **Heat Resistant Materials for Gas Turbines.** R. Krause. *Metall,* v. 11, Dec. 1957, p. 1066-1069.
17 ref. (W11m, 17-57; SGA-h)

178-W. (Italian.) **Specific Minimum Cost of a Smelting Furnace for Aluminum.** Roberto Allara. *Fonderia,* v. 6, Dec. 1957, p. 513-516.

Equations covering cost of electric power, electrodes, salts and furnace lining in terms of quintals of alloy melted, based on experimental data recorded during series of melts.
(W17j, C21c, 17-53; Al)

179-W. (Portuguese.) **Mace Furnaces for Sintering Ores and Concentrates.** Tharcisio de Souza Santos. *ABM, Boletim da Associacao Brasileira de Metais,* v. 13, Oct. 1957, p. 329-347.
4 ref. (W15a)

180-W. Case for Radiant Heating in Paint Finishing Processes. F. Hunt. *Industrial Finishing (London),* v. 10, Jan. 1958, p. 33-37.

Limitations and advantages of electric radiant heating. (W4k, L26)

181-W. Modern Development of the Ward Leonard Principle and Application in Steelworks. G. Ovens and C. A. Dodd. *Iron and Steel Institute, Journal, v.* 188, Mar. 1958, p. 266-276.

Development of variable-voltage drive with shunt motor and its application according to Ward Leonard principle; comparison between motor-generator sets and mercury-arc rectifier; closed-loop regulating system, magnetic amplifier and tension control. (W23n, 1-52; ST)

182-W. Improving Electric Furnace Refractory Life by Special Shell Cooling Techniques. V. J. Howard. *Modern Castings,* v. 33, Feb. 1958, p. 68-70.
(W17j; RM-h)

183-W. New Type of Brazing Furnace. *Welding and Metal Fabrication,* v. 25, Dec. 1957, p. 469-471.

Furnace with 20-cu. ft. capacity employs special ceramic refractory which eliminates necessity of special metal container in the controlled-atmosphere brazing or heat treatment of mild or stainless steel at temperatures up to 1500° C.
(W29m, 1-52; CN, SS)

184-W. New Automatic Grinding Machine for Fabrication Shops. *Welding and Metal Fabrication,* v. 25, Dec. 1957, p. 472-473.

Machine removes excess weld metal from vessels from 3½ to 18 ft. in diameter. (W25s, G18)

185-W.* Corrosion and Materials of Construction in the Plating Room. T. J. V. Cudbird. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 91-94.

Simple chemical corrosion, galvanic corrosion and concentration cell corrosion are three main methods of corrosion in plating room; methods to minimize them. Applications of steel, Al, Pb, Si-Fe alloy, rubber, vinyls and plastics for tanks, tank linings, exhaust ducts, and other uses in the plating room.
(W3, 17-57, R6g)

186-W. (German.) **New Ceramic Oxide-Carbide Cutting Wheel.** C. Agte. *Fertigungstechnik,* v. 7, Oct. 1957, p. 466-448.

First experiments showed best results with a grinding wheel made of 60% Al_2O_3 and 40% Mo_2C. Properties of Al_2O_3 versus carbides tabulated; advantages; preparation and evaluation of the oxide-carbide combination. (W25c, 17-57; SGA-j, 6-70)

187-W. (German.) **Using Synthetic Resins in Patternmaking.** Heinrich Kmoch. *Giesserei,* v. 45, Jan. 30, 1958, p. 72-74.

Methods, costs, comparison with wood or metal patterns.
(W19j, E17, 17-57; NM-d)

188-W. (German.) **Construction and Operation of Modern Hot Blast Cupola Plants.** Siegfried Tunder and Adam Esser. *Giesserei,* v. 45, Feb. 13, 1958, p. 92-96.
3 ref. (W18d, E10a, 1-52)

189-W. (German.) **Method of Operation and Lining of the Graphite Electrode Melting Furnace.** Karl Wagner. *Giesserei,* v. 45, Feb. 13, 1958, p. 100-103.

9 ref. (W18s, E10r, 1-52, RM-h)

190-W. (German.) **Oil-Firing of Melting Furnaces for Copper Alloys, With Consideration Given to Sulphur Effect.** Paul Buttkereit. *Giesserei,* v. 45, Mar. 13, 1958, p. 139-141.

4 ref. (W18, R7d; Cu, *S,* RM-k30)

191-W. (German.) **Comparison of LF Induction Furnaces for Billet Heating With Gas or Resistance Heated Furnaces for Heating of Nonferrous or Iron Blooms for Hydraulic Extrusion Presses.** J. Putz. *Metall,* v. 12, Feb. 1958, p. 113-122.

4 ref. (W27, F21; 4-52)

192-W. (German.) **Hydro-Cyclone, an Important Element of the Water Supply System of an Integrated Steelworks.** Alfred Köhler. *Stahl und Eisen,* v. 78, Feb. 20, 1958, p. 235-239.

(W10h, ST)

193-W.* (Japanese.) **Melting Procedures for, and Properties of High-Purity Metals and Alloys. Pt. 1.** Hidetake Kusamichi. *Light Metals (Tokyo),* v. 8, Jan. 1958, p. 19-32.

An electric arc furnace with consumable electrodes made of the same material as the molten metal is suitable, not only for Ti and Zr, but for special steels as well as for heat resistant alloys. 10 ref.

(W18s, C5, D9, 1-52; Ti, Zr, SGA-h)

194-W. (French.) **Air-Coolers With Copper Heat Exchangers for Cooling Electric Power Transformers.** Edouard Laennec. *Cuivre Laitons Alliages,* no. 41, Jan-Feb. 1958, p. 35-39.

(W13b, W11f, 17-57; Cu)

195-W.* (German.) **Applications, Production and Heat Treatment of Alloyed Cast Steel Rolls. Pt. 2. Materials, Use and Casting of Steel Rolls and Various Methods of Heat Treatment.** Heinz Uhlitzsch and Gerhard Radomski. *Neue Hütte,* v. 3, Jan. 1958, p. 10-20.

Advantages of cast steel rolls; composition of suitable materials in relation to various purposes; appropriate methods of heat treatment; conditions and casting technique; causes of cracking and crack prevention. (W23k, 17-57, E11; ST)

196-W. (Polish.) **Automatic Loop Drive in Hot Rolling Mills.** Ryszara Hagel and Joachim Jonca. *Hutnik,* v. 24, Dec. 1957, p. 488-494.

7 ref. (W23n, 1-52)

197-W.* **International Views on Foundry Ventilation.** Antonio Riggi. *Foundry Trade Journal,* v. 104, Feb. 27, 1958, p. 237-243.

Smoke and dust-exhausting equipment installed in a cast iron and aluminum alloy foundry. 10 ref. (W13c, E-general; CI, Al)

198-W. Foundry Goggles. Pt. 2. *Foundry Trade Journal,* v. 104, Mar. 6, 1958, p. 259-269.

Preliminary report of British committee. Plastic lenses afford more protection against both solid and molten metal than do either toughened or laminated glass lenses. (W13k, E-general)

199-W. Combination Gas and Electric Heating in Rotary Hearth Furnace for Treating High Speed Steel Bearing Rings. *Industrial Heating,* v. 25, Mar. 1958, p. 496-499.

(W27, 1-52, T7d; TS-m)

200-W. New Methods in Maintenance of Refractories in Steel Plants: Pt. 4. *Industrial Heating,* v. 25, Mar. 1958, p. 579-584.

Evaluation of cast refractory and brick linings; refractory and installation costs; increase in hot top value during lining life and practicability of using reduced hot tops. Castable replacement costs are 40% less than those using refractory shapes, due to elimination of skilled labor required to brick the tops and through greater utilization of existing nonskilled labor. (W19c; ST, RM-h)

201-W. Arc Image Furnace Produces Temperatures Above 7000° F. *Industrial Heating,* v. 25, Apr. 1958, p. 728-730, 734.

(W18s)

202-W. Instrumentation in Vacuum Induction Melting. *Industrial Heating,* v. 25, Apr. 1958, p. 732-734.

Instrumentation for a 1-ton induction vacuum furnace comprises a small top-charging chamber separated from the main melting chamber by a large horizontal gate valve. (W18a, X-general, 1-73)

203-W. A New Single-Operation Precision Blanking Press. *Machinery (London),* v. 92, Mar. 28, 1958, p. 724-726.

Hydraulic press was developed to produce blanks from sheet or strip metal with an edge finish equivalent to that obtained by shaving or grinding. Precision blanking applied to metals with thicknesses varying from 0.06 to 0.315 in., with output of 600 to 800 pieces per hr. Four sizes have been developed; the latest types have provisions for mounting strip-feeding equipment. (W24g, 1-70, G2h)

204-W. Equipment for Fusion Welding Large Pipes. *Machinery (London),* v. 92, Apr. 4, 1958, p. 785.

(W29, K-general, 1-52; ST, 4-60)

205-W.* Automation of a Barrel Plating Line. *Metal Finishing Journal,* v. 4, Mar. 1958, p. 75-79.

Automatic, independent - cycling machine for Cd barrel plating. (W3b, L17; *Cd,* 18-74)

206-W. Conveyorized Die-Casting Foundry. *Metal Industry,* v. 92, Feb. 14, 1958, p. 127-129.

(W12r; E13; 18-67)

207-W. Electric Furnace Developments. P. F. Hancock. *Metal Industry,* v. 92, Feb. 28, 1958, p. 167-169.

Progress in arc, induction and resistor furnaces. (W17j; W18a; W18s)

208-W. Large Aluminum Plate. *Metal Industry,* v. 21, Mar. 1958, p. 231-234.

Five new pieces of equipment installed in a plant for production and testing large Al plate. (W23b; Al, 4-53)

209-W. Fourslide Press or Progressive Die? J. H. v. d. Burgt. *Sheet Metal Industries,* v. 35, Mar. 1958, p. 165-178.

(W22p, W22a)

210-W. Nozzle Changes Pay Off. *Steel,* v. 142, Apr. 21, 1958, p. 144, 146.

Nozzle material, shape, refractoriness, quality, size and effect of these variables on ingots and the steels rolled from them. (W19e, D9; NM-h, ST, 5-59)

211-W. An Assessment of Various Furnace Linings. Edgar Spetzler. *Stahl und Eisen,* v. 76, Dec. 27, 1956, p. 1734-1740. (Iron and Steel Institute, Translation no. 554.)

Previously abstracted from original. See item 67-W, 1957. (W18, D2g; RM-h)

212-W.* (German.) Modern Melting Practice in the Production of Metals and Alloys of Extremely High Purity. W. Scheibe. *Metall,* v. 11, Oct. 1957, p. 854-859.

In a high-vacuum d-c arc furnace for laboratory use, a water-cooled copper mold is used instead of a crucible. The material to be melted is charged through a self-consuming electrode, which is fed automatically, maintaining a constant arc. A stirring motion can be created through an electric coil around the outside of the mold. The output of the furnace can be regulated between 3 and 4 kg. per min. 3 ref. (W18s, X24f, 1-73)

213-W. (German.) Choice of Steels for Molds and Hot Working Dies for Centrifugal Casting. J. Klarding. *Metall,* v. 12, Jan. 1958, p. 12-20.

With carbon steels the hardening process can be repeated more times before cracking than with alloy steels; the aluminum content has a bearing on the number of repeated hardenings until brittle. 4 ref. (W19g, W19n, 17-57, E14; ST)

(W23, T7d, 17-57; Cu-s)

318-W. Design of Press Structures. Pt. 2. Tie Rod Shrinking. *Modern Industrial Press,* v. 20, May 1958, p. 31-34.
Theory of tie rod shrinking and relationship between stresses in tie rods and parts of the press frame. Details for shrinking and methods for heating tie rods. (W24g; 17-51)

319-W. (Italian.) **Proper Cupola Design.** Ottavio Barbavara di Gravellona. *Rivista di Meccanica,* v. 9, Mar. 15, 1958, p. 29-32.
(W18d, 17-51)

320-W.* (Japanese.) **A Permanent Wall-Type Furnace With Forced Cooling, Water-Cooled Basic Cupola.** Ryozo Sato. *Japan Foundrymen's Society, Journal,* v. 30, Mar. 1958, p. 152-158.
Basic practice can be operated by the application of water cooling method to melting zone of the cupola which has been lined with thin basic material. (W18d)

321-W. Plastic Tooling Opens New Markets. *Metal Forming and Fabricating,* v. 20, June 1958, p. 17-19.
Phenolics, polyesters and epoxies are being more widely used as dies. Advantages include low shrinkage, good machinability, high chemical resistance, excellent adhesion, low cost. (W24n, NM-d30)

322-W. The All-Basic Openhearth. *Metal Progress,* v. 73, June 1958, p. 85-87.
With hearth and walls already being constructed of basic material, the only area left to complete the all-basic openhearth is the roof.

Work conducted by American and British steelmakers over the last few years indicates that higher production and longer roof life can be expected when problems imposed by the use of basic brick are solved. (W18r, D2, 1-65; RM-h, ST-e)

323-W. Processing With Continuous Heating. An Economic Appraisal. Frederic O. Hess. *Metal Progress,* v. 73, June 1958, p. 99-105.

The continuous furnace should be thought of as a processing tool. Many factors in its design and operation require a realistic appraisal. For example, rating a furnace on fuel efficiency and fuel costs can be deceptive. Most continuous furnaces today are not single-purpose devices and this must be considered in their evaluation. (W20h, W27, 1-61)

324-W. A New Approach to Open Hearth Maintenance. E. W. Hunziker and M. E. Strate. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 110-120.

Prefabricating an entire openhearth furnace and moving it into position results in less downtime, saving labor and money. (W18r, 18-71)

325-W. Prefabricating New Fronts for Open Hearth Furnaces Saves Time and Money. A. W. Schoenbeck. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 129-138. (W18r)

326-W. Patching an Open Hearth Roof. C. L. Meloy. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 138-146. (W18r; RM-h)

327-W. Progress Report on Basic Construction. A. H. Sommer. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 175-179. (W18r, 1-65; ST)

328-W. Progress Report on Flat Basic Roof Installation. J. F. Pollack. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 180-183. (W18r, 1-65; ST, RM-h)

329-W. Progress Report on All-Basic Roofs at Laclede Steel Co. L. D. Yager. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 183-184. (W18r, 1-65; ST, RM-h)

330-W. Progress Report on Flat Basic Open Hearth Roof at Inland Steel Co. P. W. Nutting. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 184-190. (W18r, 1-65; ST, RM-h)

331-W. Use of Basic Refractories for Open Hearth Roofs and Checkers. C. W. Cravens. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 191-207.

Use of electrocast brick gives results somewhat similar to those of conventional metal-encased brick in combination with silica brick. The initial trial of basic checkers was unsatisfactory because of excessive spalling. (W18r, 1-65; ST, RM-h)

332-W. Use and Economics of Basic Runners. Anthony R. Edwards. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 219-225.

Basic runners are far superior to the brick runners in point of service and they operate at a great economic saving. (W18r, D9n; RM-h)

333-W. Mechanical Aids to Openhearth Repairs. M. H. Weir. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 226-230.

Large materials handling machinery reduces downtime during repair work. (W18r, W12, 18-72)

334-W. Advantages of an All-Basic Furnace in a Cold-Metal Shop. Lewis B. Lindemuth. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 230-235.

Advantages with basic roof and basic end construction, contrast with the previous general silica construction on the 175-ton openhearth furnaces. (W18r, 1-65; ST, RM-h)

335-W. Experiments With Fuel-Fired Jet Atomizing Fuel-Oil Burners. William Wood. *National Open Hearth Steel Committee Proceedings,* v. 40, 1957, p. 241-244.

Results demonstrate possibilities for improving combustion and increasing openhearth production. (W18r; RM-k30)

336-W. (German.) Use of Hard Metals for Punch Construction. G. Viereggе. *Das Industrieblatt,* v. 58, Apr. 1958, p. 129-132.

Economic expediency and limits of application. Construction of the punches; maintenance and resharpening. Suitable hard metals. Equipment for manufacturing punches. Applications and experiences. (W24p; 17-67; 6-69)

337-W. (German.) Importance of Jigs for Punches and Dies in Forming of

Sheets. Kurt Venninger. *Das Industrieblatt,* v. 58, Apr. 1958, p. 133-135.

Influence of stamping regularity on the durability of tools. Construction of plate jig and column jig, their applications and advantages Use of low melting alloys for repairing or manufacturing jigs designed for temporary application. (W25f, G1; SGA-d)

338-W.* (Italian.) **Design and Specifications for a Special Furnace for Austenitizing Stainless Steel Sheet.** I. Montevecchi. *Metallurgia Italiana,* v. 50, Feb. 1958, p. 53-58.

Differential calculus was used to plan automated installation for treating large sheets of 18-8 and 20-25 Ni-Cr alloy. Installation includes conveyor system which handles materials by means of holes bored near edges, thus avoiding contact by any equipment with surfaces of sheet. Bored areas are removed by subsequent machining, which would be required in any case. (W27, W12r, 1-52, J22; SS, 4-53)

339-W. (Rumanian.) **Selenium, a Product New to the Rumanian Chemical Industry.** A. Blankenburg. *Revista de Chimie,* Feb. 1958, p. 96-98.

Use of Se in electrolytic refining of Cu and other metals. 4 ref. (W17e, 17-57; Se, *Cu*)

340-W. Big Billets. *Aircraft Production,* v. 20, May 1958, p. 186-191.

Installation of heavy equipment by Northern Aluminum for the production of plate for large integral airframe units. (W22, W27, T24a; 4-53)

341-W.* Barrelling. Preshaped Synthetic and Metal Chips. *Aircraft Production,* v. 20, June 1958, p. 210-214.

Synthetic preshaped chips for doing work on surfaces in restricted situations without risk of lodgement; and the use of shaped metallic media. (W2a, L10c, 1-52)

341-W. A 40-Ton Arc Melting Furnace With Modern Electrical Equipment. R. Lambert. *Brown Boveri Review,* v. 45, Feb. 1958, p. 88-94. (W18s, 1-52; ST, RM-p)

343-W. Flap-Type Coated Abrasive Wheels. Morroy Patterson. *Grinding and Finishing,* v. 4, June 1958, p. 30-38.

Polishing element is a series of coated abrasive leaves and flaps. The flaps are arranged in a circle to form a wheel. (W25c)

344-W. Four-High Skinpass Mill and Electric Equipment to Nihon Teppan Co., Ltd. Hideyuki Yamamoto, Katsumi Fumiki, Masataka Nishi, Hideo Iwaki and Isamu Shiraki. *Hitachi Review,* v. 7, Mar. 1958, p. 3-13. (W23c)

345-W. Modern Iron and Steel Plants. Layout, Handling, Power, and Costs. Paul Rheinlander. *Iron and Coal Trades Review,* v. 176, May 30, 1958, p. 1261-1267. (From *Stahl und Eisen,* Jan. 9, 1958). (W10, W11, D-general, 17-53)

346-W. Oxygen-Refining in the Open Hearth. *Iron and Coal Trades Review,* v. 176, May 30, 1958, p. 1279-1281.

Design and use of an oxygen "gun" for decarburization of mild steel heats at the Steel Co. of Wales. (W18g, D2g, 1-52)

347-W. Linings for Hot Metal Mixers. F. H. McRitchie. *Refractories Institute, Technical Bulletin,* no. 98, Nov. 1957, 12 p.

Important design and service factors affecting life of hot metal mixer and car linings. 29 ref. (W18n; ST, RM-h)

(W20h, F21b)

377-W.* **Ceramic Tooling.** Herbert Schwartz. *Modern Machine Shop,* v. 31, Aug. 1958, p. 70-75.

Uses and advantages of ceramic materials in producing tooling for high temperature. (W25b; NM-f)

378-W.* (Italian.) **Manufacture of Aluminum Heat Exchangers.** *Alluminio,* v. 27, June 1958, p. 289-306.

Descriptions and photographs of numerous American and European devices and components; types of exchangers and their applications; physical requirements; fabrication techniques. Tables of mechanical and technological characteristics of numerous Al alloys, machining norms and other data. 17 ref.
(W13b, 17-57; Al-b)

379-W.* (English.) **Establishing of a Relation Between the Life of Ingot Molds and the Quality of Cast Iron for Ingot Molds.** Traian Dumitrescu. *Revue de Métallurgie (Bucarest),* v. 1, 1956, p. 55-62.

On the basis of tests conducted on 99 ingot molds of compositions which cover the range used in practice, it is found that a well-defined, nearly parabolic, relation exists between the life of the ingot molds and the combined effect of the Si, Mn and S, represented by the ratio k of Si to free Mn. The life of the mold is a minimum for k between 7-9 and increases when the ratio drops below 7 or rises above 9. To obtain optimal life the only practically realizable solution is to increase the Mn content so that k be around unity. 4 ref.
(W19c, 17-57; CI, 17-52)

380-W. **Ingot Molds of Magnesium-Treated Spheroidal-Graphite Cast Iron.** G. A. Pisarenko. *Metallurg,* Dec. 1956, p. 16-19. (Henry Brutcher, Altadena, Calif., Translation no. 4203.)

Recommended cupola melting practice for mold iron; make-up of charge. Method and set-up for Mg treatment of cupola iron; composition of iron. Technique of casting the ingot molds; how to avoid subcutaneous cavities; how to heat

treat the molds. Typical microstructure of mold iron. Service life and production costs of new molds compared with molds of ordinary gray iron. (W19c, 17-57, E25q; CI-r, *Mg*)

381-W.* (German.) **Operation of Graphite Melting Crucibles.** Alfred Naundorf. *Giessereitechnik,* v. 4, Apr. 1958, p. 86-91.

Composition and properties of crucibles, installation in furnaces; effect of fuel on crucibles; use of fluxes; treatment of crucibles after usage. (W18h, 1-52, E10p)

429-W.* (French.) How to Build a Steel Mill. Claude Laperrousaz. *Manutention,* no. 46, Apr. 1958, p. 73-78.

Two possible plant layouts and sets of equipment for mass pro-

duction of 500-kg. ingots are analyzed in terms of efficiency, safety, investment, maintenance, space requirements and other factors. Coefficient of use of cranes becomes governing factor in selection and placement of equipment, including cranes themselves, to handle raw materials and product of 50-ton electric furnace to be tapped approximately every 200 min.
(W10a, W12q, W18s, 1-52; ST)

430-W.* (German.) **Experiences With Permanent Molds.** Hermann Wesner. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 46-67.

In the manufacture of permanent molds the preservation of the cast skin on all surfaces that will come in touch with the molten steel is important. Only core-marks are machined. The undivided half-mold with a false core is most suitable. The false core has to be fitted with the pouring basin and sprue and with efficient risers, for risers in the mold itself would not provide the sufficient pressure to avoid pipes, and pouring immediately against the mold would cause fast wear. In the experiments, the molds were blackened successfully with a mixture of soot and alcohol. All the experiments were made with electric steel. (W19g, E12; ST)

431-W.* (German.) **How to Increase the Durability of Cast Iron Permanent Molds.** Walter Feicke and Georg Arand. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 135-180.

Material used is different for each type of production; cast iron for steel mill ingot molds; alloy steel and nickel alloy cast iron for centrifugal castings; gray cast iron and carbon steel for shaped castings. Thermal resistance in relation to the tensile strength, Brinell hardness and thermal conductivity; dimensional stability at various temperatures. Suggested materials are of stable ferrite or pearlite structure with the graphite particles as short as possible. 38 ref. (W19g, 17-57, P10d, Q27a, Q29b; AY, CI, CN)

432-W.* (French.) **Contribution to the Study of Rolling Mill Equipment. Pt. 2. Rolling Mills. Sect. 6, Rod and Strip Mills.** G. Grenier. *Echo des Mines et de la Metallurgie,* no. 3516, May 1958, p. 293-295.

Roll trains in U S. for making 18-8 stainless steel rod. European strip mills from about 1900 to present. (To be continued.)

448-W. (German.) **Determination of Tolerances in the Design of Punches and Dies.** L. Segalle. *Fertigungstechnik*, v. 8, May 1958, p. 209-217.

In the design of tools, special construction features, structural properties and thickness of the sheet metal to be used in production. The size and shape of parts to be manufactured and the clearance between punch and die should be taken in consideration. (W24n, W24p, 17-51)

449-W. (German.) **A New Type Grinding Wheel.** H. Kohlhase. *Fertigungstechnik*, v. 8, July 1958, p. 315-316.

A special grinding wheel fitted with bristles and abrasive cloth machine-grinds inaccessible lacquered surfaces. (W25c)

450-W.* Calculation of Cooling Characteristics of Barstock on Cooling Beds and the Suitability of Certain Cooling Bed Designs for Material of Different Compositions and Profiles. Paul Grüner. *Draht (English Edition)*, no. 35, June 1958, p. 19-26.

Principal purposes and functions of cooling beds. Drives and designs of various cooling bed units, including inlet roller conveyor, transverse feeder, rod aligner, transfer unit, mechanical rake, Morgan, Edwards, roller-type and rotating type cooling beds. (To be concluded.)
(W23p, F27, 1-52; ST)

451-W.* (Spanish.) **Deep Penetration Electrodes.** Celso Penche. *Ciencia y Tecnica de la Soldadura*, v. 8, May-June, 1958, 14 p.

History; types, techniques of use; technological and economic advantages; structural, metallurgical behavior and mechanical properties of welds obtained on various steels; applications. (W29h, K1)

452-W.* Light Section Rolling Mills. Stanislav Makrlik. *Czechoslovak Heavy Industry*, June 1958, p. 25-31.

Three typical examples of rolling mill designs. Metallurgical plants

supplying the technical particulars and requirements, so the supplier can design a mill based on technical and economic analysis. (W23, 17-51)

453-W.* Mercury-Arc Converters for Induction Heating. T. A. Cosh. *Foundry Trade Journal,* v. 105, Sept. 4, 1958, p. 291-294.

Application of grid control to mercury-arc rectifiers as sources for high-frequency electric supplies in relation to their application to melting furnaces. (W18a, E-general)

454-W.* (German.) Test with Zirconium Silicate Linings in Arc Furnace Covers. Alfred Theis. *Stahl und Eisen,* v. 78, June 26, 1958, p. 891-892.

A lining based on zirconium-cristobalite proved successful for covers of arc furnaces subjected to severe wear. A prerequisite is adequate cooling of the cover to prevent distortion. The additional life of lining (up to 126 heats) and savings in brickwork offset in many cases the higher cost of the lining material. Small heat expansion and high resistance to fire pressure are the main characteristics in comparison to conventional silicate linings. (W18s; RM-h)

455-W.* (Polish.) Flame, Gas-Fired Furnace With Heat Recuperation for Pig Iron Melting. Gabriel Kniaginin and Roman Andrzejewski. *Hutnik,* v. 25, May 1958, p. 165-171.

Furnace of 25 tons capacity. Process of pig iron melting. Heat balance of the furnace. Suggested improvements. 8 ref. (W19a; CI-a)

456-W.* (Russian.) Hard Metal Reinforced Punching Dies. S. S.Chetverikov and N. K. Foteev. *Vestnik Mashinostroeniya,* v. 38, Aug. 1958, p. 38-40.

Experiments for determining most effective metallo-ceramic alloys for reinforcing dies utilized transformer sheet steel, 0.5 mm. thick, of composition 0.1% C, 4.2% Si, 0.1-0.2% Mn, 0.025% P and 0.035% S. Alloys of medium grain size are most effective. Reinforced punching dies of above steel are ten times more durable than those using tool steel, and operate with much greater precision. (W24n, 17-57; ST, Si, 4-53, 6-70)

457-W. Applying Carbides to Drawing Steel Casings. *Carbide Engineering,* v. 10, Sept. 1958, p. 22.

Use of carbide dies for drawing 7-in. oil well casings at Pittsburgh Steel Co.'s Allenport Works saves money over steel dies. (W24n; 6-69)

(W23p, T7, 17-57; CI-r)

494-W. (Book.) **Gas Turbine Materials.** G. Lucas and J. F. Pollock. 163 p. 1957. Temple Press Ltd., Bowling Green Lane, London, England. 25 sh.

Historical development of high-temperature alloys. Creep and fatigue properties and corrosion resistance necessary to withstand high-temperature stress and oxidative conditions in gas turbine engines. Selection of engine material and applications of specific alloy type in compressor, combustion chamber, turbine disk, rotor assembly, turbine blading and heat exchangers. High-temperature properties and composition of commercial high-temperature alloys. Manufacture of turbine components.
(W11m, 17-57, Q-general; SGA-h)

495-W.* (French.) **Contribution to the Study of Rolling Mill Equipment. Pt. 2. Rolling Trains. Sec. 7. Sheet and Plate Mills.** G. Grenier. *Mines et Metallurgie*, June 1958, p. 365-367.

Plate and sheet products classified in four groups, according to thickness; types of rolling trains used in each case; sequence of concomitant operations (chipping, reheating, straightening, shearing, heat treatment, etc.) (W23, 1-52)

496-W.* (French.) **Study of Thomas Converter Bottoms.** Paper presented at Apr. 25, 1958, meeting of Association of Engineering Graduates, University of Liege. W. Kohler, Th. Hartman and G. Tromel. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 259-260.

Techniques of vibrating in mold and effects of vibration on distribution of material; study of fired and unfired bottoms. Effect of composition of iron processed in converter, of condition of joint between bottom and lining and other factors on bottom life. Heating and cooling of bottoms during converter operation. (W18k; RM-h)

497-W.* (French.) **Vibration of Converter Bottoms by Means of a Vibrator plate in French Steel Mills.** Paper presented at Apr. 25, 1958, meeting of Association of Engineering Graduates, University of Liege. J. de Hedonville. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 260.

Vibrator plate consists of table resting on supports under which vibrators are attached. Sole-plate and form are placed on top of table without any type of fastening. A grid to hold pipes in position is placed on top of form. Principal advantage of vibrator tables is great simplicity of installation and use. They permit manufacture of bottoms of different diameters and hole arrangement. Can also be used for making bottoms with Mg pipes. Life of bottoms vibrated by this technique is at least equal to that of rammed bottoms. (W18k; RM-h)

498-W.* (French.) **New Methods of Firing Bottom Joints in Thomas Converters.** Paper presented at Apr. 25, 1958, meeting of Association of Engineering Graduates, University of Liege. Legrandjacques, De Rousiers and Delong. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 260.

Use of oil burners; burners fed by coke plant gas; burners fed by blast furnace gas; electrical heating.
(W18p; RM-m)

499-W.* (French.) **New Method of Vibrating Converter Bottoms.** E. Glaesner. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 261-269.

Technique of top vibration by means of a plate into which are fitted rods covering pipes. Plate transmits vibrations to rods only, and these in turn to surrounding mass. Transference of vibration is highly efficient and uniform and maximum settling of dolomite mixture is achieved. This technique (which replaced system of lateral vibration), plus increase in height of bottom and use of Cu instead of steel pipes, increased bottom life by about 50%. In addition, use of a powerful burner fed by blast furnace gas for firing linings made it possible to pour instead of ram joints of first bottoms; life of latter has increased to point where it exceeds that of subsequent bottoms.
(W18p; RM-h)

500-W.* (French.) **Unfired Converter Bottoms at the Societe Cockerill-Ougree's Thomas Steel Works in Seraing.** R. Schuermans and J. Van

Neste. *Revue Universelle des Mines,* v. 14, Aug. 1958, p. 270-279.

Bottoms are placed in converter without prior firing in dolomite shop, and are then fired simultaneously with joint. Increase in average life of bottoms is attributed to higher residual carbon content and lower porosity than in fired bottoms. Effect of duration of aging of unfired bottoms before placement in furnace. Preparation of bottom mold, processing of dolomite mixture, manufacture of bottoms; specifications of bottoms, sole-plates, operating conditions, dolomite consumption. (W18p; RM-h)

501-W.* (French.) **Manufacture of Dolomite Bottoms at Marchienne Works of Forges de la Providence.** M. Ledune. *Revue Universelle des Mines,* v. 14, Aug. 1958, p. 280-283.

Description of new dolomite shop, where particle size is closely controlled. Principal innovations are heating of 2-15 mm. diameter particles by infrared radiation in a rotary furnace; use of Eirich mixer equipped with 85-lb. wheel and agitators. Heating method avoids hydration, long-wave radiation permits deep heating of particles despite their high refractoriness. Best results have been obtained with bottom mixture composed of 62% particles of 2 to 15 mm. diameter and 38% filler 0-0.35 mm., with amount of tar added representing about 9% of total mass. Bottoms are poured, then vibrated laterally. Vibration permits use of drier mixtures (9% tar instead of 12%). Bottoms are not tubed. New methods have increased lining and bottom life about 50%. (W18p; RM-h)

502-W.* (Italian.) **New Venezuelan Steel Mill.** Massimo Gonni. *Metallurgia Italiana,* v. 50, June 1958, p. 215-245.

Initial capacity of integrated mill on Orinoco River, is 700,000 tons per yr., to be increased to 1,500,000 tons per yr. in future. Martin furnaces will be used. Details of installations, local supply of raw materials, production program. Blooming mill, motors and electrical equipment for rolling mills, Martin furnaces and pit furnaces. First seamless tube was rolled in April 1958. Construction scheduled for completion in June 1960.

(W10, W17, W23, 1-52; ST)

503-W.* (German.) **Plant Tests of Mill Casings.** Urmas Runolinna. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 11, Sept. 1958, p. 432-437.

Tests of ball and rod mill casings conducted at the Otanmaki plant which separates ilmenite from Finland's titaniferous magnetite. Advantages of using steel bars for casings instead of steel plates. Weight of ball mill casing was reduced by inserting 20-mm. wide wood beams between 80-mm. wide Cr-Mn steel bars. Further weight reduction and better wear results were obtained by replacing Cr-Mn steel bars with 30-mm. wide special Cr-Ni cast iron. (W15n, 17-57; CI, ST, Cr, Ni, Mn, 4-55)

504-W.* **Power Quills Speed Output at Lower Cost.** Ben C. Brosheer. *Metalworking Production,* v. 102, Oct. 10, 1958, p. 1781-1783.

For detailed precision drilling and reaming, precision milling, grinding and polishing with coated abrasive tools, with bonded grinding wheels or with either or tungsten carbide routing cutters, or with machine-ground burrs. (W25, 1-52)

505-W.* **Bar Mill of Tomorrow.** *Steel Equipment and Maintenance News,* v. 11, Sept. 1958, p. 6-7.

Automatic operations at new bar mill consist of uniformly heating 3 and 4-in. square steel billets and then passing them through a series of alternate vertical and horizontal stands. After the bars pass through 16-mill stand, they are run off onto one of two cooling beds where they are gradually cooled before being sheared into specified lengths for shipment. Bar mill furnace data given. (W23d)

516-W.* Forging Huge Crankshafts. Charles H. Wick. *Machinery,* v. 65, Oct. 1958, p. 113-116.

Giant crankshafts and other massive forgings are produced from SAE 5046 steel by 50,000-lb. steam drop hammer. Installation has three hydraulic presses for sizing, bending and trimming. (W22n, 1-52; AY)

517-W.* (German.) CTIF Recuperator for the Hot Blast Cupola. Georges Ulmer. *Giesserei,* v. 45, Sept. 11, 1958, p. 531-541.

New type recuperator forms a part of the furnace itself added to its top and shaped like a double-wall chimney. The blast air is heated between the ribbed inner wall and the outer wall. Combustion of gases inside the recuperator is adjusted by a burner on the bottom and a chimney damper on the top. In this way, and by controlling the quantity of air to be preheated, efficient operation of furnace and recuperator is provided. (W18d)

518-W.* (German.) New Vibratory Process of Ramming Converter Bottoms. Ernest Glaesener. *Stahl und Eisen,* v. 78, Aug. 21, 1958, p. 1169-1175.

Converter bottoms of increased lifetime can be produced by a new vibrating method whereby the dolomite-tar mixture is bound uniformly by vibrating rods within the blow holes. Additional heating of the preheated mixture, before final vibrating. Bottoms produced by this method proved to be more durable than those bound by other ramming or vibrating processes. (W18p; RM-h)

519-W.* (German.) Deposits in Checker Chambers of Openhearth Furnaces Caused by Smelting Large Quantities of Scrap. Otto Darmann and Gustav Mahn. *Stahl und Eisen,* v. 78, Aug. 21, 1958, p. 1176-1180.

When large quantities of galvanized iron scrap are smelted, slag deposits form in the checker chambers which affect performance and lifetime of the furnace. The slag contains up to 50% ZnO and can be reduced with CO, top gas, city gas and producer gas, which makes it possible to increase the economy of a furnace if top gas is applied regularly. (W18r, D11q; RM-p, RM-q)

520-W.* (German.) Unbaked Converter Bottoms in the Basic Steel Plant of the S. A. Cockerill-Ougree. Roger Schuermans and Jaques Van Neste. *Stahl und Eisen,* v. 78, Sept. 18, 1958, p. 1308-1313.

Plant experiments with converter bottoms from a dolomite-tar mixture. A 2% manganite (MnO_2) addition exerts a polymerizing influence on the formation of coked residues. The bottoms were vibrated, aged over several weeks, built into the converter and only then baked with a fuel oil flame. A durability from 80 to 100 melts was reached. (W18p; RM-h)

524-W. Automatic Fuel Control. *Iron and Steel*, v. 31, Oct. 1958, p. 507-508.

Design and construction of a new bloom reheating furnace for the Ormseby rolling mill at the Cargo Fleet iron-works of the South Durham Steel and Iron Co., Ltd. (W20h)

525-W. Contribution to the Study of Thin-Walled and Thick-Walled Blast Furnaces. J. Libricky. Paper from "Advances in Steel Technology in 1956", United Nations, 1958, p. 49-56.

Czech progress. (W17g, 17-51)

526-W. Areas of Application and Operating Results of the Short Rotary Furnace. W. Schwartz. *Metall*, v. 10, no. 3-4, 1956, p. 113-116. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. 58-1485.)

(W18b)

527-W. Determination of the Main Measurements of Siemens Martin Furnaces. S. Cernoch. *Neue Hutte*, no. 3, Jan. 1956, p. 150-156. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

(W18r)

528-W. Difficulties in Controlling Furnace Pressure. R. Jeschar. *Stahl und Eisen*, v. 20, Oct. 4, 1956, p. 1284-1289. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

Previously abstracted from original. See item 241-F, 1956. (W20h, S18r)

529-W. Geometry of the Lower Part of an Ingot. L. V. Andreyuk. *Stal'*, v. 17, Jan. 1957, p. 35-38. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

Previously abstracted from original. See item 473-W, 1957. (W19c, 1-52; ST)

530-W. New Cast Irons for Rolls. H. Goebel. *Stahl und Eisen*, v. 77, Feb. 7, 1957, p. 143-157. (British Cast Iron Research Assoc., Alvechurch, Birmingham, Translation no. 826.)

Previously abstracted from original. See item 127-W, 1957. (W23k; CI, 17-57)

531-W. (French.) **International Research on Thomas Converter Bottoms.** Papers presented at Apr. 25, 1958, Meeting of Association of Engineering Graduates of University of Liege. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 259-283.

Manufacture of bottoms; vibrating and firing practices; unfired bottoms; bottom life. Papers abstracted separately. (W18p; RM-h)

532-W. (Italian.) **Melting Furnaces for Zinc Alloys.** Turno di Michelis. *Fonderia*, v. 7, Aug. 1958, p. 349-355.

(W18, E10; Zn-f)

533-W.* Railroad Car Rebuilt and Repaired at Kaiser's Fontana Works. A. B. Stoker. *Iron and Steel Engineer*, v. 35, Aug. 1958, p. 132-137.

Steel plant shop designed and rebuilt railroad cars more durable and better adapted to their needs than could be purchased. Main cause of damage occurred during loading and unloading of materials by magnet and damage was increased by accumulation of nonmagnetic materials in bottom of cars. Gondola, flat, and dump car construction. (W12p, W12s, 18-72)

534-W. (Russian.) **Use of Heat Resistant Stainless Steels in Power Plants Operating Up to 600° Steam Temperature.** E. S. Ginzburg. *Metallovedenie i Obrabotka Metallov*, June 1958, p. 47-52. (Henry Brutcher, Altadena, Calif., Translation no. 4254.)

Although stainless steel with 12% Cr meets general requirements for power plant service, it is limited in use to 420-480°. Results of extensive tests indicate that alloys EI747 and EI748 are suitable for turbine blades operating between 565 and 600°. 7 ref.
(W11g, 17-57; SS, SGA-h)

535-W.* The Steam Jet Ejector: A Versatile Pump for High Vacuum. V. V. Fondrk. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 88-94.

Performance characteristics, installation, operating and maintenance costs, typical installation on consumable electrode vacuum melting furnace. Use of ejectors on stream degassing units presently operating in various steel mills and foundries in this country.
(W13d, W18s, 1-73)

536-W.* (German.) **Modern Machines in the Light Metal Industry.** *Aluminium,* v. 34, Sept. 1958, p. 545-547.

An automatic gang press, a columnless heavy press, a hydraulic deep drawing press and an impact extrusion press for nonferrous metals. (W24g, 1-52; EG-a39)

537-W. One Man Handles Flexible Heat Treating Line. F. V. Horak. *American Machinist,* v. 102, Oct. 20, 1958, p. 142-143.

(W27, W28n, 18-74)

538-W. New Roller Hearth Annealing Furnace With Electronic Control. *British Steelmaker,* v. 24, Oct. 1958, p. 330-331, 328.

Used for the heat treatment of stainless steel tubes on either a continuous or batch production basis. (W27g, J23; SS)

539-W. Cast Iron Sectional Boilers. Jan Severa. *Czechoslovak Heavy Industry,* no. 9, 1958, p. 22-24.

Efficiency of various boilers using different fuels.
(W11h, 1-52; CI, 17-57)

546-W. (French.) **Vacuum Melting Furnaces With Consumable Electrodes.** H. Gruber. *Metallurgie et la Construction Mecanique,* v. 90, Sept. 1958, p. 673-695.

History of process, description of furnaces using consumable electrodes. Possible future developments of this type of furnace. Application and results in metallurgy. (W18s)

547-W. (German.) **Technical Directives of the Five-Year Plan for Foundries.** W. M. Schestopal. *Freiberger Forschungshefte,* v. B24-3, 1958, p. 84-112.

Production engineering and floor plans. (W19, E-general; 18-67)

548-W. (German.) **Gutterless Low-Frequency Induction Furnaces.** *Giesserei Praxis,* no. 17, Sept. 10, 1958, p. 342-343.

Uniform heating and melting procedures, perfect control of alloy composition, uniform quality of melt as well as relatively low installation costs and good productivity recommend this type of furnace for foundries. (W18a)

549-W. (German.) **Ideal Sliding Surfaces on Machine Tool Castings.** J. Tanner. *Giesserei-Praxis,* v. 18, Sept.

25, 1958, p. 367-368.
(W25, Q9p, 5-60)

550-W. (German.) **Air Heating Plants in the Metal Industries.** K. G. Muller. *Metall,* v. 12, Sept. 1958, p. 830-836.

Central and individual heating plants combining heat source and heat carrier used to heat drying ovens of paint shops. (W10e, W4k)

551-W. (German.) **Water Economy of the Hoesch-Westfalenhutte AG, Dortmund.** Maximilian Zur. *Stahl und Eisen,* v. 78, Aug. 21, 1958, p. 1191-1200.

(W10h; ST)

552-W. (Russian.) **Operation of Continuous Furnaces With Low-Pressure Burners.** D. E. Krasnozhen. *Metallurg,* v. 3, Sept. 1958, p. 23-25.

Burners are inadequately distributed. There is particular need for more burners in upper zones of furnace. Since there is no room to install additional burners, the need for greater heat can be met by enlarging nozzles of present burners. (W20h, 1-61, F21b)

553-W. (Russian.) **Industrial Frequency Induction Furnace for Annealing Copper Pipes Prior to Cold Bending.** I. K. Kopylov. *Vestnik Mashinostroeniya,* v. 38, Sept. 1958, p. 34-35.

(W27k, J23; Cu-b, 4-60)

554-W.* **Aluminum-Bronze for Pump Construction.** *Canadian Metalworking,* v. 21, Oct. 1958, p. 36, 38.

Corrosion and abrasion during pump usage are being overcome now that improved molding and pouring techniques have enabled the qualities of Al bronze to be utilized for machining. Ge properties of Al-bronze, high-Pb-Sn bronze (1103), cast steel (1201) and cast 316 stainless steel (1203); table of liquids which can be pumped with Al bronze. (W13d, 17-57; Cu-s, *Al*)

555-W. **Recent Advances in the Metallurgy of Zirconium and Titanium Alloys of Special Interest in Reactor Technology.** G. M. Adamson, J. O. Betterton, J. H. Frye and M. L. Picklesimer. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1993, 1958, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Fabrication of Zircaloy-2 has been advanced by the development of a schedule which produces more nearly isotropic plate. Welding procedures now permit the field construction of complex structures of alpha Ti and perhaps Zr alloys. Zr alloys have been developed more resistant to radiation-induced corrosion in uranyl sulphate solution. 23 ref. (W11p, 17-57, F-general, K-general, R7k; Zr, Ti)

556-W. **Metal Fibers Beef Up Plastic Dies.** A. P. Maszucchelli. *American Machinist,* v. 102, Nov. 3, 1958, p. 94-95.

Longer wear, better heat properties and higher accuracy result when cast epoxy dies are filled with metal fibers. New technique where short fibers are flocked to outside wear surfaces improves die life. (W24n, H17; NM-d, 17-57)

557-W. **Continuous Heat Treatment With Automatic Control.** R. O'Donoghue and L. G. W. Palethorpe. *Automation Progress,* v. 3, Sept. 1958, p. 326-328.

Types of transfer furnaces; shaker hearth, rotating drum with helix walking beam, roller hearth. (To be continued.) (W27, W12r)

558-W. **Electric Furnace Developments.** P. F. Hancock. *Birmingham Metallurgical Society Journal,* v. 38, Sept. 1958, p. 89-104.

Review of construction, principal applications of direct arc, induction, resistor melting furnaces, induction heaters. (W18, 16-61)

559-W. **Hugh Vacuum Furnace for Degassing, Heat Treatment and Brazing of "Supermetals" at the North American Aviation Missile Plant.** *Industrial Heating,* v. 25, Oct. 1958, p. 1944-1946, 1948, 1950, 1952.

(W19c, D9k; ST)

590-W. Some Considerations Regarding Consumable-Electrode Inert-Gas Welding Filler Wire. L. M. Petryck. *Welding Journal,* v. 37, Nov. 1958, p. 1086-1089.

It is proposed the electrode wire be coiled to a specified diameter set or cast for more intimate contact at discharge end of contact tube to remedy erratic burn-off behavior. (W29h, K1d)

591-W. Tungsten Tool Steel Extruder Die Insert Ups Production 200%. *Western Metalworking,* v. 16, Sept. 1958, p. 45.

Hot work toolsteel for tube extrusion die insert where high compressive strength is required. Insert reaches 1000° F. in service. (W22a, 1-66; TS-k, *W, Cr*)

SECTION X

INSTRUMENTATION

Laboratory and Control Equipment

1-X. Nickel Alloys With Special Properties. C. Gordon Smith. *Birmingham Metallurgical Society, Journal,* v. 37, Sept. 1957, p. 553-565.

Ni and Ni-Fe alloys, their use because of low expansion properties in instruments, temperature control devices and glass-to-metal seals. Constant modulus alloys for watch hairsprings and magnetic alloys for permanent magnets and ultrasonic applications. (X general, 17-57; SGA-s, SGA-b, SGA-n, Ni)

2-X. Primary Elements for Temperature Measurement. H. G. Oughton. *Instrument Engineer,* v. 2, Oct. 1957, p. 76-82.

Construction and performance features of temperature-sensitive elements of resistance thermometer, thermocouple and radiation pyrometer types. (X9, 1-52)

3-X. (German.) **Trend in Design of Force Measuring Instruments on Testing Equipment.** G. Sachs. *Draht,* v. 8, Aug. 1957, p. 352-357.

Principles and systems for measuring forces in testing; combinations of hydraulic, mechanical and electric indicating mechanisms; magnitude of forces and desired precision of measurement determine the selection of the equipment. 5 ref. (X29, 17-51)

4-X. (Polish.) **Magnetic Plates in Telecommunication Industry.** T. Konopinski. *Hutnik,* v. 24, July-Aug. 1957, p. 311-317.

Ferrosilicon, ferronickel, ferrocobalt and ferroaluminum plates, their properties and application in telecommunication industry. 30 ref. (X15p, 17-57; SGA-n)

5-X. (Polish.) **Wound Cores and Cut-Out Patterns for Telecommunication Uses.** T. Konopinski. *Hutnik,* v. 24, July-Aug. 1957, p. 317-323.

Characteristics and application of ring, tape and plate cores. Problems of plate thickness and insulation selection for most suitable core shapes. 12 ref. (X15p, 17-7; SGA-n)

6-X. (Polish.) **Device for Measuring Power Loss of Continuous Transformer Plates.** J. Siewierski. *Hutnik,* v. 24, July-Aug. 1957, p. 333-334.

Basic characteristics of device built at Institute of Iron Metallurgy in Poland. 2 ref. (X26; SGA-r, AY)

7-X. Easier Check on Surface Finish. *British Steelmaker,* v. 23, Oct. 1957, p. 312-313.

Interference microscope for assessing metal surfaces easily estimates surface irregularities to 1 micro in. (X3q, S15)

8-X. Control of Atmosphere Generators. R. R. Swain. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 152-159.

Methods of sampling, measurement, analysis and control for exothermic and endothermic generators. Instruments for use with exothermic generator include fuel-air ratio meter, gas flow meter, specific gravity meter, combustibles analyzer and recording indicators and controllers; instruments used with endothermic generators include carbon dioxide and dew point analyzers. (X7g, X7j, W28q)

9-X.* An Apparatus for Measurement of the Occlusion of Hydrogen by Metals. M. Kotyk, J. K. Magor and H. M. Davis. *Metallurgia,* v. 56, Sept. 1957, p. 153-155.

Apparatus for determining amount of hydrogen occluded at various temperatures. 6 ref. (X21; H)

10-X. (French.) **Gamma Ray Device for the Detection of Cavities in Half-Run Products at Rolling Tempera-**

ture. A. Kohn. *Institut de Recherche de la Sidérurgie,* Publications, v. A. no. 163, July 1957, p. 1-23.

Device detects the large defects inside thick rolled products passing continuously from the roller through hard gamma radiation provided by a radiocobalt source. Measurements are made by new scintillation counter. 2 ref. (X8, X2, S19, W23)

11-X. (French.) **Instrument for Static Tests and Triaxial Stress Fatigue Tests.** G. Welter and A. Choquet. *Métaux-Corrosion-Industrie,* no. 383-384, July-Aug. 1957, p. 300-312.

Theory of deformation for tridimensional stress required experimental confirmation. Description of new instrument. 5 ref. (X29, Q27, Q7, 1-53)

12-X. (Russian.) **Electronographic Analysis in the Study of Metals.** M. I. Tsipin. *Metallobedenie i Obrabotka Metallov,* no. 5, May 1957, p. 62-64.

Instrument for study of molecular structures. (X3)

13-X. (Russian.) **Apparatus for Exact Determination of Electrical Resistance of Metals and Alloys at High Temperature in Vacuum.** S. D. Gertsriken and A. V. Prograshchenko. *Zavodskaya Laboratoria,* v. 23, Aug. 1957, p. 974-975.

(X25, P15g, 2-62, 1-73)

14-X. Precision Castings Guide Radar Signals. K. L. Herrick and Samuel Lipson. *Modern Castings,* v. 33, Jan. 1958, p. 29-31, 68.

Investment castings in the manufacture of wave guide components. (X15q, 17-57; 5-62)

15-X. True Stress Vs. Elongation Recorder. D. E. Driscoll and T. S. DeSisto. Watertown Arsenal Laboratory. *U. S. Office of Technical Services,* PB 131104, July 1955, 22 p. $.75.

Electronic extensometer and recorder that will autographically record the true stress versus elongation curve. It can be used on practically all ferrous and nonferrous metals. (X29p)

16-X. High Vacuum Filament Furnace for Gas Analysis of Metals. G. A. Consolazio and W. J. McMahon. Watertown Arsenal. *U. S. Office of Technical Services,* PB 131121, Oct. 1955, 13 p. $.50.

(X24f, S11r)

17-X.* Sampling and Analysis for Impurities in Liquid Sodium Systems. J. R. Humphreys, Jr. Paper from "Liquid Metals Technology", Pt. 1, Chemical Engineering Progress Symposium Series, p. 7-10.

Vacuum distillation apparatus and technique devised for sampling liquid sodium in reactor coolant systems and analyzing for oxides and metallic impurities. Equipment can be modified and used for Hg, Cs, Rb, K, Cd, Zn, Mg or Li. 13 ref. (X21m, 1-73, S11; 14-60)

18-X.* Production of Close-Tolerance Brass Strip. *Sheet Metal Industries,* v. 35, Jan. 1958, p. 55-59.

Baldwin Instrument Co. automatic nucleonic thickness gage control equipment installed on the Robertson four-high mill at the Birmingham Works of D. F. Tayler and Co., Ltd. (X20c, W23c, 1-52; Cu-n)

32-X.* Instrumentation for the Melting of Non-Ferrous Metals. D. W. Brown. *British Foundryman,* v. 51, Mar. 1958, p. 128-136.

Instruments available for combustion control, temperature measurement and control (especially thermocouples), nitrogen degassing gages, and melt-quality determination. (X9, X13, E10; EG-a38)

33-X. Three-Dimensional Toolmaker's Microscope. Walter P. Christoph. *Metalworking Production,* v. 102, Apr. 18, 1958, p. 684-686.

(X3r)

34-X. Measuring Tapers Without Tears. *Metalworking Production,* v. 102, Apr. 18, 1958, p. 688-690.

Device which simplifies difficult measuring problems. (X20a; ST)

35-X. Russian Automatic Machine Grades Cylinder Rollers. *Metalworking Production,* v. 102, Apr. 18, 1958, p. 691-692.

In roller grading machines at the Moscow automatic bearing plant, measuring airjets actuate solenoids to direct each roller into one of 23 hoppers according to a length of tolerance of 0.003 in. and a diameter tolerance of 0.00008 in. Production rate is 1800 rollers per hr. (X6, T7d; 18-74)

36-X. (German.) Strain Gages for Industry. Gisbert Kaliske. *Industrieblatt,* v. 58, Mar. 1958, p. 73-77.

Constructions of apparatus; measuring methods. (X28j)

37-X. (German.) Modern Gages and Controllers. *Industrieblatt,* v. 58, Mar. 1958, p. 83-85.

Impressions from International Congress on measuring techniques and automation in Dusseldorf, 1957. Short description of apparatus; strip thickness regulator, dosimeter for gamma and X-rays, controls using punched cards, electronic counting devices, electronic precision indicator, sorting device and noise tester. (X20, X2, X6)

38-X. (German.) Gages and Testing Apparatus for Efficient Manufacturing. *Industrieblatt,* v. 58, Mar. 1958, p. 85-87.

Precision gages, including screw gages, optical gages, "tool microscope", hardness testers, mounting and measuring projectors and sorting machines. (X20, X6)

39-X. (Russian.) Coercive-Force-Meter to Control Quality of Thermal Treatment of Steel Parts. A. M. Ylgard. *Zavodskaya Laboratoriya,* v. 23, no. 12, 1957, p. 1054-1505.

(X11, J-general, S13h; ST)

40-X. Autographic Stress-Strain Recorders. Raymond R. Bouche and Douglas R. Tate. *ASTM Bulletin,* no. 228, Feb. 1958, p. 33-42.

93 ref. (X29q)

41-X. Strain Stress Computer. Thomas S. DeSisto and David E. Driscoll. *ASTM Bulletin,* no. 228, Feb. 1958, p. 46-49.

(X29q)

42-X.* A New Dynamic Test Facility for Aqueous Corrosion Studies. S. Greenberg, J. E. Draley and W. E. Ruther. *Corrosion,* v. 14, Apr. 1958, p. 191t-192t.

New high-pressure, high-temperature dynamic aqueous corrosion test

loop. Maximum operating conditions are 360° C., 3000 psi., 20 to 30 ft. per sec. velocity. Design allows flexibility of operation and precise control of corroded composition. (X1c, R4)

43-X. Apparatus for Determination of Hydrogen in Steel. Lars Bjerkerud. *Jernkontorets Annaler,* v. 141, no. 2, 1957, p. 90-94. (Iron and Steel Institute Translation no. 613.)

Previously abstracted from original. See item 49-X, 1957. (X21, 1-2, S11; ST, *H*)

44-X. (German.) **Foil Thickness Meter.** W. Hellwig. *Aluminium,* v. 34, Apr. 1958, p. 206-207.

Two meters, one for thick strip and the other for foil make contact with the stock and convert mechanical changes into electrical signals which are recorded. (X20c, S14c, F23, 4-56)

45-X. (Russian.) **More Efficient Calibration of Hexahedral Rolled Steel.** A. A. Nefedov and B. M. Ilyukovich. *Metallurg,* v. 3, Mar. 1958, p. 22-24.

(X20, W23; ST)

46-X. (Russian.) **New Machines for Testing Strength of Metals.** B. A. Avdeev. *Zavodskaya Laboratoriya,* v. 24, Feb. 1958, p. 253-254. (X29, 1-52, Q27)

47-X. Apparatus for Measuring the Depth of Cracks. Lutz Brand. *Stahl und Eisen,* v. 77, May 2, 1957, p. 576-581. (Iron and Steel Institute, Translation no. 621.)

Previously abstracted from original. See item 53-X, 1957. (X8, 1-52, 9-72)

48-X.* (German.) **Measurement of X-Ray Interference Curves With the Scintillation Counter.** Hermann Moller and Friedhelm Brasse. *Archiv für das Eisenhüttenwesen,* v. 28, Dec. 1957, p. 831-837.

Tests with the scintillation counter for the measurement of intensities in X-ray interference lines resulted in considerable advantages over the conventional Geiger-Muellr counter. The efficiency was ten times higher, permitting three times higher counting accuracy. A differential discriminator provided for the suppression of cosmic rays and of the impulses emitted from the secondary electron amplifier. 19 ref. (X2c)

49-X.* Methods of Control of Strip Dimensions on Hot Finishing Mills. R. A. Phillips. *Iron and Steel Engineer,* v. 35, May 1958, p. 100-106.

To hold finishing dimensions, hot strip mill must be set up accurately and stand speed regulated accurately. For this, positioning controls on screwdowns and speed regulators are necessary. Some type of automatic set-up of both screwdowns and speeds is foreseen. 5 ref. (X20c, W23c, 1-66)

50-X. An Apparatus for Measurement of Thermal Conductivity of Solids at Low Temperatures. Robert L. Powell, William M. Rogers and Don O. Coffin. *National Bureau of Standards, Journal of Research,* v. 59, Nov. 1957, p. 349-355.

7 ref. (X24, P11h, 1-53, 2-63)

51-X.* The Adiabatic Vacuum Calorimeter From 600 to 1600° C. I. I. Backhurst. *Iron and Steel Institute, Journal,* v. 189, June 1958, p. 124-134.

Upper temperature limit of the adiabatic vacuum calorimeter has been extended from 950 to 1600° C. It is adapted for either solid or liquid metal specimens and has been applied to the measurement of the thermal capacities of Ti from 590 to 1080° C., a 44% Cr-Fe alloy from 500 to 1100° C. and an alloy steel (1.09% Cr, 0.69% Mn, 0.315% C, and 0.20% Si) from 540 to 1600° C. 12 ref. (X24e, P11; Ti, Cr, Fe, AY)

52-X.* Three-Dimensional Tape-Controlled Inspection System. H. J. Elton. *Machinery (London),* v. 92, June 6, 1958, p. 1329-1332.

To permit continuous and automatic inspection of workpieces in three dimensions, a special measuring head has been developed which is sensitive to both vertical and horizontal deflections of the stylus. This head may be mounted on a machine arranged for automatic tape control, and the component may be caused to follow a path such that the various surfaces to be inspected are carried past the stylus. (X20, 1-52)

53-X. The Use of a Computer in a Rolling Mill Office. R. G. Massey. *Process Control and Automation,* v. 5, May 1958, p. 190-195.

Work carried out by the Operational Research Department of the British Iron and Steel Research Association. (X14, 1-52, F23, A9)

54-X.* (Russian.) **Instruments for Maximum Geometric Measurements, Accessory Electromagnets for Coercive Force Meters Used for Control-**

ling Quality of Thermal and Chemico-Thermal Treatment of Steel and Cast Iron Products. M. N. Mikheev. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 44-52.

Coercive force meters equipped with accessory electromagnet can be used for accurate control of quality of heat treated products. All ranges of sizes of products encountered may be controlled whose hardened layer may vary from the thinnest nitrided layer to cases of considerable thickness. The instrument and process. 22 ref. (X11, 1-53, J28; ST, CI)

55-X. Inspecting the Micro-Inch Surface Finish. *Australasian Manufacturer,* v. 42, Mar. 15, 1958, p. 44-50. (X3q, 1-53, S15)

56-X. Differential Calorimeter for Heats of Formation of Solid Alloys. Heats of Formation of Alloys of the Noble Metals. R. A. Oriani and W. K. Murphy. *Journal of Physical Chemistry,* v. 62, Mar. 1958, p. 327-331.

A twin differential, high-temperature calorimeter. Experimental results for the enthalpy of formation of solid Ag-Au, Au-Cu and Ag-Cu alloys.
(X24e, P12r; Ag-b, Au-b, Cu-b)

57-X. (French.) **A New Surface Irregularity Measuring Instrument.** E. Fukushima. *Métaux-Corrosion-Industries,* no. 391, Mar. 1958, p. 125-132.

Instrument is based on the principle of optical reflection and its principal advantage is therefore freedom from vibrations such as encountered in instruments based on direct needle tracing of surface irregularities. Other advantages are rapidity of measurements, portability, ability to test directly and non-destructively with no special specimens required. Instrument gives a statistical measure of surface irregularities. 6 ref.
(X23p, S15d, 1-53)

58-X. (German.) **Platinum in Chemical Laboratory Apparatus.** Manfred Röhm. *Chemi für Labor und Betrieb,* v. 9, Apr. 1958, p. 144-148. (X21, 17-57; Pt)

59-X.* An Automatic Gage Control System for Tandem Cold Mills. N. S. Walker, J. W. Cook and J. W. Wallace. *Iron and Steel Engineer,* v. 35, July 1958, p. 124-132.

Controller consisting of pre-amplifier, integrator and power amplifier is standard in design and can be applied to any steel rolling mill where gage can be controlled by tension; applicable to Al mills where gage is controlled by tension or mill speed, or by a combination of both. (X20c, W23)

60-X.* Temperature Controller for Heat-Treatment of Pipe Welds. D. Birchon. *Welding and Metal Fabrication,* v. 26, July 1958, p. 256-258.

Prototype portable instrument to control the heat-treatment temperature of local areas of completed structures in the temperature range 600° C. upwards, within 10° C. The equipment views a small area of the hot surface directly through the heating flame, and on opposed current control circuit which gives a full-scale meter deflection for the working range of 600-900° C. 5 ref.
(X9s, J-general, 4-60, 7-51)

61-X.* (German.) **Surface Treatment of Aluminum for Electrolytic Condensers.** P. Werner. *Nachrichtentechnik,* v. 8, June 1958, p. 269-276.

Surface treatment of Al is one of the most important aspects in the production of condensers; a reduction in the size of the case is made possible for the miniature type used in communications. Methods of treatment are mechanical, spraying, chemical and electrochemical. The electrochemical process has the best reproducibility.
(X15, T1e, L-general; Al-b, 17-57)

62-X.* (German.) **Experiments and Observations on the Development of an Oxide-Type Thermo-Element.** Wilhelm Anton Fischer and Gert Lorenz. *Archiv für das Eisenhüttenwesen,* v. 29, May 1958, p. 293-300.

For the measurement of temperatures between 300 and 1750° C. thermo-elements from $Pt/Cr_2O_3/Cr_2O_3 + 1\%\ TiO_2/Pt$ representing a semiconductor were tried and thermoforces and thermovoltages were observed. Reversibility and reproducibility were satisfactory even after 24 hr. of heating. The thermovoltages were extrapolated up to 2100° C., beyond which the thermoforces apparently become negligible. Tables and diagrams are given for thermoforces and voltages as function of temperature. 12 ref.
(X9g, 17-57; Cr, Pt, Ti)

63-X. (German.) **Application of Scintillation-Counters on "Counting Tube Goniometers".** Franz Bollenrath and Hans Krings. *Archiv für das Eisenhüttenwesen,* v. 29, May 1958, p. 309-312.

For microstructure investigations on Cu, Al, carbonyl iron and on steels with about 16% Cr and 30% Ni, a sodium iodide scintillation counter together with molybdenum rays was used. The ratio between line intensity and background intensity was improved, permitting a considerably better discrimination against fluorescent rays and retarding rays. Types of counting instruments are compared in tables. 5 ref. (X27c, M23n; SS, *Cr, Mo, Ni*)

83-X. A Rotatable-Magnet Permeameter. R. K. Tenzer and M. A. Bohlmann. Indiana Steel Products Co. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131352, July 1956, 9 p. $.50.

Permeameter which derives the variable magnetomotive force across its air gap from the rotation of a permanent magnet. In the common permeameter, the variable magnetic field is provided by an electric current. The general purpose of the device is the determination of the magnetic properties of a test specimen and, in particular, visual indication of the major or minor hysteresis loops of a test specimen under varying magnetic field conditions. (X26, 1-53)

84-X. An Eddy Current Thickness Tester for Copper Plated on Uranium. Arthur P. Holt and Louis H. Cook. *U. S. Atomic Energy Commission DP-252,* 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Instrument measures thickness by the eddy current principle and is usable in the range of 0.004 to 0.012 in. with an accuracy of 5%. With minor modifications and adjustments the instrument may also be used to measure thicknesses as great as 0.035 in., of either Cu or Al, on any substrate whose specific resistivity approximates that of U. (X20c, 1-69; Cu, U, 8-62)

85-X. State of Development of Thermal Radiometer. A. Pfenninger, H. E. Henry, M. Godet and C. A. Wogrin. Quantum Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131746, Mar. 1958, 57 p. $1.50.

Design and manufacture of the components of a thermal radiometer; mathematical analyses of heat transfer and control system problems. Forming a cone by electroforming technique. Adhesives of epoxy resins filled with Al powder developed to bond wires onto the system's Cu sink. (X2, 17-57, L18, K12)

86-X Electrical Strain Measurements at High Temperatures. James E. Starr. Paper from "Sheet Materials for High-Temperature Service", American Society for Metals, 1958, p. 37-50.

Three most important characteristics of resistance material for precision resistor application are temperature coefficient of resistance stability and high resistivity. Stability of several well-known strain gage alloys. (X28j, 17-57)

92-X.* (German.) **Temperature Measuring Equipment.** H. Kluge. *Giesserei Praxis,* no. 16, Aug. 25, 1958, p. 316-319.

Importance of accurate temperature measuring for all installations producing or utilizing heat. Depending on temperatures involved or materials concerned, certain instruments can be used, operating on electrical, optical and sometimes chemical principles. Metals and metal-alloys which make up these devices decide range of temperatures within which devices can be applied. Resistance thermometers, thermocouples, pyrometers described. (X9)

93-X.* **Width Meters Trim Strip Waste.** *Steel,* v. 143, Oct. 20, 1958, p. 182, 185.

A width gage uses photocell detectors which follow the edges of the hot strip by the radiation they emit. Eectromechanical circuitry translates what the photocells see into a running record of strip width. A new width meter uses a split beam of light from a point source, instead of radiation from the strip itself, to monitor the width of the strip. (X20, W23c, 1-53)

94-X. **Army Uses Sun.** *Chemical and Engineering News,* v. 36, Oct. 13, 1958, p. 35-36.

Description of solar furnace, proposed applications. (X24f, 16-63)

95-X. **An Instrument for the Measurement of Stress in Electrodeposits.** T. P. Hoar and D. J. Arrowsmith. *Institute of Metal Finishing, Transactions,* v. 43, 1956-1957, p. 354-368.

Metal is deposited on one side of a thin metallic strip fixed at the bottom; to the top is attached a light armature of soft iron. The stress in the deposit is determined by measuring the current through a solenoid that provides a restoring force on the armature to prevent the strip from bending. 7 ref. (X29q, Q25, 8-62)

96-X. **A High Temperature Centrifuge for Creep, Rupture, and Bend Tests.** I. I. Kornilov. *Journal of Metals,* v. 10, Mar. 1958, p. 187-189. 13 ref. (X20k, Q3q, Q5, 1-53)

97-X. (Italian.) **Determination of Total Water Content and Humidity in Electrode Coverings.** R. Botisk and F. Corbelli. *Rivista Italiana della Saldatura,* v. 10, Mar-Apr. 1958, p. 45-50.

Three methods (Gayly and Wooding, Jannasch and Fischer) used to determine total water content of basic electrode coverings; one (Gorbach) to determine humidity. Techniques and apparatus. (X21, W29h)

98-X. **Automation of Cupola Charging and Stockline Control With the Use of Radioisotopes.** G. K. Miroshnichenko. *Liteinoe Proizvodstvo,* no. 8, Aug. 1957, p. 14-15. (Henry Brutcher, Altadena, Calif., Translation no. 4341.)

Previously abstracted from original. See item 25-X, 1958.
(X13f, W18d; 1-59, 18-74)

99-X. (German.) **New Developments in Radiography and Image Intensification.** Heinrich Nassenstein. *Schweissen und Schneiden,* v. 10, Sept. 1958, p. 376-379.

Xeroradiographic method, superconoscope, solid-state light amplifier. 11 ref. (X2, S19)

100-X. **Total Radiation Pyrometers.** *Castings,* v. 4, Sept. 1958, p. 32-34.

(X9r, S16b)

101-X. New Techniques Revealed at West Coast Lubrication Conference. Ernest Rabinowicz. *Product Engineering,* v. 29, Nov. 10, 1958, p. 84, 85.

Radioactive tracers, interference microscopy, high-speed computers in bearing and lubrication research. (X3q, X14, T7d, 1-54, 1-59; NM-h)

102-X. A Large Metal System Permitting Low Base Pressures. J. Ralph Ullman. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, 1958, p. 95-96.

(X13e, 1-73)

103-X. Production of Very Low Pressures With Getter-Ion Pumps. G. Reich and H. G. Noller. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, 1958, p. 97-99.

(X13e, 1-73)

104-X. A Magnetic Amplifier Control Circuit for a Thermal Conductiy-ity Vacuum Gauge. Allen R. Hamilton. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, 1958, p. 112-114.

(X12p)

105-X. A New Type of Vacuum Leak Detector. F. L. Torney, Jr. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, 1958, p. 115-119.

Operational characteristics of halogen sensing elements and their influence on electronic circuit designs. Advantages. (X12s)

106-X. Apparatus for Measuring the Depth of Cracks. Lutz Brand. *Stahl und Eisen,* v. 77, May 2, 1957, p. 576-581. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB41.)

Previously abstracted from original. See item 53-X, 1957.

(X8, 1-52, 9-72)

107-X. (German.) **Material Testing Instrument.** *Technik und Betrieb,* v. 10, July 1958, p. 103.

Steel tested with a thermocouple. (X9q, S11g; ST)

SUBJECT INDEX

Since the annotations in this book are grouped into broad classes on the basis of process or property, the major emphasis in the index has been placed on materials, products and applications. Entries under the names of processes and properties usually refer only to general treatments of the subject. Wherever possible, items have been indexed under the name of the material or the type of material (metals, alloys, and metal forms) or product. For example, material on the rolling of aluminum appears as a subhead under the main entry "Aluminum alloys," and not under the main entry "Rolling." Similarly, material on the welding of steel plates in shipbuilding appears under the main entry, "Ships" rather than under the main entries "Welding" or "Steel plates." In general, subject entries conform to the usage in the "ASM-SLA Metallurgical Literature Classification," published by the American Society for Metals, 1950; Revised Edition, 1959.

Alloy systems in which one member is predominant are indexed under that member only. Where two or more members share predominance, entries have been made under each member.
